# Introduction

The Check Point CPView service runs on a Check Point server. For information about CPView, see [sk101878](#).

Skyline quickly and efficiently monitors your Security Gateways with industry-standard software and protocols (OpenTelemetry, Prometheus Server, and Grafana Server).

Skyline provides an OpenTelemetry Agent for the Check Point CPView service.

This OpenTelemetry Agent collects and exports health metrics from CPView.

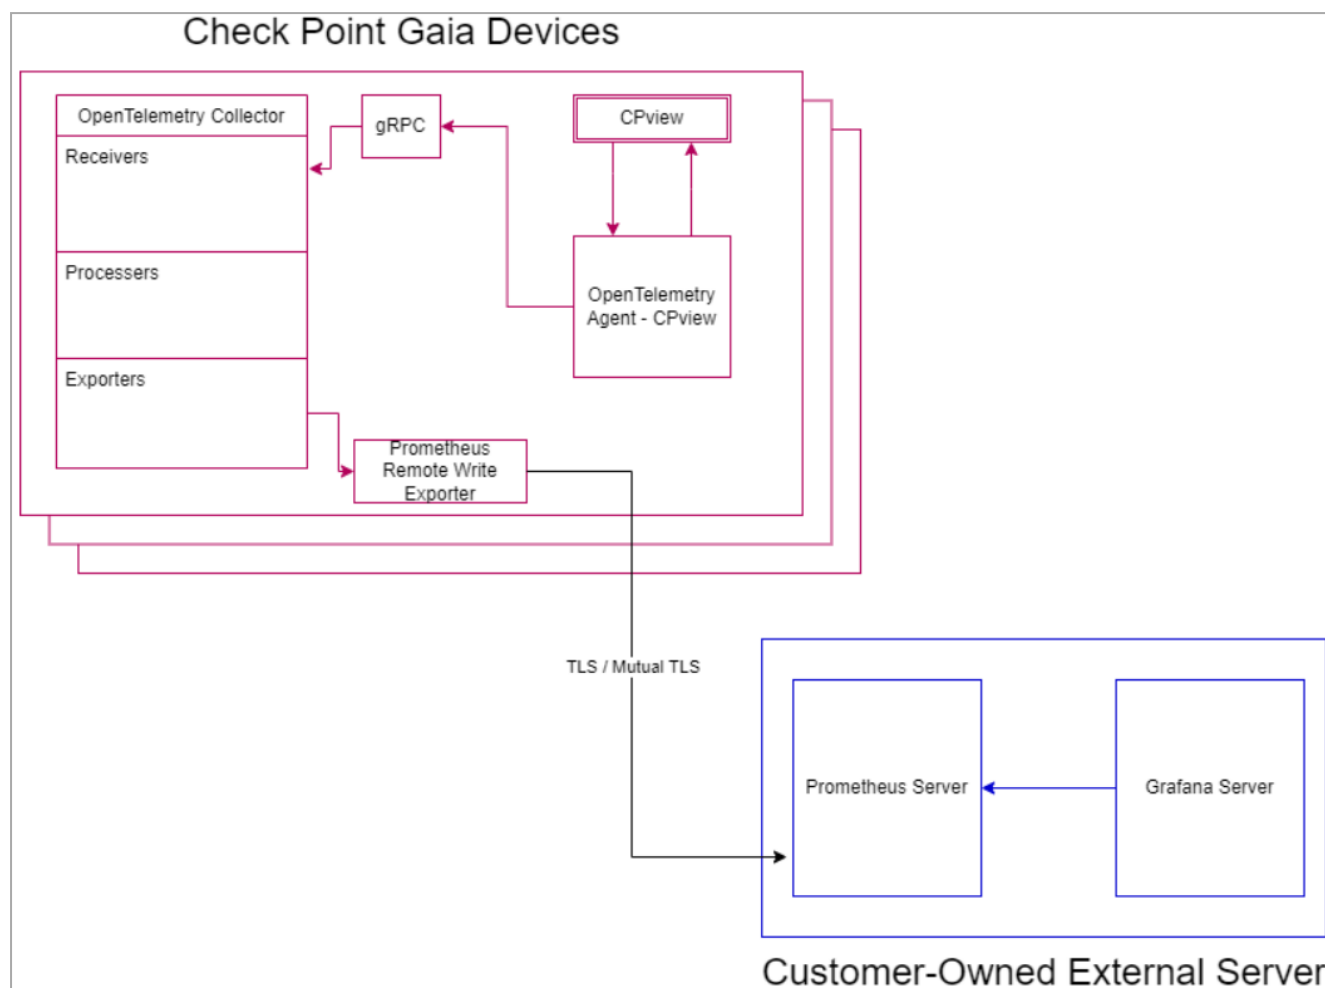

## Skyline Architecture

The Skyline architecture includes three primary components:

Component	Description
CPView OpenTelemetry Agent	Runs on Check Point servers. A service that queries CPView at defined intervals, collects the metrics, and exports them to an OpenTelemetry Collector. See <a href="#">sk181615 - OpenTelemetry Agent (OtlpAgent) Release Updates</a> .
OpenTelemetry Collector	Runs on Check Point servers. An open-source service that receives metrics from multiple agents and exports them to an external endpoint (a different OpenTelemetry Collector or a Prometheus Remote-Write). See <a href="#">sk180522 - OpenTelemetry Collector (CPotelcol) Release Updates</a> .
Storage Location	Third-party software that runs on an external server, to which an OpenTelemetry Collector sends the exported metrics. The Prometheus Server receives data from the OpenTelemetry Collector, saves it in a Timeseries Database, and visualizes the data with visualization tools like Grafana. Other third-party monitoring tools are also supported.

In addition, see [sk180521 - OpenTelemetry CPviewExporter Release Updates](#).

Logical Diagram:

## Skyline Requirements

See [sk178566](#) > section "Requirements".

## Skyline Downloads

See [sk178566](#) > section "Downloads".

## Skyline Known Limitations

See [sk178566](#) > section "Known Limitations".

# Skyline Configuration

See:

- ["Skyline Configuration on Check Point Servers that run Gaia OS - Prometheus with Grafana" on page 17](#)
- ["Skyline Configuration on Check Point Servers that run Gaia OS - Other Monitoring Tools" on page 38](#)
- ["Skyline Configuration on Quantum Spark Appliances" on page 51](#)

# Skyline Troubleshooting and FAQ

See [sk179870](#).

# Skyline Metrics

See ["Skyline Metrics Repository" on page 64](#).

# Skyline Configuration on Check Point Servers that run Gaia OS - Prometheus with Grafana

 **Note** - This section provides the steps for the Prometheus Server and the Grafana Server.

For other monitoring tools, see "[Skyline Configuration on Check Point Servers that run Gaia OS - Other Monitoring Tools](#)" on page 38.

This section applies to these Check Point Servers:

- Security Gateways / VSX Gateways.
- ClusterXL Members.  
In a Cluster, you must configure all the Cluster Members in the same way.
- Security Groups on Scalable Platforms (ElasticXL Cluster, Maestro, and Scalable Chassis).
- Security Management Servers.
- Multi-Domain Security Management Servers.
- Multi-Domain Log Servers.
- Log Servers.
- SmartEvent Servers.
- Endpoint Security Management Servers.
- Endpoint Policy Servers.

## Video Tutorial

<https://www.youtube.com/watch?v=FO2Rp9x31i0>

# Step 1 - Install the Prometheus Server

 **Note** - Skip this step if you have already installed the Prometheus Server

## Procedure

### Installing a Prometheus Server

To install a Prometheus Server on the external server, refer to [the Prometheus installation instructions](#) for the various platforms.

### Prometheus Server Default URL

```
http://localhost:9090
```

### Configuring a Prometheus Server

1. **Mandatory:** On the Prometheus Server, enable its Remote Write Receiver to get metrics data from the Check Point Servers. Refer to [these Prometheus instructions](#).
2. **Optional:** Use TLS Encryption and Basic authentication to secure the connection between the Prometheus Server and the OpenTelemetry Collector.

#### Instructions

The Prometheus Server and OpenTelemetry Collector support Transport Layer Security (TLS) encryption for their connection. Refer to [these Prometheus instructions](#).

Check Point also requires you to enable basic authentication to make the security bi-directional, refer to [these Prometheus instructions](#).

TLS configuration has two main components:

- A pair of a Key and a Certificate, used to encrypt your communication.
- (Optional) Certificate Authority (CA) that you trust, used to verify and trust the certificate of the other endpoint with which you communicate. If the certificate of the other endpoint is unknown to the CA, the communication is rejected.

You can create these certificates:

- CA-signed certificates: You create a key and a certificate request, which is then signed by the CA.

- Self-signed certificates: You create a key and a certificate that is signed by the user.

The steps below describe a self-signed certificate.

To configure TLS, you must create two pairs of a key and a certificate on the Prometheus Server:

- a. Create a self-signed certificate and a private key on the Prometheus Server:
  - i. Create the file called `openssl.conf` with the template below.

Enter the applicable information in the "[ dn ]" and "[ alt\_names ]" sections.

 **Important** - The Prometheus Server and the OpenTelemetry Collector must have different hostnames and IP addresses.

Template:

```
[ req ]
default_bits      = 4096
default_md        = sha256
req_extensions    = v3_req
distinguished_name = dn
prompt = no

[ v3_req ]
subjectAltName = @alt_names

[ dn ]
C = <Country Name>
ST = <State Or Province Name>
L = <Locality>
O = <Organization>
OU = <Organization Unit>
CN = <Common Name>

[ alt_names ]
DNS = <HOSTNAME>
IP = <IP ADDRESS>
```

- ii. Generate the key and certificate pair on any Gaia OS server (in the Expert mode):

```
copenssl req -x509 -newkey rsa:4096 -nodes -  
config openssl.conf -keyout mykey.key -out  
mycert.crt -extensions v3_req
```

This command creates two files in the current working directory:

- mykey.key
- mycert.crt

Move these two files from the Gaia OS server to the Prometheus Server.

- b. Use the newly generated key and certificate file to configure TLS on the Prometheus Server in the `web-config.yaml` configuration file (**you may need to create this file**).

Example of a `web-config.yaml` file:

```
tls_server_config:  
  key_file: /home/admin/mykey.key  
  cert_file: /home/admin/mycert.crt
```

## Step 2 - Install the Grafana Server

 **Note** - Skip this step if you have already installed the Grafana Server.

### Procedure

#### Installing a Grafana Server

To install a Grafana Server on the external server, refer to [the Grafana installation instructions](#).

 **Note** - You can install the Grafana Server on the same server that contains your Prometheus Server instance.

#### Grafana Server Default URL

```
http://localhost:3000
```

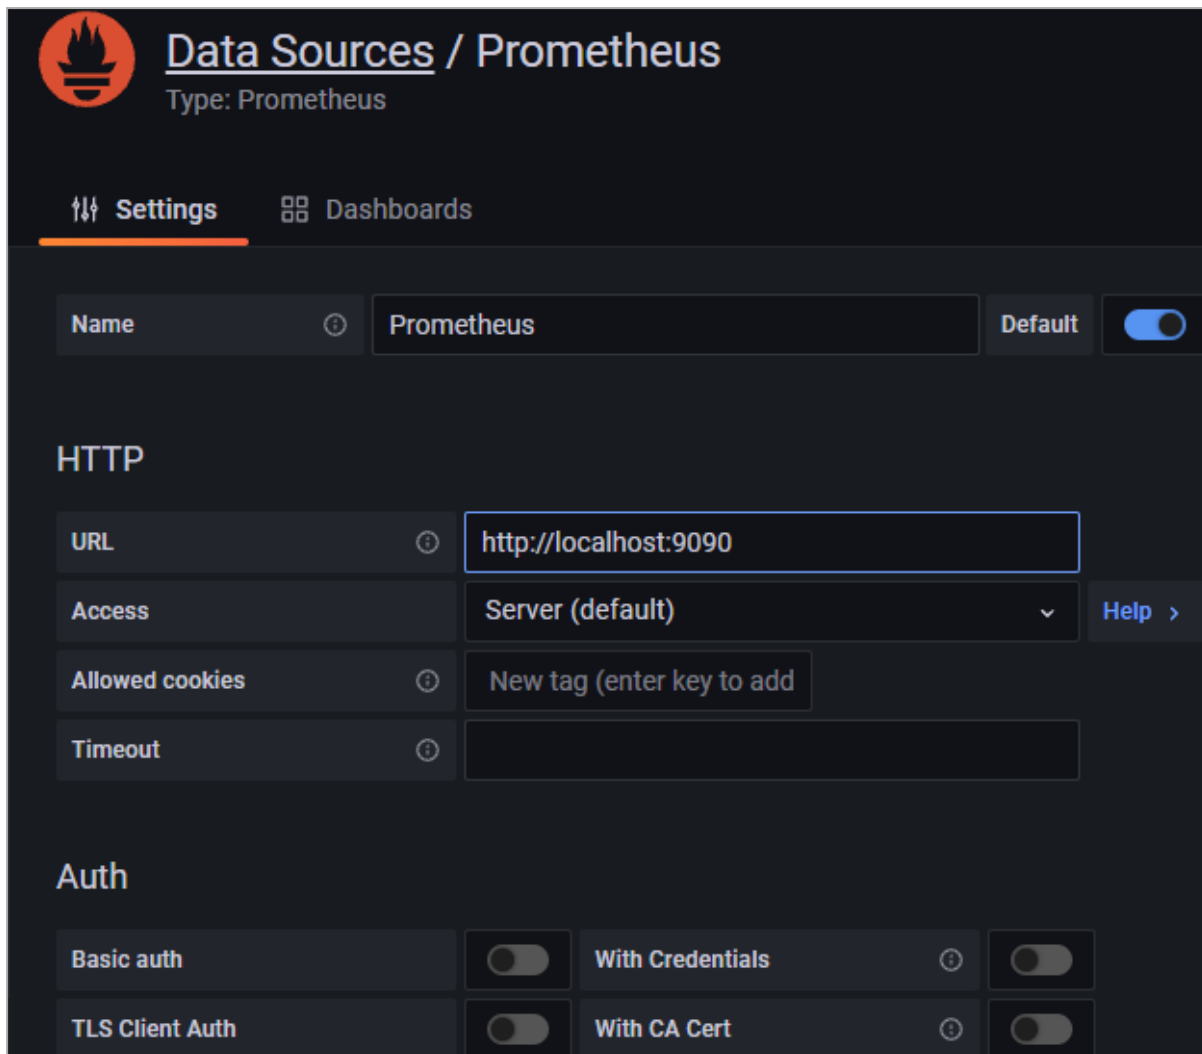

#### Configuring a Grafana Server (connecting Data-source and Dashboards)

1. Log in to Grafana and add a new Prometheus Data Source with the Prometheus Server you created.

On the side panel, click **Configuration > Data sources** > click the **Add data source** button > select the **Prometheus** data source.

Make sure to mark the Prometheus data source as **Default**.

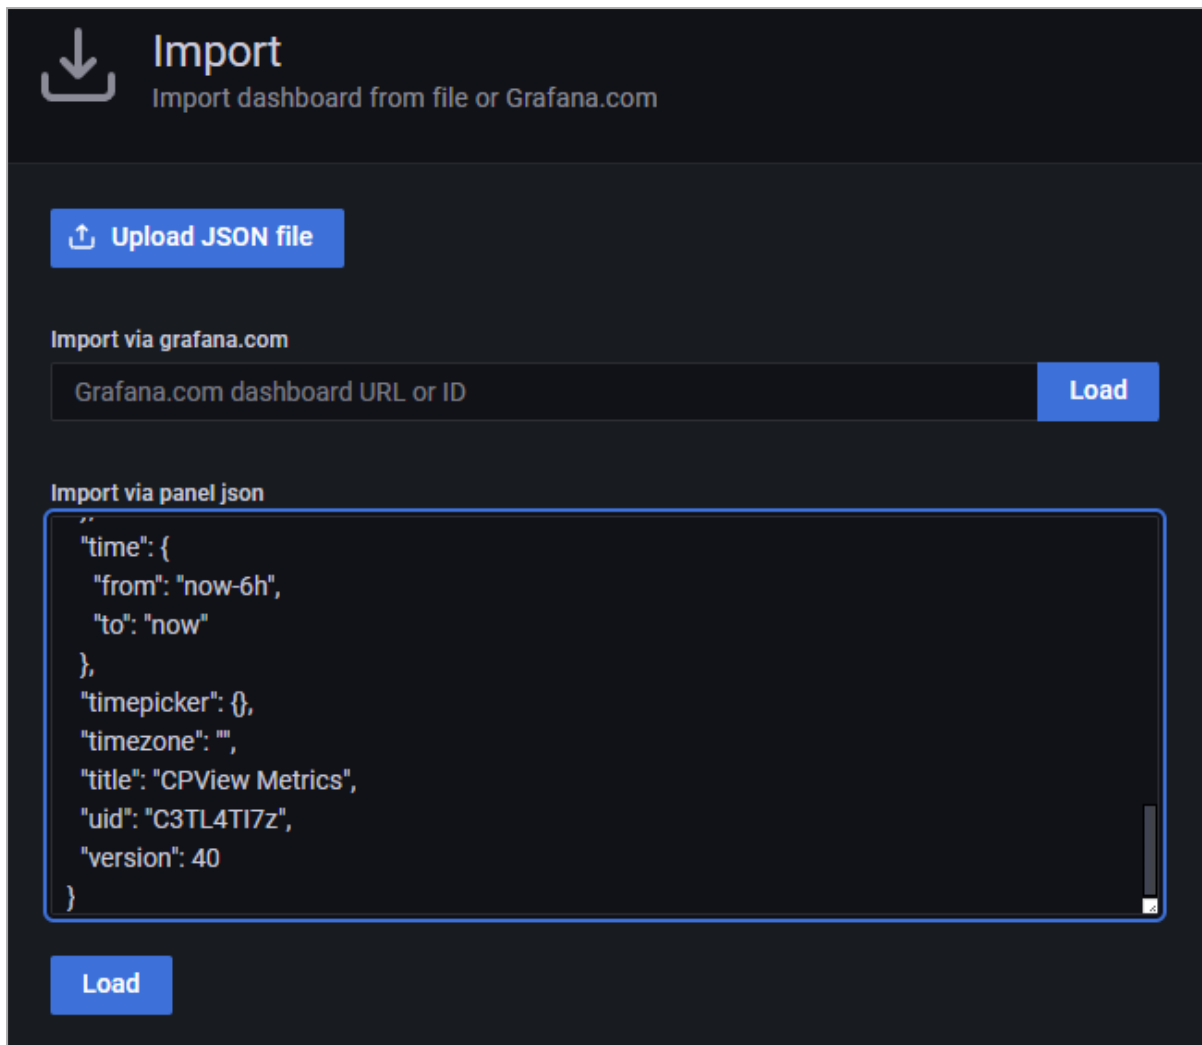

Example:

2. Import the Check Point Grafana dashboard to start monitoring your environment.

On the side panel, click **Create > Import** > upload the applicable JSON file for a dashboard.

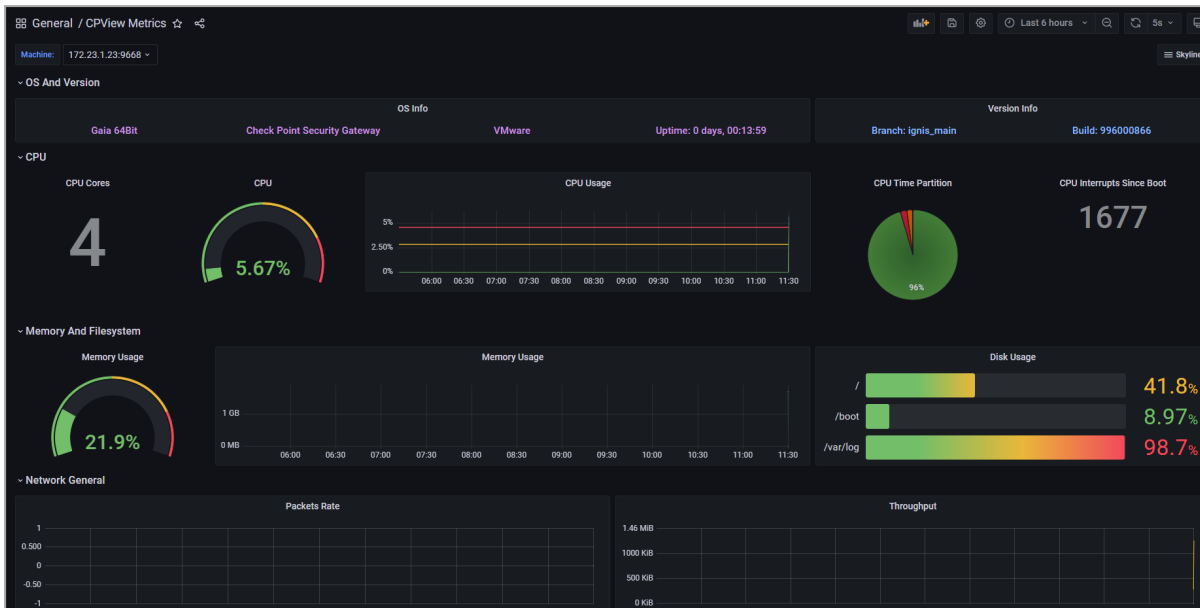

Example:

3. You can modify the existing dashboards or create new dashboards according to your needs.

To see a full description of all the data exposed by Skyline, see ["Skyline Metrics Repository" on page 64](#).

Example:

# Step 3 - Install the OpenTelemetry Agent and OpenTelemetry Collector on the Check Point Server

## Procedure

### On an online Check Point Server:

The OpenTelemetry Agent (`OtlpAgent`) and the OpenTelemetry Collector (`CPotelcol`) packages are installed automatically on all applicable Check Point Servers, if you allowed the Automatic Update downloads as described in [sk94508](#).

### On an offline Check Point Server:

The minimum required OpenTelemetry Agent and OpenTelemetry Collector packages are also installed as part of the Jumbo Hotfix Accumulator installation.

See [sk178566](#) > section "Requirements".

### Related offline update packages:

- [sk180522 - CPotelcol \(OpenTelemetry Collector\) Release Updates](#)
- [sk180521 - CPviewExporter Release Updates](#)

# Step 4 - Configure the OpenTelemetry Collector on the Check Point Server to work with the Prometheus Server

## Important Notes

### Important:

- Do not cut and paste the commands below. Enter them manually.
- In a Cluster, you must configure all the Cluster Members in the same way.
- In Management High Availability, we recommend to configure all the Management Servers in the same way.
- On a Maestro Orchestrator (MHO):  
You can run the CLI command "sklnctl" (in the Expert mode) or run the Gaia REST API command (requires Gaia API v1.7 or higher).  
The CLI command runs on the Orchestrator and configures only the Orchestrator.
- In a Scalable Platform Security Group:  
You can run the CLI command "g\_all sklnctl" (in the Expert mode) or run the Gaia REST API command (requires Gaia API v1.7 or higher).
- For the applicable Gaia REST API commands, refer to the [Check Point Gaia API Reference](#) (v1.7 and higher):
  - In Gaia API v1.8 and higher: Section "*Diagnostics*" > Section "*OpenTelemetry*".
  - In Gaia API v1.7: Section "*OpenTelemetry*".

This step provides two different procedures - for an on-premises Prometheus Server, and for a Prometheus Server in AWS.

**Procedure to work with an on-premises Prometheus Server**

## 1. Prepare the required payload for the command:

**i** Notes:

- Download the sample payload files from [sk178566](#) > section "Downloads".  
Replace the placeholder strings "< . . . >" in the sample files with your actual strings.
- In the "basic" section, configure the "username" and "password" attributes to your monitoring server's username / password.  
The "password" attribute supports only these characters:
  - uppercase letters (A-Z)
  - lowercase letters (a-z)
  - digits (0-9)
  - underscore (\_)
  - comma (,)
  - period (.)
  - backslash (\)
  - slash (/)
  - hyphen (-)
- In the "ca-public-key" section, configure the TLS settings with the CA certificate of your monitoring server (as PEM X509), or use the self-signed certificate you generated previously.  
Replace "<CERTIFICATE>" with the CA certificate of the monitoring server (PEX X509) - paste the entire string:

```
-----BEGIN CERTIFICATE-----<BASE64_TEXT>-----END
CERTIFICATE-----
```

- In the "url" attribute, configure your monitoring server's IP address / URL.  
If you do not wish to use TLS encryption in labs or test environments, then make these changes in the payload:
  - a. In the "url" attribute, change the URL protocol from "https://" to "http://".
  - b. Remove the "client-auth" and "server-auth" attributes.  
Note - When you apply the payload, this warning appears: "it is recommended to have both client and server authentication".

## Example JSON payloads:

### Example payload - connection with TLS

```
{
  "enabled": true,
  "export-targets": {
    "add": [
      {
        "client-auth": {
          "basic": {
            "username": "<USERNAME>",
            "password": "<PASSWORD>"
          }
        },
        "enabled": true,
        "server-auth": {
          "ca-public-key": {
            "type": "PEM-X509",
            "value": "<CERTIFICATE>"
          }
        },
        "type": "prometheus-remote-write",
        "url": "https://<EXTERNAL_PROMETHEUS_IP_ADDRESS>:9090/api/v1/write"
      }
    ]
  }
}
```

### Example payload - connection without TLS

```
{
  "enabled": true,
  "export-targets": {
    "add": [
      {
        "enabled": true,
        "type": "prometheus-remote-write",
        "url": "http://<EXTERNAL_PROMETHEUS_IP_ADDRESS>:9090/api/v1/write"
      }
    ]
  }
}
```

2. Run the configuration command to apply the payload - either the CLI command (in the Expert mode), or the Gaia REST API command:

- Method 1 - Run the CLI command "sklnctl":
  - a. Save the JSON payload in a file (for example, /home/admin/payload.json).
  - b. On a Scalable Platform Security Group, copy the JSON payload file to all Security Group Members:

```
asg_cp2blades /home/admin/payload.json
```

- c. Run this command:

- On a Security Gateway / each Cluster Member / Management Server / Log Server / SmartEvent Server:

```
sklnctl export --set "$(cat /home/admin/payload.json) "
```

- On a Scalable Platform Security Group:

```
g_all sklnctl export --set "$(cat /home/admin/payload.json) "
```

- Method 2 - Run the Gaia REST API command "set-open-telemetry" (requires Gaia API v1.7 and higher):

```
POST{server}/v1.7/set-open-telemetry
Content-Type: application/json
X-chkp-sid: {{session}}
{
  <JSON Payload>
}
```

** Note** - To disable Skyline completely:

- a. Change the value of the "enabled" attribute in the JSON payload file:
  - from "enabled": true
  - to "enabled": false
- b. Run the API command again

## Procedure to work with a Prometheus Server in AWS

1. Prepare the required payload for the command:

 **Notes:**

- Refer to the AWS official documentation for detailed information about how to generate the keys.
- The Session Token is optional.

To work with a single Export Target over HTTPS:

```
{
  "enabled": true,
  "export-targets": {
    "add": [
      {
        "server-auth": {
          "sigv4auth": {
            "region": "<Region>",
            "aws-access-key-id": "<Access Key
ID>",
            "aws-secret-access-key": "<Access
Key>",
            "session-token": "<Session Token>"
          }
        },
        "enabled": true,
        "type": "prometheus-remote-write",
        "url": "https://<PROMETHEUS_IP_
ADDRESS>:9090/api/v1/write"
      }
    ]
  }
}
```

To work with multiple Export Targets over HTTPS (this example shows two):

```
{
  "enabled": true,
  "export-targets": {
    "add": [
      {
        "server-auth": {
          "sigv4auth": {
            "region": "<Region>",
            "aws-access-key-id": "<Access Key
ID>",
            "aws-secret-access-key": "<Access
Key>",
            "session-token": "<Session Token>"
          }
        },
        "enabled": true,
        "type": "prometheus-remote-write-1",
        "url": "https://<PROMETHEUS_IP_ADDRESS_
#1>:9090/api/v1/write",
        "name": "My-Prometheus-Target-1"
      },
      {
        "enabled": true,
        "type": "prometheus-remote-write-2",
        "url": "https://<PROMETHEUS_IP_ADDRESS_
#2>:9090/api/v1/write",
        "name": "My-Prometheus-Target-2"
      }
    ]
  }
}
```

To work with multiple Export Targets over HTTPS and over HTTP (this example shows two):

```
{
  "enabled": true,
  "export-targets": {
    "add": [
      {
        "server-auth": {
          "sigv4auth": {
            "region": "<Region>",
            "aws-access-key-id": "<Access Key
ID>",
            "aws-secret-access-key": "<Access
Key>",
            "session-token": "<Session Token>",
            "enabled": true,
            "type": "prometheus-remote-write-1",
            "url": "https://<PROMETHEUS_IP_
ADDRESS_#1>:9090/api/v1/write",
            "name": "My-Prometheus-Target-1"
          }
        }
      },
      {
        "enabled": true,
        "type": "prometheus-remote-write-2",
        "url": "http://<PROMETHEUS_IP_ADDRESS_
#2>:9090/api/v1/write",
        "name": "My-Prometheus-Target-2"
      }
    ]
  }
}
```

2. Run the configuration command to apply the payload - either the CLI command (in the Expert mode), or the Gaia REST API command:

- Method 1 - Run the CLI command "sklnctl":

- a. Save the JSON payload in a file (for example, /home/admin/payload\_AWS.json).
- b. On a Scalable Platform Security Group, copy the JSON payload file to all Security Group Members:

```
asg_cp2blades /home/admin/payload_AWS.json
```

- c. Run this command:

- On a Security Gateway / each Cluster Member / Management Server / Log Server / SmartEvent Server:

```
sklnctl export --set "$(cat /home/admin/payload_AWS.json) "
```

- On a Scalable Platform Security Group:

```
g_all sklnctl export --set "$(cat /home/admin/payload_AWS.json) "
```

- Method 2 - Run the Gaia REST API command "set-open-telemetry" (requires Gaia API v1.7 and higher):

```
POST{server}/v1.7/set-open-telemetry
Content-Type: application/json
X-chkp-sid: {{session}}
{
  <JSON AWS Payload>
}
```

# Step 5 - Configure the filter for the OpenTelemetry Collector exported metrics

## Procedure

The `sklnctl` tool configures the OpenTelemetry Collector.

The OpenTelemetry Collector filter works on the allow-list basis.

**Note** - On a Scalable Platform Security Group, run the "`g_all sklnctl <options>`" command.

These are the available commands (in the Expert mode):

- To show the currently exported metrics:

```
sklnctl otelcol metrics --show
```

- To check if default metrics are exported:

```
sklnctl otelcol metrics --is-default
```

- To add metrics to the allow-list:

```
sklnctl otelcol metrics --add <metric-id1> <metric-id2>  
<metric-id3> ...
```

- To remove metrics from the allow-list:

```
sklnctl otelcol metrics --remove <metric-id1> <metric-id2>  
<metric-id3> ...
```

- To reset the allow-list to the default:

```
sklnctl otelcol metrics --reset
```

**Example workflow (in the Expert mode):**

1. Show the currently exported metrics:

```
sklnctl otelcol metrics --show > /var/log/metrics.txt
```

2. Edit the file to keep only the desired metrics:

```
vi /var/log/metrics.txt
```

See "[Skyline Metrics Repository](#)" on page 64.

3. On a Scalable Platform Security Group, copy the file to all Security Group Members:

```
asg_cp2blades /var/log/metrics.txt
```

4. Add the desired metrics to the allow-list:

- On a Security Gateway / each Cluster Member / Management Server / Log Server / SmartEvent Server:

```
sklnctl otelcol metrics --add $(cat  
/var/log/metrics.txt | tr '\n' ' ')
```

- On a Scalable Platform Security Group:

```
g_all sklnctl otelcol metrics --add $(cat  
/var/log/metrics.txt | tr '\n' ' ')
```

## Step 6 - Configure Access Control Policy

If you configured Skyline on a Security Gateway, ClusterXL, or Scalable Platform Security Group, then you must make sure your Access Control Policy allows the connection to the Prometheus Server to send the exported metrics.

You must configure the required rule on the Management Server (in SmartConsole or with Management API) and install the policy.

See the:

- [Quantum Security Management Administration Guide](#) for your version.
- [Check Point Management API Reference](#).

# Skyline Configuration on Check Point Servers that run Gaia OS - Other Monitoring Tools

- ★ **Best Practice** - Use the Prometheus Server with the Grafana Server.  
See "[Skyline Configuration on Check Point Servers that run Gaia OS - Prometheus with Grafana](#)" on page 17.

Skyline supports other third-party monitoring tools (to configure these tools, refer to the third-party official documentation):

- [Splunk](#)
- [SolarWinds](#)
- [Dynatrace](#)
- [VictoriaMetrics](#)
- [Datadog](#)

This section applies to these Check Point Servers:

- Security Gateways / VSX Gateways.
- ClusterXL Members.  
In a Cluster, you must configure all the Cluster Members in the same way.
- Security Groups on Scalable Platforms (ElasticXL Cluster, Maestro, and Scalable Chassis).
- Security Management Servers.
- Multi-Domain Security Management Servers.
- Multi-Domain Log Servers.
- Log Servers.
- SmartEvent Servers.
- Endpoint Security Management Servers.
- Endpoint Policy Servers.

## Step 1 - Install the Third-Party Monitoring Tool

Refer to the third-party official documentation.

## Step 2 - Install the OpenTelemetry Agent and OpenTelemetry Collector on the Check Point Server

### Procedure

#### On an online Check Point Server:

The OpenTelemetry Agent (`OtlpAgent`) and the OpenTelemetry Collector (`CPotelcol`) packages are installed automatically on all applicable Check Point Servers, if you allowed the Automatic Update downloads as described in [sk94508](#).

#### On an offline Check Point Server:

The minimum required OpenTelemetry Agent and OpenTelemetry Collector packages are also installed as part of the Jumbo Hotfix Accumulator installation.

See [sk178566](#) > section "Requirements".

#### Related offline update packages:

- [sk181615 - OpenTelemetry Agent \(OtlpAgent\) Release Updates](#)
- [sk180522 - OpenTelemetry Collector \(CPotelcol\) Release Updates](#)
- [sk180521 - OpenTelemetry CPviewExporter Release Updates](#)

# Step 3 - Configure the OpenTelemetry Collector on the Check Point Server to work with the Third-Party Monitoring Tool

## Important Notes

### Important:

- Do not cut and paste the commands below. Enter them manually.
- In a Cluster, you must configure all the Cluster Members in the same way.
- In Management High Availability, we recommend to configure all the Management Servers in the same way.
- On a Maestro Orchestrator (MHO):  
You can run the CLI command "sklnctl" (in the Expert mode) or run the Gaia REST API command (requires Gaia API v1.7 or higher).  
The CLI command runs on the Orchestrator and configures only the Orchestrator.
- In a Scalable Platform Security Group:  
You can run the CLI command "g\_all sklnctl" (in the Expert mode) or run the Gaia REST API command (requires Gaia API v1.7 or higher).
- For the applicable Gaia REST API commands, refer to the [Check Point Gaia API Reference](#) (v1.7 and higher):
  - In Gaia API v1.8 and higher: Section "*Diagnostics*" > Section "*OpenTelemetry*".
  - In Gaia API v1.7: Section "*OpenTelemetry*".

## Procedure

1. Prepare the required payload for the command:

 **Notes:**

- Replace the placeholder strings "< . . . >" below with your actual strings.
- The "name" attribute is optional, but recommended.  
Must contain only lowercase Latin letters (a-z).
- To configure a TLS connection between the OpenTelemetry Collector and monitoring server:

In the "ca-public-key" section, configure the TLS settings with the CA certificate of your monitoring server (as PEM X509), or use a self-signed certificate you generate for yourself.

In the example payloads below, replace "<SERVER-CERTIFICATE>" with the CA certificate of the monitoring server (PEX X509) - paste the entire string:

```
-----BEGIN CERTIFICATE-----<BASE64_TEXT>-----END
CERTIFICATE-----
```

- In the "url" attribute, configure your monitoring server's IP address / URL.  
If you do not wish to use TLS encryption in labs or test environments, then make these changes in the payload:
  - a. In the "url" attribute, change the URL protocol from "https://" to "http://".
  - b. Remove the "client-auth" and "server-auth" attributes.  
**Note** - When you apply the payload, this warning appears: "it is recommended to have both client and server authentication").

## Example JSON payloads for Splunk:

 **Note** - For information about a HEC Token for Splunk, [click here](#).

### JSON payload for Splunk - connection with TLS

```

{
  "enabled": true,
  "export-targets": {
    "add": [
      {
        "client-auth": {
          "token": {
            "custom-header": {
              "key": "token",
              "value": "<YOUR_HEC_TOKEN>"
            }
          }
        },
        "server-auth": {
          "ca-public-key": {
            "type": "PEM-X509",
            "value": "<SERVER-CERTIFICATE>"
          }
        },
        "enabled": true,
        "type": "splunk_hec",
        "name": "splunk-tls-01",
        "url": "https://<FQDN_or_IP_of_SPLUNK_SERVER>:8088/services/collector/event"
      }
    ]
  }
}

```

### JSON payload for Splunk - connection without TLS

```

{
  "enabled": true,
  "export-targets": {
    "add": [
      {
        "client-auth": {
          "token": {
            "custom-header": {
              "key": "token",
              "value": "<YOUR_HEC_TOKEN>"
            }
          }
        },
        "enabled": true,
        "type": "splunk_hec",
        "name": "splunk-no-tls-01",
        "url": "https://<FQDN_or_IP_of_SPLUNK_SERVER>:8088/services/collector/event"
      }
    ]
  }
}

```

**Example JSON payloads for SolarWinds:**

 **Note** - For information about an API Token for SolarWinds, [click here](#).

**JSON payload for SolarWinds - connection with TLS**

```
{
  "enabled": true,
  "export-targets": {
    "add": [
      {
        "client-auth": {
          "token": {
            "custom-header": {
              "key": "Authorization",
              "value": "Bearer <YOUR_API_TOKEN>"
            }
          }
        },
        "server-auth": {
          "ca-public-key": {
            "type": "PEM-X509",
            "value": "<SERVER-CERTIFICATE>"
          }
        },
        "enabled": true,
        "type": "otlp",
        "name": "solarwinds-tls-01",
        "url": "otel.collector.<YOUR_REGION>.cloud.solarwinds.com:443"
      }
    ]
  }
}
```

**JSON payload for SolarWinds - connection without TLS**

```
{
  "enabled": true,
  "export-targets": {
    "add": [
      {
        "client-auth": {
          "token": {
            "custom-header": {
              "key": "Authorization",
              "value": "Bearer <YOUR_API_TOKEN>"
            }
          }
        },
        "enabled": true,
        "type": "otlp",
        "name": "solarwinds-no-tls-01",
        "url": "otel.collector.<YOUR_REGION>.cloud.solarwinds.com:443"
      }
    ]
  }
}
```

**Example JSON payloads for Dynatrace:**

 **Note** - For information about a Access Token for Dynatrace, [click here](#).

**JSON payload for Dynatrace - connection with TLS**

```
{
  "enabled": true,
  "export-targets": {
    "add": [
      {
        "client-auth": {
          "token": {
            "custom-header": {
              "key": "Authorization",
              "value": "Api-Token <YOUR_ACCESS_TOKEN>"
            }
          }
        },
        "server-auth": {
          "ca-public-key": {
            "type": "PEM-X509",
            "value": "<SERVER-CERTIFICATE>"
          }
        },
        "enabled": true,
        "type": "otlphttp",
        "name": "dynatrace-tls-01",
        "url": "https://<FQDN_or_IP_of_DYNATRACE_SERVER>.live.dynatrace.com/api/v2/otlp"
      }
    ]
  }
}
```

**JSON payload for Dynatrace - connection without TLS**

```
{
  "enabled": true,
  "export-targets": {
    "add": [
      {
        "client-auth": {
          "token": {
            "custom-header": {
              "key": "Authorization",
              "value": "Api-Token <YOUR_ACCESS_TOKEN>"
            }
          }
        },
        "enabled": true,
        "type": "otlphttp",
        "name": "dynatrace-no-tls-01",
        "url": "https://<FQDN_or_IP_of_DYNATRACE_SERVER>.live.dynatrace.com/api/v2/otlp"
      }
    ]
  }
}
```

**Example JSON payloads for VictoriaMetrics:****JSON payload for VictoriaMetrics - connection with TLS**

**Note** - In the "basic" section, configure the "username" and "password" attributes to your monitoring server's username / password.

The "password" attribute supports only these characters:

- uppercase letters (A-Z)
- lowercase letters (a-z)
- digits (0-9)
- underscore (\_)
- comma (,)
- period (.)
- backslash (\)
- slash (/)
- hyphen (-)

```
{
  "enabled": true,
  "export-targets": {
    "add": [
      {
        "client-auth": {
          "basic": {
            "username": "<USERNAME_on_VICTORIAMETRICS_SERVER>",
            "password": "<PASSWORD_on_VICTORIAMETRICS_SERVER>"
          }
        },
        "enabled": true,
        "server-auth": {
          "ca-public-key": {
            "type": "PEM-X509",
            "value": "<SERVER-CERTIFICATE>"
          }
        },
        "type": "prometheus-remote-write",
        "url": "https://<EXTERNAL_IP_ADDRESS_of_VICTORIAMETRICS_SERVER>:9090/api/v1/write"
      }
    ]
  }
}
```

**JSON payload for VictoriaMetrics - connection without TLS**

```
{
  "enabled": true,
  "export-targets": {
    "add": [
      {
        "enabled": true,
        "type": "prometheusremotewrite",
        "url": "https://<EXTERNAL_IP_ADDRESS_of_VICTORIAMETRICS_SERVER>:8088/services/collector"
      }
    ]
  }
}
```

## Example JSON payloads for Datadog:

**!** **Warning** - Skyline does **not** support a JSON payload that contains other export targets together with the Datadog export target.

### JSON payload for Datadog - connection with TLS

```
{
  "enabled": true,
  "export-targets": {
    "add": [
      {
        "client-auth": {
          "token": {
            "custom-header": {
              "key": "apikey",
              "value": "<YOUR-API-KEY>"
            }
          }
        },
        "server-auth": {
          "ca-public-key": {
            "type": "PEM-X509",
            "value": "<SERVER-CERTIFICATE>"
          }
        },
        "enabled": true,
        "type": "datadog",
        "name": "datadog-tls-01",
        "url": "https://<URL_of_YOUR_DATADOG_INSTANCE>"
      }
    ]
  }
}
```

### JSON payload for Datadog - connection without TLS

```
{
  "enabled": true,
  "export-targets": {
    "add": [
      {
        "client-auth": {
          "token": {
            "custom-header": {
              "key": "apikey",
              "value": "<YOUR-API-KEY>"
            }
          }
        },
        "enabled": true,
        "type": "datadog",
        "name": "datadog-no-tls-01",
        "url": "https://<URL_of_YOUR_DATADOG_INSTANCE>"
      }
    ]
  }
}
```

2. Run the configuration command to apply the JSON payload - either the CLI command (in the Expert mode), or the Gaia REST API command:

- **Method 1 - Run the CLI command "sklnctl":**

- a. Save the JSON payload in a file (for example, /home/admin/payload.json).
- b. On a Scalable Platform Security Group, copy the JSON payload file to all Security Group Members:

```
asg_cp2blades /home/admin/payload.json
```

- c. Run this command:

- On a Security Gateway / each Cluster Member / Management Server / Log Server / SmartEvent Server:

```
sklnctl export --set "$(cat /home/admin/payload.json) "
```

- On a Scalable Platform Security Group:

```
g_all sklnctl export --set "$(cat /home/admin/payload.json) "
```

- **Method 2 - Run the Gaia REST API command "set-open-telemetry" (requires Gaia API v1.7 and higher):**

```
POST{server}/v1.7/set-open-telemetry
Content-Type: application/json
X-chkp-sid: {{session}}
{
  <JSON Payload>
}
```

 **Note** - To disable Skyline completely:

- a. Change the value of the "enabled" attribute in the JSON payload file:
  - from "enabled": true
  - to "enabled": false
- b. Run the API command again

## Step 4 - Configure the filter for the OpenTelemetry Collector exported metrics

### Procedure

The `sklnctl` tool configures the OpenTelemetry Collector.

The OpenTelemetry Collector filter works on the allow-list basis.

**Note** - On a Scalable Platform Security Group, run the "`g_all sklnctl <options>`" command.

These are the available commands (in the Expert mode):

- To show the currently exported metrics:

```
sklnctl otelcol metrics --show
```

- To check if default metrics are exported:

```
sklnctl otelcol metrics --is-default
```

- To add metrics to the allow-list:

```
sklnctl otelcol metrics --add <metric-id1> <metric-id2>  
<metric-id3> ...
```

- To remove metrics from the allow-list:

```
sklnctl otelcol metrics --remove <metric-id1> <metric-id2>  
<metric-id3> ...
```

- To reset the allow-list to the default:

```
sklnctl otelcol metrics --reset
```

**Example workflow (in the Expert mode):**

1. Show the currently exported metrics:

```
sklnctl otelcol metrics --show > /var/log/metrics.txt
```

2. Edit the file to keep only the desired metrics:

```
vi /var/log/metrics.txt
```

See "[Skyline Metrics Repository](#)" on page 64.

3. On a Scalable Platform Security Group, copy the file to all Security Group Members:

```
asg_cp2blades /var/log/metrics.txt
```

4. Add the desired metrics to the allow-list:

- On a Security Gateway / each Cluster Member / Management Server / Log Server / SmartEvent Server:

```
sklnctl otelcol metrics --add $(cat  
/var/log/metrics.txt | tr '\n' ' ')
```

- On a Scalable Platform Security Group:

```
g_all sklnctl otelcol metrics --add $(cat  
/var/log/metrics.txt | tr '\n' ' ')
```

## Step 5 - Configure Access Control Policy

If you configured Skyline on a Security Gateway, ClusterXL, or Scalable Platform Security Group, then you must make sure your Access Control Policy allows the connection to the Third-Party Monitoring Tool to send the exported metrics.

You must configure the required rule on the Management Server (in SmartConsole or with Management API) and install the policy.

See the:

- [Quantum Security Management Administration Guide](#) for your version.
- [Check Point Management API Reference](#).

# Skyline Configuration on Quantum Spark Appliances

## Video Tutorial

<https://www.youtube.com/watch?v=FO2Rp9x31i0>

## Step 1 - Install the Prometheus Server

**Note** - Skip this step if you have already installed the Prometheus Server

### Procedure

#### Installing a Prometheus Server

To install a Prometheus Server on the external server, refer to [the Prometheus installation instructions](#) for the various platforms.

#### Prometheus Server Default URL

```
http://localhost:9090
```

#### Configuring a Prometheus Server

1. **Mandatory:** On the Prometheus Server, enable its Remote Write Receiver to get metrics data from the Check Point Servers. Refer to [these Prometheus instructions](#).
2. **Optional:** Use TLS Encryption and Basic authentication to secure the connection between the Prometheus Server and the OpenTelemetry Collector.

#### Instructions

The Prometheus Server and OpenTelemetry Collector support Transport Layer Security (TLS) encryption for their connection. Refer to [these Prometheus instructions](#).

Check Point also requires you to enable basic authentication to make the security bi-directional, refer to [these Prometheus instructions](#).

TLS configuration has two main components:

- A pair of a Key and a Certificate, used to encrypt your communication.
- (Optional) Certificate Authority (CA) that you trust, used to verify and trust the certificate of the other endpoint with which you communicate. If the certificate of the other endpoint is unknown to the CA, the communication is rejected.

You can create these certificates:

- CA-signed certificates: You create a key and a certificate request, which is then signed by the CA.
- Self-signed certificates: You create a key and a certificate that is signed by the user.

The steps below describe a self-signed certificate.

To configure TLS, you must create two pairs of a key and a certificate on the Prometheus Server:

- a. Create a self-signed certificate and a private key on the Prometheus Server:
  - i. Create the file called `openssl.conf` with the template below.

Enter the applicable information in the "[ `dn` ]" and "[ `alt_names` ]" sections.

-  **Important** - The Prometheus Server and the OpenTelemetry Collector must have different hostnames and IP addresses.

**Template:**

```

[ req ]
default_bits      = 4096
default_md        = sha256
req_extensions    = v3_req
distinguished_name = dn
prompt = no

[ v3_req ]
subjectAltName = @alt_names

[ dn ]
C = <Country Name>
ST = <State Or Province Name>
L = <Locality>
O = <Organization>
OU = <Organization Unit>
CN = <Common Name>

[ alt_names ]
DNS = <HOSTNAME>
IP = <IP ADDRESS>

```

- ii. Generate the key and certificate pair on any Gaia OS server (in the Expert mode):

```

copenssl req -x509 -newkey rsa:4096 -nodes -
config openssl.conf -keyout mykey.key -out
mycert.crt -extensions v3_req

```

This command creates two files in the current working directory:

- mykey.key
- mycert.crt

Move these two files from the Gaia OS server to the Prometheus Server.

- b. Use the newly generated key and certificate file to configure TLS on the Prometheus Server in the `web-config.yaml` configuration file (**you may need to create this file**).

Example of a `web-config.yaml` file:

```
tls_server_config:  
  key_file: /home/admin/mykey.key  
  cert_file: /home/admin/mycert.crt
```

## Step 2 - Install the Grafana Server

 **Note** - Skip this step if you have already installed the Grafana Server.

### Procedure

#### Installing a Grafana Server

To install a Grafana Server on the external server, refer to [the Grafana installation instructions](#).

 **Note** - You can install the Grafana Server on the same server that contains your Prometheus Server instance.

#### Grafana Server Default URL

```
http://localhost:3000
```

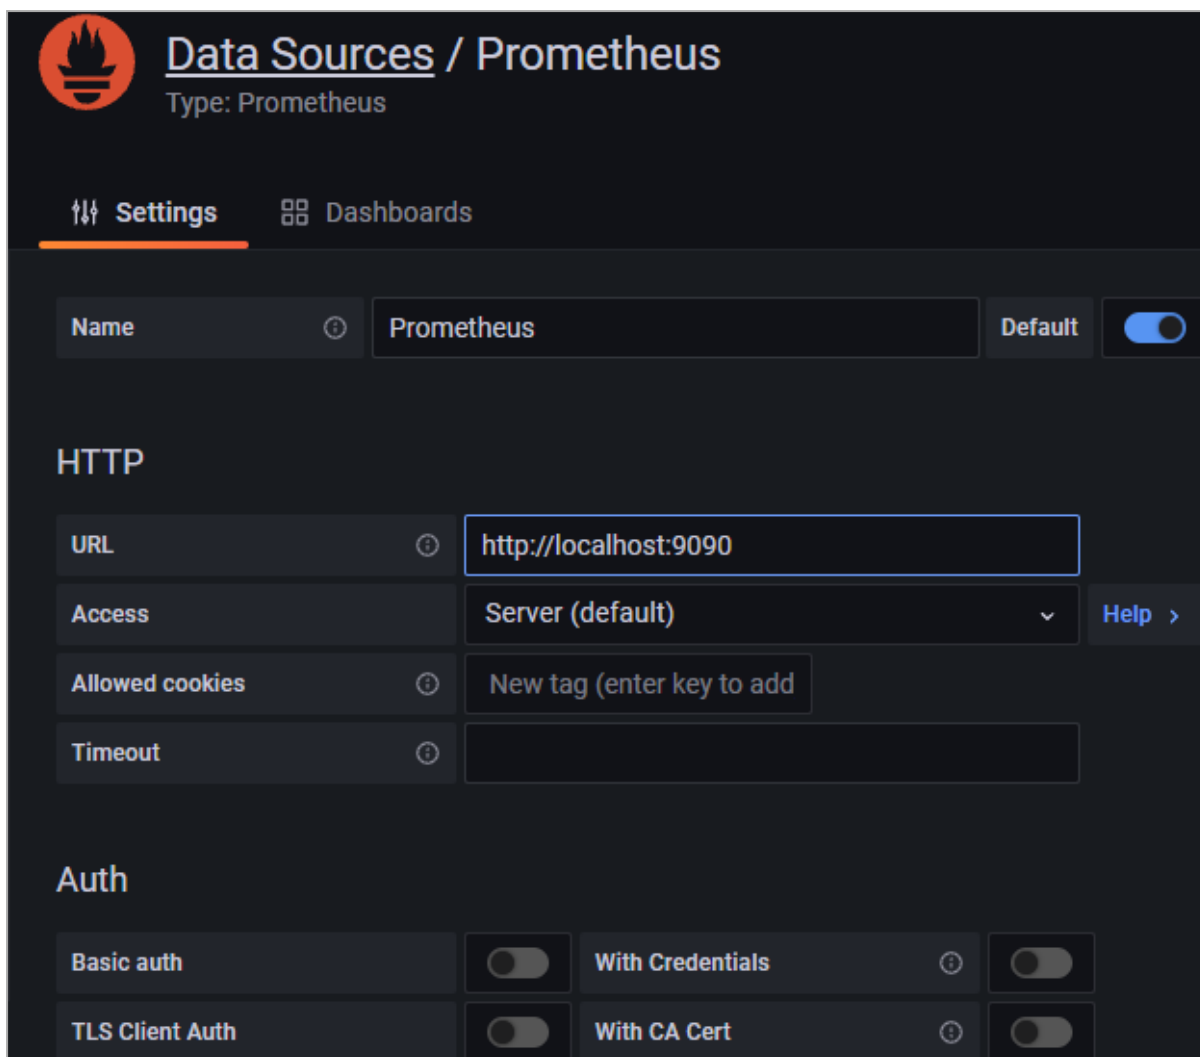

#### Configuring a Grafana Server (connecting Data-source and Dashboards)

1. Log in to Grafana and add a new Prometheus Data Source with the Prometheus Server you created.

On the side panel, click **Configuration > Data sources** > click the **Add data source** button > select the **Prometheus** data source.

Make sure to mark the Prometheus data source as **Default**.

Example:

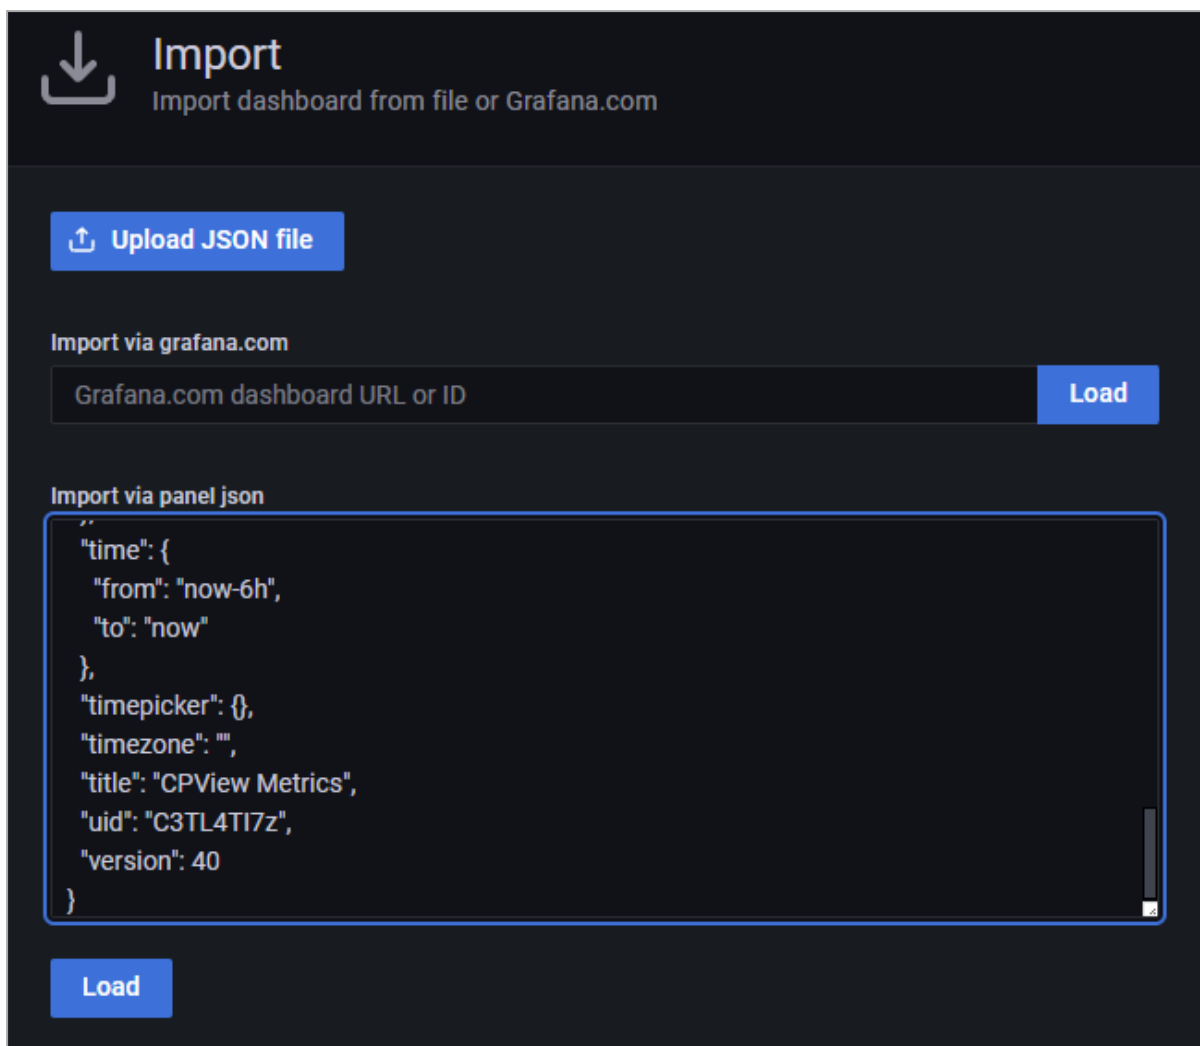

The screenshot shows the Prometheus configuration page in the Skyline interface. The page title is "Data Sources / Prometheus" with a subtitle "Type: Prometheus". The navigation menu includes "Settings" (active) and "Dashboards". The main configuration area is divided into sections: "Name" (Prometheus, Default, and a toggle switch), "HTTP" (URL: http://localhost:9090, Access: Server (default), Allowed cookies: New tag (enter key to add), and Timeout), and "Auth" (Basic auth and TLS Client Auth, each with a toggle switch and a "With Credentials" or "With CA Cert" option).

2. Import the Check Point Grafana dashboard to start monitoring your environment.

On the side panel, click **Create** > **Import** > upload the applicable JSON file for a dashboard.

Example:

3. You can modify the existing dashboards or create new dashboards according to your needs.

To see a full description of all the data exposed by Skyline, see ["Skyline Metrics Repository" on page 64](#).

Example:

# Step 3 - Install the OpenTelemetry Agent and OpenTelemetry Collector on the Quantum Spark Appliance

## Procedure

The Quantum Spark Appliance must be connected to the Internet.

If the Quantum Spark Appliance is connected to the Internet and you enable the Skyline feature, then:

- The appliance automatically downloads the OpenTelemetry Agent (`OtlpAgent`) and the OpenTelemetry Collector (`CPotelcol`) packages.
- The appliance automatically downloads the latest version of the OpenTelemetry Agent package each night.

# Step 4 - Configure OpenTelemetry Collector on the Quantum Spark Appliance to work with the Prometheus Server

You can configure the required settings in WebUI or in Gaia Clish.

## Procedure in WebUI

1. From the left navigation panel, click **Logs & Monitoring**.
2. In the **Diagnostics** section, click the **OpenTelemetry** page.
3. Select **Monitor this appliance using OpenTelemetry**.
4. In the **URL** field, enter the full path of the receiver endpoint on your monitoring server.

Example:

```
https://192.168.33.44:9090/api/v1/write
```

5. **Optional:** In the **Client Authentication** section, enter the username and password to connect to your monitoring server.
6. **Optional:** In the **Server Authentication** section, upload the CA certificate of your monitoring server:
  - a. Click **Upload**.
  - b. Click **Browse**.
  - c. Select the certificate file and click **Open**.
  - d. Click **Preview CA details** to examine the certificate and click **Close**.
  - e. Click **Save**.
7. **Optional:** Click **Test Connection** to make sure the correct server and credentials were entered.
8. In the bottom right corner of this page, click **Save**.

## Procedure in Gaia Clish

### Syntax:

```
set open-telemetry
    cert-base64-encoding "<Base64-Certificate-String>"
    is-active {on | off}
    password <Password>
    url <Full URL>
    username <Username>

show open-telemetry
```

### Syntax Parameters:

Parameter	Description
cert-base64-encoding	<p>The Base64-encoded Certificate String for the CA certificate of your monitoring server.</p> <p>This is the string that appears in a certificate file between the line "BEGIN CERTIFICATE" and the line "END CERTIFICATE" (if you take this string from the file, you need to remove the line breaks).</p> <p>Example:</p> <pre>-----BEGIN CERTIFICATE----- MIICRzCCAbCgAwIBAg ... (truncated) ... H2IZALydA87zbag= -----END CERTIFICATE-----</pre>
is-active	Enables (on) or disables (off) the Skyline OpenTelemetry service.
password	Specifies the password on your monitoring server.
url	<p>Specifies the full path of the receiver endpoint on your monitoring server.</p> <p>Example: <code>https://192.168.33.44:9090/api/v1/write</code></p>
username	Specifies the username on your monitoring server.

**Instructions:****1. Configure the required settings:**

```
set open-telemetry url
"https://192.168.33.44:9090/api/v1/write" username myuser1
password mypassword1 cert-base64-encoding
"MIICRzCCAbCgAwIB... (truncated) ...H2IZALydA87zbag=" is-
active on
```

**2. Examine the configuration:**

```
show open-telemetry
```

## Step 5 - Configure Access Policy

You must make sure your Access Policy allows the connection from the Quantum Spark Appliance to the Prometheus Server to send the exported metrics.

### On a Locally Managed Quantum Spark Appliance:

You must configure the required settings in WebUI or in Gaia Clish.

See the:

- [R81.10.X Quantum Spark Locally Managed Administration Guide for 1500, 1600, 1800, 1900, 2000 Appliances.](#)
- [R81.10.X Quantum Spark CLI Reference Guide for 1500, 1600, 1800, 1900, 2000 Appliances.](#)

### On a Centrally Managed Quantum Spark Appliance:

You must configure the required rule on the Management Server (in SmartConsole or with Management API) and install the policy.

See the:

- [R81.10.X Quantum Spark Centrally Managed Administration Guide for 1500, 1600, 1800, 1900, 2000 Appliances.](#)
- [Quantum Security Management Administration Guide](#) for your version.
- [Check Point Management API Reference.](#)

# Skyline Metrics Repository

This chapter contains a comprehensive list of all the data available from Skyline - exported from relevant devices using OpenTelemetry protocols.

For each metric, a label representing the context is attached automatically (for example, VS ID in VSX).

To query, filter, and further analyze the trace data, each metric has a <key>:<value> pair known as "Attributes" or "Labels".

This pair represents the metadata of the metric.

Metric data may behave differently with time:

Behavior	Description
Constant	Data is not expected to change in the near future
Slow-Changing	Data might change in very slow intervals (for example, one time during a month)
Fast-Changing	Data is constantly changing
Accumulated	Data is accumulated based on a previous value until a restart

The sections below show:

- Corresponding gauges in the Check Point utility CPView (see [sk101878](#)).
- Summary table with the corresponding metric ID and applicable information about it.

References:

- For the metric convention name, refer to <https://opentelemetry.io/docs/specs/semconv/general/metrics/>.
- For the metric types, refer to <https://uptrace.dev/opentelemetry/metrics.html>.
- For the unit convention, refer to <https://github.com/open-telemetry/semantic-conventions/blob/main/docs/general/metrics.md#instrument-units>.

# System > CPU

## CPView Gauges

1. Run: `cpview`
2. From the top, click **Overview**.

In the section **CPU**, see:

- **Load average.**
  - **Num of CPUs.**
3. From the top, click **CPU > Overview > Host**:
    - In the section **Overview**, see **Avg utilization**.
    - In the section **CPU**, see **Interrupts**.

## CLI

Run these commands in the Expert mode:

```
top
```

```
cat /proc/interrupts
```

## Metric Information

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>system.cpu.interrupts</code>	The number of device interrupts that occurred for this CPU core.	Gauge	{interrupts}	{'type', 'cpu'}	<ul style="list-style-type: none"> <li>■ <code>type</code> The category that describes the behavior of the CPU.</li> <li>■ <code>cpu</code> The ID of the CPU core.</li> </ul>	The same data for VSX Gateways (VS0) and other Virtual Systems.
<code>system.cpu.utilization</code>	The utilization of this CPU core as a percentage of the total utilization.	Gauge	{percent}	{'type', 'cpu', 'state'}	<ul style="list-style-type: none"> <li>■ <code>type</code> The category that describes the behavior of the CPU.</li> <li>■ <code>cpu</code> The ID of the CPU core.</li> <li>■ <code>state</code> Percentage of total time of the CPU code was idle/busy by entity."</li> </ul>	The same data for VSX Gateways (VS0) and other Virtual Systems.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>system.cpu.count</code>	The number of CPU cores.	Gauge	{cpu}			The same data for VSX Gateways (VS0) and other Virtual Systems.

# System > CPU > Top

## CPView Gauges

1. Run: `cpview`
2. From the top, click **CPU > Overview > Host** > refer to the section **CPU**.
3. From the top, click **CPU > Overview > Top-Connections** > click the tabs for CoreXL instances > refer to the section **Top Connections**.

## CLI

- To see the CPU utilization of the CoreXL Firewall instances, run this command in the Expert mode:

```
top
```

- To see the top connections, run this command in the Expert mode (see [sk172229](#)):

```
top_conns --help
```

## Metric Information

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
connection.top.cpu.utilization	<p>CPU utilization of the CoreXL Firewall instance, in %.</p> <p>This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> </ul>	Gauge	{percent}	{'instance', 'protocol', 'connection'}	<ul style="list-style-type: none"> <li>▪ <code>instance</code> The number of the CoreXL Firewall instance.</li> <li>▪ <code>protocol</code> Protocol of the connection.</li> <li>▪ <code>connection</code> IP addresses of the Source and Destination.</li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
connection.top.cpu.wt.utilization	<p>"PPE_WT" CPU utilization of the CoreXL SND instance, in %.</p> <p>For information about "PPE_WT", see <a href="#">Performance Tuning Administration Guide</a> for your version &gt; Chapter "HyperFlow". This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> </ul>	Gauge	{percent}	{'instance', 'protocol', 'connection'}	<ul style="list-style-type: none"> <li>▪ instance The number of the CoreXL SND instance.</li> <li>▪ protocol Protocol of the connection.</li> <li>▪ connection IP addresses of the Source and Destination.</li> </ul>	Different data for each Virtual System.

# System > Memory

## CPView Gauges

1. Run: `cpview`
2. From the top, click **Overview**.
3. In the section **Memory**, see **Physical**.

## CLI

- Run this command in the Expert mode:

```
top
```

- Run this command in Gaia Clish:

```
show system memory status
```

## Metric Information

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>system.memory.limit</code>	The total RAM available for processes, in Bytes.	Gauge	By			The same data for VSX Gateway (VS0) and other Virtual Systems.
<code>system.memory.usage</code>	The RAM usage by processes, in Bytes.	AsyncUpDownCounter	By			The same data for VSX Gateway (VS0) and other Virtual Systems.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>system.fw.memory.limit</code>	<p>The total RAM available for Firewall processes, in Bytes.</p> <p>This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> <li>▪ <a href="#">R81.20 Jumbo Hotfix Accumulator</a>, Take 54 and higher</li> <li>▪ <a href="#">R81.10 Jumbo Hotfix Accumulator</a>, Take 135 and higher</li> <li>▪ <a href="#">R81 Jumbo Hotfix Accumulator</a>, Take 99 and higher</li> </ul>	Gauge	By			The same data for VSX Gateway (VS0) and other Virtual Systems.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
system.fw.memory.usage	<p>The RAM usage by Firewall processes, in Bytes.</p> <p>This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> <li>▪ <a href="#">R81.20 Jumbo Hotfix Accumulator</a>, Take 54 and higher</li> <li>▪ <a href="#">R81.10 Jumbo Hotfix Accumulator</a>, Take 135 and higher</li> <li>▪ <a href="#">R81 Jumbo Hotfix Accumulator</a>, Take 99 and higher</li> </ul>	AsyncUpDownCounter	By	{'state'}	<ul style="list-style-type: none"> <li>▪ state Memory - "free" or "used".</li> </ul>	The same data for VSX Gateway (VS0) and other Virtual Systems.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
system.fw.memory.utilization	<p>The RAM usage by Firewall processes, in %.</p> <p>This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> <li>▪ <a href="#">R81.20 Jumbo Hotfix Accumulator</a>, Take 54 and higher</li> <li>▪ <a href="#">R81.10 Jumbo Hotfix Accumulator</a>, Take 135 and higher</li> <li>▪ <a href="#">R81 Jumbo Hotfix Accumulator</a>, Take 99 and higher</li> </ul>	Gauge	{percent}	{'state'}	<ul style="list-style-type: none"> <li>▪ state Used memory in %.</li> </ul>	The same data for VSX Gateway (VS0) and other Virtual Systems.

# System > Memory Paging

## CPView Gauges

1. Run: `cpview`
2. From the top, click **Overview**.
3. In the section **Memory**, see **Swap**.

## CLI

- Run this command in the Expert mode:

```
top
```

- Run this command in Gaia Clish:

```
show system memory status
```

## Metric Information

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description
<code>system.paging.limit</code>	The total RAM assigned to swap memory, in Bytes.	Gauge	By		

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description
<code>system.paging.usage</code>	The RAM usage for swap, in Bytes.	AsyncUpDownCounter	By	<ul style="list-style-type: none"><li>▪ <code>{'state'}</code> Memory - "free" or "used".</li></ul>	<ul style="list-style-type: none"><li>▪ <code>state</code> The used disk space.</li></ul>

# System > Traffic

## CPView Gauges

1. Run: `cpview`
2. From the top, click **Network > Traffic**:
  - a. See the section **Traffic Rate**.
  - b. See the section **Concurrent Connections**.
  - c. See the section **Drops**.

## CLI

Run these commands in Gaia Clish or in the Expert mode (see the [CLI Reference Guide](#) for your version):

```
cpstat -f policy fw
```

```
fwaccel stats
```

## Metric Information

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
system.traffic.connections	Number of concurrent connections	AsyncUpDownCounter	{connections}	{'component', 'state', 'protocol'}	<ul style="list-style-type: none"> <li>■ component The name of the component: <ul style="list-style-type: none"> <li>• FW</li> <li>• SXL</li> </ul> </li> <li>■ state The current state of the TCP connection: <ul style="list-style-type: none"> <li>• handshake</li> <li>• established</li> <li>• closed</li> </ul> </li> <li>■ protocol The protocol: <ul style="list-style-type: none"> <li>• tcp</li> <li>• other</li> </ul> </li> </ul>	

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
system.traffic.dropped	The total number of traffic drops made by Security Gateway Software Blades	AsyncCounter	{drops}	{'type'}	<ul style="list-style-type: none"> <li>■ type</li> <li>The reason for the drop: <ul style="list-style-type: none"> <li>• General</li> <li>• Rulebase</li> <li>• CoreXL</li> <li>• SXL</li> <li>• Capacity</li> <li>• First Packets Not SYN</li> </ul> </li> </ul>	

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
system.traffic.dropped.rate	<p>The rate of traffic drops (number of drops per second) made by Security Gateway Software Blades</p> <p>This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> <li>▪ <a href="#">R81.20 Jumbo Hotfix Accumulator</a>, Take 70 and higher</li> </ul>	Gauge	{drops}	{'type', 'ppak_instance', 'component'}	<ul style="list-style-type: none"> <li>▪ type <ul style="list-style-type: none"> <li>• The reason for the drop: <ul style="list-style-type: none"> <li>• General</li> <li>• Rulebase</li> <li>• CoreXL</li> <li>• SXL</li> <li>• Capacity</li> <li>• First Packets Not SYN</li> </ul> </li> </ul> </li> <li>▪ ppak_instance <ul style="list-style-type: none"> <li>• The SecureXL instance associated with the dropped rate.</li> </ul> </li> <li>▪ component <ul style="list-style-type: none"> <li>• The name of the component responsible for the drop:</li> </ul> </li> </ul>	

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
	<ul style="list-style-type: none"> <li>▪ <a href="#">R81.10 Jumbo Hotfix Accumulator</a>, Take 152 and higher</li> </ul>				<ul style="list-style-type: none"> <li>• FW</li> <li>• SXL</li> </ul>	
system.traffic.io.receive	Inbound throughput (bits per second)	Gauge	b/s	{component}	<ul style="list-style-type: none"> <li>▪ component The name of the component.</li> </ul>	
system.traffic.io.transmit	Outbound throughput (bits per second)	Gauge	b/s	{component}	<ul style="list-style-type: none"> <li>▪ component The name of the component</li> </ul>	
system.traffic.packets.receive	Inbound packet rate (packets per second)	Gauge	packets/s	{component}	<ul style="list-style-type: none"> <li>▪ component The name of the component</li> </ul>	

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>system.traffic.packets.transmit</code>	Outbound packet rate (packets per second)	Gauge	packets/second	{component}	<ul style="list-style-type: none"><li>component The name of the component</li></ul>	

# System > Network

## CPView Gauges

1. Run: `cpview`
2. From the top, click **Network > Traffic**:
  - a. See the section **Traffic Rate**.
  - b. See the section **Concurrent Connections**.
  - c. See the section **Drops**.

## CLI

Run these commands in Gaia Clish or in the Expert mode (see the [CLI Reference Guide](#) for your version):

```
cpstat -f policy fw
```

```
fwaccel stats
```

## Metric Information

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>system.network.connections</code>	The number of concurrent connections.	AsyncUpDownCounter	{connections}/s	{component}	<ul style="list-style-type: none"> <li>component The name of the component.</li> </ul>	Different data for each Virtual System.
<code>system.network.connections.rate</code>	Connection rate (connections per second).	Gauge	{connections}/s	{component}	<ul style="list-style-type: none"> <li>component The name of the component.</li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>system.network.tcp_out_of_state_drops.state</code>	<p>The state of the global setting "TCP - Drop Out of State":</p> <ul style="list-style-type: none"><li>▪ 0 - disabled</li><li>▪ 1 - enabled</li></ul>	Gauge	{state}			

# System > Network > Interfaces

## CPView Gauges

1. Run: `cpview`
2. From the top, click **Network > Interfaces**:
  - a. Click **Overview**.
  - b. Click **Traffic**.

## CLI

- To see the configuration of interfaces and their traffic statistics, run these commands in Gaia Clish:

```
show interfaces all
```

```
show interface <Name of Interface>
```

- To see the interface driver / firmware, run this command in the Expert mode:

```
show interface <Name of Interface> driver-information
```

- To see the interface driver / firmware, run this command in the Expert mode:

```
ethtool -i <Name of Interface>
```

## Metric Information

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
system.network.interface.state	<p>The state of the network interface:</p> <ul style="list-style-type: none"> <li>▪ 0 - off</li> <li>▪ 1 - on</li> </ul>	Gauge	{state}	{'speed', 'type', 'driver', 'name', 'device', 'port'}	<ul style="list-style-type: none"> <li>▪ speed The current speed of the network interface.</li> <li>▪ type The type of the network interface (for example, "ethernet", "loopback").</li> <li>▪ driver</li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
					<p>The driver name used by this network interface.</p> <ul style="list-style-type: none"><li>■ name The name of the network interface as assigned by the operating system.</li><li>■ device</li></ul>	

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
					<p>The name of the network interface device in the operating system.</p> <ul style="list-style-type: none"><li>port</li></ul> <p>The type of port used by this network interface (for example, "TP", "N/A").</p>	

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
system.network.interface.address	The IP address of the network interface.	Gauge	{address}	{'address', 'protocol'}	<ul style="list-style-type: none"> <li>■ address The name of the network interface device in the operating system.</li> <li>■ protocol The IP version (IPv4 or IPv6).</li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
system.network.interface.io.receive.rate	The current rate of successfully received packets over the communication channel (in bits per second).	Gauge	b/s	{'device', 'interface'}	<ul style="list-style-type: none"> <li>■ device The name of the network interface device in the operating system.</li> <li>■ interface The name of the network interface as assigned by the operating system.</li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
system.network.interface.io.receive.rate.peak	The maximal recorded rate of successfully received packets for this network interface (in bits per second).	Gauge	b/s	{'device', 'interface'}	<ul style="list-style-type: none"> <li>▪ device The name of the network interface device in the operating system.</li> <li>▪ interface The name of the network interface as assigned by the operating system.</li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
system.network.interface.packets.receive.rate.peak	The maximal recorded rate of successfully received packets for this network interface (in packets per second)	Gauge	packets/sec	{'device', 'interface'}	<ul style="list-style-type: none"> <li>■ device The name of the network interface device in the operating system.</li> <li>■ interface The name of the network interface as assigned by the operating system.</li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
system.network.interface.packets.receive.rate	The current rate of successfully received packets over the communication channel (in packets per second).	Gauge	packets/sec	{'device', 'interface'}	<ul style="list-style-type: none"> <li>▪ device The name of the network interface device in the operating system.</li> <li>▪ interface The name of the network interface as assigned by the operating system.</li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
system.network.interface.io.transmit.rate	The current rate of successfully transmitted packets over the communication channel (in bits per second).	Gauge	b/s	{'device', 'interface'}	<ul style="list-style-type: none"> <li>■ device The name of the network interface device in the operating system.</li> <li>■ interface The name of the network interface as assigned by the operating system.</li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
system.network.interface.io.transmit.rate.peak	The maximal recorded rate of successfully transmitted packets for this network interface (in bits per second).	Gauge	b/s	{'device', 'interface'}	<ul style="list-style-type: none"> <li>▪ device The name of the network interface device in the operating system.</li> <li>▪ interface The name of the network interface as assigned by the operating system.</li> </ul>	Different data for each Virtual System.

# System > Network > Packets

## CPView Gauges

1. Run: `cpview`
2. From the top, click **Network > Interfaces > Traffic**.  
See the sections:
  - **RX Traffic.**
  - **TX Traffic.**
  - **Errors and Drops.**
3. From the top, click **Advanced > Network > Overview**.  
See the section **General Statistics**.

## CLI

See the [Gaia Administration Guide](#) for your version.

- To see the traffic statistics for interfaces, run these commands in Gaia Clish:

```
show interfaces all
```

```
show interface <Name of Interface>
```

- To see the interface driver / firmware, run this command in the Expert mode:

```
show interface <Name of Interface> driver-information
```

- To see the interface driver / firmware, run this command in the Expert mode:

```
ethtool -i <Name of Interface>
```

## Metric Information

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>system.network.packets.receive</code>	The total number of received packets by this network interface since the boot.	AsyncCounter	{packets}	{'device', 'interface'}	<ul style="list-style-type: none"> <li>■ <code>device</code> The name of the network interface device in the operating system.</li> <li>■ <code>interface</code> The name of the network interface as assigned by the operating system.</li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>system.network.dropped.receive</code>	The total number of the received packets that were dropped since boot.	AsyncCounter	{packets}	{'device', 'interface'}	<ul style="list-style-type: none"> <li>■ <code>device</code> The name of the network interface device in the operating system.</li> <li>■ <code>interface</code> The name of the network interface as assigned by the operating system.</li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>system.network.errors.receive</code>	The total number of corrupted received packets since the boot.	AsyncCounter	{errors}	{'device', 'interface'}	<ul style="list-style-type: none"> <li>■ <code>device</code> The name of the network interface device in the operating system.</li> <li>■ <code>interface</code> The name of the network interface as assigned by the operating system.</li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>system.network.io.receive</code>	The total number of received traffic bits by the network interface since the boot.	AsyncCounter	b	{'device', 'interface'}	<ul style="list-style-type: none"> <li>■ <code>device</code> The name of the network interface device in the operating system.</li> <li>■ <code>interface</code> The name of the network interface as assigned by the operating system.</li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>system.network.packets.transmitted</code>	The total number of transmitted packets by this network interface since the boot.	AsyncCounter	{packets}	{'device', 'interface'}	<ul style="list-style-type: none"> <li>■ <code>device</code> The name of the network interface device in the operating system.</li> <li>■ <code>interface</code> The name of the network interface as assigned by the operating system.</li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>system.network.io.transmit</code>	The total number of transmitted traffic bits by the network interface since the boot.	AsyncCounter	b	{'device', 'interface'}	<ul style="list-style-type: none"> <li>■ <code>device</code> The name of the network interface device in the operating system.</li> <li>■ <code>interface</code> The name of the network interface as assigned by the operating system.</li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>system.network.dropped.transmitted</code>	The total number of dropped transmitted packets since the boot.	AsyncCounter	{packets}	{'device', 'interface'}	<ul style="list-style-type: none"> <li>■ <code>device</code> The name of the network interface device in the operating system.</li> <li>■ <code>interface</code> The name of the network interface as assigned by the operating system.</li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>system.network.errors.transmit</code>	The total number of corrupted transmitted packets since the boot. # System > Network > NAT

## CPView Gauges

1. Run: `cpview`
2. From the top, click **Advanced > NAT**:
  - a. Click **Pool-IPv4**.
  - b. Click **Pool-IPv6**.

## CLI

Run this command in the Expert mode (see the [CLI Reference Guide](#) for your version):

```
fw ctl pstat -m
```

## Metric Information

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>system.network.nat.connections.count</code>	The number of NAT pool concurrent connections.	AsyncUpDownCounter	{connections}	{'protocol'}	<ul style="list-style-type: none"> <li>protocol Which protocol is used.</li> </ul>	Different data for each Virtual System.
<code>system.network.nat.connections.rate</code>	The number of NAT pool concurrent connections per second.	AsyncUpDownCounter	{connections}/s	{'protocol'}	<ul style="list-style-type: none"> <li>protocol Which protocol is used.</li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
system.network.nat.ports	The number of ports used for the NAT pool.	AsyncCounter	{ports}	{'ip_protocol', 'instance', 'type', 'dest_port', 'hide_ip', 'protocol', 'dest_ip'}	<ul style="list-style-type: none"> <li>■ ip_protocol The IP version (IPv4 or IPv6).</li> <li>■ instance The CoreXL Firewall instance, on which the NAT pool is used.</li> <li>■ type The range of the ports. For IPv4: <ul style="list-style-type: none"> <li>• low (600 - 1023)</li> </ul> </li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
					<ul style="list-style-type: none"> <li>• high (10000 - 60000)</li> <li>• extra (60001 - 65000)</li> </ul> <p>For IPv6:</p> <ul style="list-style-type: none"> <li>• low6 (60003 - 10203)</li> <li>• high6 (10000 - 60000)</li> </ul>	

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
					<ul style="list-style-type: none"> <li>• extra6 (60001 - 65000)</li> <li>■ dest_port The destination port.</li> <li>■ hide_ip The IP address after NAT.</li> <li>■ protocol The IP protocol of the connection.</li> <li>■ dest ip The destination IP address.</li> </ul>	

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
system.network.nat.ports.limit	The total number of ports that can be used for the NAT pool.	Gauge	{ports}	{'ip_protocol', 'instance', 'type', 'dest_port', 'hide_ip', 'protocol', 'dest_ip'}	<ul style="list-style-type: none"> <li>■ ip_protocol The IP version (IPv4 or IPv6).</li> <li>■ instance The CoreXL Firewall instance, on which the NAT pool is used.</li> <li>■ type The range of the ports. For IPv4: <ul style="list-style-type: none"> <li>• low (600 - 1023)</li> </ul> </li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
					<ul style="list-style-type: none"> <li>• high (10000 - 60000)</li> <li>• extra (60001 - 65000)</li> </ul> <p>For IPv6:</p> <ul style="list-style-type: none"> <li>• low6 (60003 - 10203)</li> <li>• high6 (10000 - 60000)</li> </ul>

					<ul style="list-style-type: none"> <li>• extra6 (60001 - 65000)</li> <li>▪ dest_port The destination port.</li> <li>▪ hide_ip The IP address after NAT.</li> <li>▪ protocol The IP protocol of the connection.</li> <li>▪ dest ip The destination IP address.</li> </ul>	

# System > Filesystem

## CPView Gauges

1. Run: `cpview`
2. From the top, click **Overview**.
3. See the section **Disk space (top 3 used partitions)**.

## CLI

- Run these commands in Gaia Clish:

```
show system disk usage
```

```
show system lvm overview
```

- Run this command in the Expert mode:

```
df -kh
```

## Metric Information

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>system.filesystem.limit</code>	Total disk space, in Bytes.	Gauge	By	{'mountpoint'}	<ul style="list-style-type: none"> <li>▪ <code>mountpoint</code> The partition mount point.</li> </ul>	The same data for VSX Gateways (VS0) and other Virtual Systems.
<code>system.filesystem.usage</code>	How much disk space is currently used or free, in Bytes.	AsyncUpDownCounter	By	{'state', 'mountpoint'}	<ul style="list-style-type: none"> <li>▪ <code>state</code> Determines whether the value is for the used or the free disk space.</li> <li>▪ <code>mountpoint</code> The partition mount point.</li> </ul>	The same data for VSX Gateways (VS0) and other Virtual Systems.

# System > Input/Output

## CPView Gauges

1. Run: `cpview`
2. From the top, click **I/O > Overview**.

## CLI

Run these commands in the Expert mode:

```
top
```

```
iotop
```

```
iostat
```

## Metric Information

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>system.io.utilization</code>	Percentage of CPU time during which I/O requests were issued to the device (bandwidth utilization for the device). Device saturation occurs when this value is close to 100%.	Gauge	{percent}	{'device'}	<ul style="list-style-type: none"><li>device The I/O device name.</li></ul>	The same data for VSX Gateway (VS0) and other Virtual Systems.

# System > Gaia

## CPView Gauges

1. Run: `cpview`
2. From the top, click **SysInfo**.
3. In the section **Configuration Information**, see:
  - **Platform**.
  - **Configuration**.
4. See the section **Version Information**.

## CLI

- Run this command in Gaia Clish:

```
show version all
```

- Run this command in the Expert mode on the Multi-Domain Security Management Server (see the [CLI Reference Guide](#) for your version):

```
$MDSVERUTIL ALLCMAS
```

## Metric Information

For more information, see the [Gaia Administration Guide](#) for your version.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description
<code>system.gaia.module.version</code>	The branch name and the build number of installed products.	Gauge	{version}	{'module', 'name'}	<ul style="list-style-type: none"> <li>■ <b>module</b> The string "Firewall-1".</li> <li>■ <b>name</b> The branch name of the FireWall-1 product.</li> </ul>
<code>system.gaia.os.edition</code>	The operating system distribution and if the OS kernel is 32-bit or 64-bit.	Gauge	{edition}	{'edition'}	<ul style="list-style-type: none"> <li>■ <b>edition</b> The operating system kernel edition.</li> </ul>
<code>system.gaia.os.role</code>	The name of the installed Check Point product configuration.	Gauge	{role}	{'role'}	<ul style="list-style-type: none"> <li>■ <b>role</b> The Check Point product configuration (for example, "Check Point Security Gateway").</li> </ul>
<code>system.gaia.os.version</code>	Software release version.	Gauge	{version}	{'version'}	<ul style="list-style-type: none"> <li>■ <b>version</b> The software release version.</li> </ul>

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description
deployment.package.info	<p>Is this a recommended software version?            Note - Check Point marks the relevant software packages as recommended.            This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> <li>▪ <a href="#">R81.20 Jumbo Hotfix Accumulator</a>, Take 54 and higher</li> <li>▪ <a href="#">R81.10 Jumbo Hotfix Accumulator</a>, Take 135 and higher</li> <li>▪ <a href="#">R81 Jumbo Hotfix Accumulator</a>, Take 99 and higher</li> </ul>	Gauge	{recommended}	{'installation date', 'category', 'file name', 'build'}	<ul style="list-style-type: none"> <li>▪ installation date The installation date of the package.</li> <li>▪ category The package category:               <ul style="list-style-type: none"> <li>• major</li> <li>• jumbo</li> <li>• hotfix</li> </ul> </li> <li>▪ file name The file name of the package.</li> <li>▪ build The build number of the package.</li> </ul>

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description
env.domain	<p>Names of the Domains on a Multi-Domain Security Management Server.</p> <p>This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> <li>▪ <a href="#">R81.20 Jumbo Hotfix Accumulator</a>, Take 54 and higher</li> <li>▪ <a href="#">R81.10 Jumbo Hotfix Accumulator</a>, Take 135 and higher</li> <li>▪ <a href="#">R81 Jumbo Hotfix Accumulator</a>, Take 99 and higher</li> </ul>	Gauge	{name}	{'name'}	<ul style="list-style-type: none"> <li>▪ name The name of the Domain.</li> </ul>

# System > CoreXL

For more information, see the [Performance Tuning Administration Guide](#) for your version.

## CPView Gauges

1. Run: `cpview`
2. From the top, click **SysInfo**.
3. In the section **Configuration Information**, see:
  - **CoreXL Status**
  - **CoreXL instances**
  - **Dynamic Balancing Status**

## CLI

See the [CLI Reference Guide](#) for your version.

- Run this command in Gaia Clish or in the Expert mode:

```
fw ctl multik stat
```

```
show dynamic-balancing state
```

- Run this command in the Expert mode:

```
dynamic_balancing -p
```

## Metric Information

For more information, see the [Performance Tuning Administration Guide](#) for your version > chapter "CoreXL".

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>firewall.multik.state</code>	The state of CoreXL: <ul style="list-style-type: none"> <li>▪ on</li> <li>▪ off</li> </ul>	Gauge	{state}			Different data for each Virtual System.
<code>kernel.instances.count</code>	The number of CoreXL Firewall instances	Gauge	{instances}			Different data for each Virtual System.
<code>system.cpu.dynamic_balancing.state</code>	The state of the CoreXL Dynamic Balancing: <ul style="list-style-type: none"> <li>▪ On</li> <li>▪ Off</li> </ul>	Gauge	{state}			Different data for each Virtual System.

## System > SecureXL

For more information, see the [Performance Tuning Administration Guide](#) for your version.

## CPView Gauges

1. Run: `cpview`
2. From the top, click **SysInfo**.

In the section **Configuration Information**, see: **SecureXL Status**.

- **SecureXL Status**
- **UPPAK Status**

3. From the top, click **Advanced > SecureXL > Backplane > Route/ARP**.

See:

- **ARP Unresolved**
- **ipsctl-ppak-route-arp-drops**

4. From the top, click **Software-blades > VPN > SecureXL**.

In the section **VPN SecureXL Statistics**, see:

- **GTP tunnels created**
- **GTP concurrent tunnels**
- **GTP accel packets**
- **GTP F2F packets**
- **GTP spoofed packets**
- **GTP signaling packets**

## CLI

Run these commands in Gaia Clish or in the Expert mode (see the [CLI Reference Guide](#) for your version):

```
fwaccel stat
```

```
fwaccel stats
```

## Metric Information

For more information, see the [Performance Tuning Administration Guide](#) for your version > chapter "SecureXL".

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description
sxl.state	The state of SecureXL: <ul style="list-style-type: none"> <li>▪ 0.0 - Off</li> <li>▪ 1.0 - On</li> <li>▪ 2.0 - No license</li> <li>▪ 3.0 - Not initialized</li> <li>▪ -1 - Failed to get the state</li> </ul>	Gauge	{state}		

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description
<code>adv_prv.expired</code>	The number of the Hardware Acceleration (adpdrv) ARP Requests that failed to resolve.	Gauge	{requests}		
<code>adv_prv.errors.count</code>	Total number of errors related to Hardware Acceleration (adpdrv).	AsyncCounter	{errors}	{'name'}	<ul style="list-style-type: none"> <li>■ name The name of the error type: <ul style="list-style-type: none"> <li>• Service queue is full</li> <li>• Nexthop lookup failed</li> <li>• ARP resolve failed or queue was full</li> </ul> </li> </ul>

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description
<code>sxl.gtp.packets</code>	Total number of GTP packets in SecureXL.	AsyncCounter	{packets}	{'state'}	<ul style="list-style-type: none"> <li>■ state</li> <li>The category of the GTP packets: <ul style="list-style-type: none"> <li>• Accelerated</li> <li>• F2F</li> <li>• Spoofed</li> <li>• Signaling</li> </ul> </li> </ul>
<code>sxl.gtp.tunnels.count</code>	The number of concurrent GTP tunnels in SecureXL.	AsyncUpDownCounter	{tunnels}		
<code>sxl.gtp.tunnels.created</code>	Total number of GTP tunnels created in SecureXL.	AsyncCounter	tunnels		

# System > SecureXL > SYN Defender

## Notes:

- In SecureXL, the name of the feature is "Accelerated SYN Defender".
- In SmartConsole, the name of the applicable IPS protection is "SYN Attack".
- For more information, see the [Performance Tuning Administration Guide](#) for your version > chapter "SecureXL" > section "Accelerated SYN Defender".

These metrics are available in:

- [R82](#) and higher
- [R81.20 Jumbo Hotfix Accumulator](#) Take 41 and higher (PRJ-50104)
- [R81.10 Jumbo Hotfix Accumulator](#) Take 131 and higher (PRJ-50103)
- [R81 Jumbo Hotfix Accumulator](#) Take 99 and higher (PRJ-50102)
- [R80.40 Jumbo Hotfix Accumulator](#) Take 211 and higher (PRJ-50101)

## CPView Gauges

1. Run: `cpview`
2. From the top, click **Advanced > SecureXL > Advanced > SYN-Defender**.

## CLI

Run this command in Gaia Clish or in the Expert mode (see the [CLI Reference Guide](#) for your version):

```
fwaccel synatk
```

# Metric Information

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description
<code>sxl.synatk.configuration</code>	<p>SYN Defender Configuration:</p> <ul style="list-style-type: none"><li>▪ 0 - Uninitialized</li><li>▪ 1 - Disabled</li><li>▪ 2 - Monitoring</li><li>▪ 3 - Enforcing</li><li>▪ -1 - Failed to get the state</li></ul>	Gauge	{configuration}		
<code>sxl.synatk.status</code>	<p>SYN Defender Status:</p> <ul style="list-style-type: none"><li>▪ 0 - Uninitialized</li><li>▪ 1 - Disabled</li><li>▪ 2 - Invalid</li><li>▪ 3 - Under Attack</li><li>▪ 4 - Attack has just ended</li><li>▪ 5 - Normal</li></ul>	Gauge	{status}		

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description
<code>sxl.synatk.global_high_threshold</code>	SYN Defender Global High Threshold.	AsyncUpDownCounter	{connections}		
<code>sxl.synatk.interface_high_threshold</code>	SYN Defender Interface High Threshold.	AsyncUpDownCounter	{connections}		
<code>sxl.synatk.low_threshold</code>	SYN Defender Low Threshold.	AsyncUpDownCounter	{connections}		
<code>sxl.synatk.ifn_tab.topology</code>	SYN Defender Interface Topology: <ul style="list-style-type: none"> <li>▪ 0 - Excluded</li> <li>▪ 1 - Internal</li> <li>▪ 2 - External</li> <li>▪ -1 - Failed to get the topology</li> </ul>	Gauge	{topology}	{'name'}	<ul style="list-style-type: none"> <li>▪ name The name of the network interface.</li> </ul>

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description
<code>sxl.synatk.ifn_tab.state</code>	SYN Defender state on an interface: <ul style="list-style-type: none"> <li>▪ 0 - Disabled</li> <li>▪ 1 - Monitor</li> <li>▪ 2 - Ready</li> <li>▪ 3 - Active</li> <li>▪ 4 - Grace</li> <li>▪ -1 - Failed to get the state</li> </ul>	Gauge	{state}	{'name'}	<ul style="list-style-type: none"> <li>▪ name The name of the network interface.</li> </ul>
<code>sxl.synatk.ifn_tab.duration</code>	SYN Defender Active/Grace Duration.	Gauge	{time}	{'name'}	<ul style="list-style-type: none"> <li>▪ name The name of the network interface.</li> </ul>
<code>sxl.synatk.ifn_tab.non_established</code>	Number of SYN Defender Half-Open Connections.	AsyncUpDownCounter	{connections}	{'name'}	<ul style="list-style-type: none"> <li>▪ name The name of the network interface.</li> </ul>
<code>sxl.synatk.ifn_tab.sent_cookies</code>	Number of SYN Defender Sent Cookies.	AsyncCounter	{cookies}	{'name'}	<ul style="list-style-type: none"> <li>▪ name The name of the network interface.</li> </ul>

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description
sxl.synatk.ifn_tab.succ_validations	Number of SYN Defender Successful Validations.	AsyncCounter	{validations}	{'name'}	<ul style="list-style-type: none"><li>name The name of the network interface.</li></ul>

# System > Flofiler

 **Note** - "Flofiler" stands for "Flow Profiler".

## CPView Gauges

1. Run: `cpview`
2. From the top, click **Advanced > CPU-Profiler**:
  - a. Click **Components > All-Instances > Components**.
  - b. Click **PM-Stats > All-Instances**.
3. From the top, click **CPU > Top-Protocols > All-Instances**.

## Metric Information

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>flow_profiler.entities</code>	The number of top CPU consumer entities.	AsycUpDownCounter	{entities}	{'category', 'state'}	<ul style="list-style-type: none"> <li>■ <code>category</code> The Flofiler category:               <ul style="list-style-type: none"> <li>• 0 - Protocol</li> <li>• 1 - Component</li> <li>• 2 - Pattern Matcher</li> </ul> </li> <li>■ <code>state</code> There are two states:               <ul style="list-style-type: none"> <li>• <code>other</code> The entity is not in the list of top CPU consumers.</li> <li>• <code>top</code> The entity is in the list of the top CPU consumers.</li> </ul> </li> </ul>	Statistics do not exist.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
flow_profiler.utilization	The CPU utilization for each entity, in %.	Gauge	{percent}	{'category', 'name'}	<ul style="list-style-type: none"> <li>■ category The Flofiler category: <ul style="list-style-type: none"> <li>• 0 - protocol</li> <li>• 1 - component</li> <li>• 2 - pattern matcher</li> </ul> </li> <li>■ name The name of the entity which consumes CPU.</li> </ul>	Statistics do not exist.

# System > Firewall

## CPView Gauges

1. Run: `cpview`
2. From the top, click **SysInfo**.
3. In the section **General information**, see:
  - **Last policy install time**
  - **Last policy name**.

## CLI

Run this command in Gaia Clish or in the Expert mode (see the [CLI Reference Guide](#) for your version):

```
cpstat -f fw policy
```

## Metric Information

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
firewall.policy.name	The name of the last installed Access Control policy.	Gauge	{name}	{'name'}	<ul style="list-style-type: none"> <li>name The name of the last installed policy.</li> </ul>	Statistics exist only in the context of the VSX Gateway (VS0).
firewall.policy.time	Time of the last Access Control policy installation.	Gauge	{time}			Statistics exist only in the context of the VSX Gateway (VS0).

# System > Process > Top

## CPView Gauges

1. Run: `cpview`
2. From the top, click **CPU > Processes**.
3. Refer to these sections:
  - **Top 5 Processes - CPU**
  - **Top 5 Processes - RAM**

## CLI

Run this command in the Expert mode (and use the applicable keys to sort the required columns):

```
top
```

## Metric Information

## Metric Information

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
cpwd.pid	<p>PID of the process in Check Point WatchDog. This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> <li>▪ <a href="#">R81.20 Jumbo Hotfix Accumulator</a>, Take 54 and higher</li> <li>▪ <a href="#">R81.10 Jumbo Hotfix Accumulator</a>, Take 135 and higher</li> <li>▪ <a href="#">R81 Jumbo Hotfix Accumulator</a>, Take 99 and higher</li> </ul>	AsyncGauge	{pid}	{'app'}	<ul style="list-style-type: none"> <li>▪ app The application in Check Point WatchDog.</li> </ul>	The same data for VSX Gateway (VS0) and other Virtual Systems.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
cpwd.restarts	<p>Number of times Check Point WatchDog restarted the process. This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> <li>▪ <a href="#">R81.20 Jumbo Hotfix Accumulator</a>, Take 54 and higher</li> <li>▪ <a href="#">R81.10 Jumbo Hotfix Accumulator</a>, Take 135 and higher</li> <li>▪ <a href="#">R81 Jumbo Hotfix Accumulator</a>, Take 99 and higher</li> </ul>	AsyncCounter	{restarts}	{'app'}	<ul style="list-style-type: none"> <li>▪ app The application in Check Point WatchDog.</li> </ul>	The same data for VSX Gateway (VS0) and other Virtual Systems.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
cpwd.state	<p>State of the process in Check Point WatchDog. This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> <li>▪ <a href="#">R81.20 Jumbo Hotfix Accumulator</a>, Take 54 and higher</li> <li>▪ <a href="#">R81.10 Jumbo Hotfix Accumulator</a>, Take 135 and higher</li> <li>▪ <a href="#">R81 Jumbo Hotfix Accumulator</a>, Take 99 and higher</li> </ul>	AsyncGauge	{state}	{'app'}	<ul style="list-style-type: none"> <li>▪ app The application in Check Point WatchDog.</li> </ul>	The same data for VSX Gateway (VS0) and other Virtual Systems.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
cpwd.uptime	<p>Uptime of the process in Check Point WatchDog, in seconds.</p> <p>This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> <li>▪ <a href="#">R81.20 Jumbo Hotfix Accumulator</a>, Take 54 and higher</li> <li>▪ <a href="#">R81.10 Jumbo Hotfix Accumulator</a>, Take 135 and higher</li> <li>▪ <a href="#">R81 Jumbo Hotfix Accumulator</a>, Take 99 and higher</li> </ul>	AsyncCounter	s	{app}	<ul style="list-style-type: none"> <li>▪ app The application in Check Point WatchDog.</li> </ul>	The same data for VSX Gateway (VS0) and other Virtual Systems.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>process.cpu.usage</code>	<p>CPU utilization by the process, in %.</p> <p>This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> <li>▪ <a href="#">R81.20 Jumbo Hotfix Accumulator</a>, Take 54 and higher</li> <li>▪ <a href="#">R81.10 Jumbo Hotfix Accumulator</a>, Take 135 and higher</li> <li>▪ <a href="#">R81 Jumbo Hotfix Accumulator</a>, Take 99 and higher</li> </ul>	AsyncGauge	{percent}	{'cmd_name', 'process_name', 'pid'}	<ul style="list-style-type: none"> <li>▪ <code>cmd_name</code> The complete process command line (arguments and the full call list).</li> <li>▪ <code>process_name</code> The name of the process.</li> <li>▪ <code>pid</code> The PID of the process.</li> </ul>	The same data for VSX Gateway (VS0) and other Virtual Systems.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>process.disk.io.read</code>	<p>Total amount of disk I/O reads by the process, in bits. This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> <li>▪ <a href="#">R81.20 Jumbo Hotfix Accumulator</a>, Take 54 and higher</li> <li>▪ <a href="#">R81.10 Jumbo Hotfix Accumulator</a>, Take 135 and higher</li> <li>▪ <a href="#">R81 Jumbo Hotfix Accumulator</a>, Take 99 and higher</li> </ul>	AsyncCounter	b	{'cmd_name', 'process_name', 'pid'}	<ul style="list-style-type: none"> <li>▪ <code>cmd_name</code> The complete process command line (arguments and the full call list).</li> <li>▪ <code>process_name</code> The name of the process.</li> <li>▪ <code>pid</code> The PID of the process.</li> </ul>	The same data for VSX Gateway (VS0) and other Virtual Systems.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>process.disk.io.write</code>	<p>Total amount of disk I/O writes by the process, in bits. This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> <li>▪ <a href="#">R81.20 Jumbo Hotfix Accumulator</a>, Take 54 and higher</li> <li>▪ <a href="#">R81.10 Jumbo Hotfix Accumulator</a>, Take 135 and higher</li> <li>▪ <a href="#">R81 Jumbo Hotfix Accumulator</a>, Take 99 and higher</li> </ul>	AsyncCounter	b	{'cmd_name', 'process_name', 'pid'}	<ul style="list-style-type: none"> <li>▪ <code>cmd_name</code> The complete process command line (arguments and the full call list).</li> <li>▪ <code>process_name</code> The name of the process.</li> <li>▪ <code>pid</code> The PID of the process.</li> </ul>	The same data for VSX Gateway (VS0) and other Virtual Systems.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>process.rss_memory.bytes</code>	<p>The actual RAM utilization (RSS) by the process, in Bytes.</p> <p>This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> <li>▪ <a href="#">R81.20 Jumbo Hotfix Accumulator</a>, Take 54 and higher</li> <li>▪ <a href="#">R81.10 Jumbo Hotfix Accumulator</a>, Take 135 and higher</li> <li>▪ <a href="#">R81 Jumbo Hotfix Accumulator</a>, Take 99 and higher</li> </ul>	AsyncGauge	By	{'cmd_name', 'process_name', 'pid'}	<ul style="list-style-type: none"> <li>▪ <code>cmd_name</code> The complete process command line (arguments and the full call list).</li> <li>▪ <code>process_name</code> The name of the process.</li> <li>▪ <code>pid</code> The PID of the process.</li> </ul>	The same data for VSX Gateway (VS0) and other Virtual Systems.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>process.vms_memory.bytes</code>	<p>The total memory utilization (RAM and Virtual Memory, VMS) by the process, in Bytes. This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> <li>▪ <a href="#">R81.20 Jumbo Hotfix Accumulator</a>, Take 54 and higher</li> <li>▪ <a href="#">R81.10 Jumbo Hotfix Accumulator</a>, Take 135 and higher</li> <li>▪ <a href="#">R81 Jumbo Hotfix Accumulator</a>, Take 99 and higher</li> </ul>	AsyncGauge	By	{'cmd_name', 'process_name', 'pid'}	<ul style="list-style-type: none"> <li>▪ <code>cmd_name</code> The complete process command line (arguments and the full call list).</li> <li>▪ <code>process_name</code> The name of the process.</li> <li>▪ <code>pid</code> The PID of the process.</li> </ul>	The same data for VSX Gateway (VS0) and other Virtual Systems.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>process.memory.limit</code>	<p>Memory utilization limit (HWM) by the process, in Bytes. This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> <li>▪ <a href="#">R81.20 Jumbo Hotfix Accumulator</a>, Take 54 and higher</li> <li>▪ <a href="#">R81.10 Jumbo Hotfix Accumulator</a>, Take 135 and higher</li> <li>▪ <a href="#">R81 Jumbo Hotfix Accumulator</a>, Take 99 and higher</li> </ul>	AsyncGauge	By	{'cmd_name', 'process_name', 'pid'}	<ul style="list-style-type: none"> <li>▪ <code>cmd_name</code> The complete process command line (arguments and the full call list).</li> <li>▪ <code>process_name</code> The name of the process.</li> <li>▪ <code>pid</code> The PID of the process.</li> </ul>	The same data for VSX Gateway (VS0) and other Virtual Systems.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>process.uptime</code>	<p>Uptime of the process, in seconds. This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> <li>▪ <a href="#">R81.20 Jumbo Hotfix Accumulator</a>, Take 54 and higher</li> <li>▪ <a href="#">R81.10 Jumbo Hotfix Accumulator</a>, Take 135 and higher</li> <li>▪ <a href="#">R81 Jumbo Hotfix Accumulator</a>, Take 99 and higher</li> </ul>	AsyncCounter	s	{'cmd_name', 'process_name', 'pid'}	<ul style="list-style-type: none"> <li>▪ <code>cmd_name</code> The complete process command line (arguments and the full call list).</li> <li>▪ <code>process_name</code> The name of the process.</li> <li>▪ <code>pid</code> The PID of the process.</li> </ul>	The same data for VSX Gateway (VS0) and other Virtual Systems.

# ClusterXL

For more information, see the [ClusterXL Administration Guide](#) for your version.

## CPView Gauges

1. Run: `cpview`
2. From the top, click **Advanced > ClusterXL > Overview**.

## CLI

- Run these commands in Gaia Clish:

```
show cluster state
```

```
show cluster members pnotes {all | problem}
```

- Run these commands in the Expert mode:

```
cphaprob state
```

```
cphaprob [-l] list
```

## Metric Information

For more information, see the [ClusterXL Administration Guide](#) for your version.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
cluster_xl.members.state	Current ClusterXL member state.	Gauge	{state}	{'id', 'name'}	<ul style="list-style-type: none"> <li>▪ id The ID of the Cluster Member.</li> <li>▪ name The name of the Cluster Member.</li> </ul> <p>Cluster Member States:</p> <ul style="list-style-type: none"> <li>▪ 1 - LOST</li> <li>▪ 6 - DOWN</li> <li>▪ 11 - STANDBY</li> <li>▪ 16 - INIT</li> <li>▪ 21 - READY</li> <li>▪ 26 - ACTIVE</li> <li>▪ 27 - ACTIVE (!)</li> <li>▪ 28 - ACTIVE (!F)</li> <li>▪ 29 - ACTIVE (!P)</li> <li>▪ 30 - ACTIVE (!FP)</li> <li>▪ 31 - BACKUP</li> </ul> <p>Legend:</p>	Same as ClusterXL

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
					<ul style="list-style-type: none"> <li>▪ ACTIVE (!) - A problem was detected, but the Cluster Member still forwards packets, because it is the only member in the cluster, or because there are no other Active members in the cluster. In any other situation, the state of the member is Down.</li> <li>▪ ACTIVE (!F) - See above. The Cluster Member is in the freeze state.</li> <li>▪ ACTIVE (!P) - See above. This is the Pivot Cluster Member in the Load Sharing Unicast mode.</li> <li>▪ ACTIVE (!FP) - See above. This is the Pivot Cluster Member in the Load Sharing Unicast mode and it is in the freeze state.</li> </ul>	

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
cluster_xl.mode	<p>The ClusterXL mode:</p> <ul style="list-style-type: none"> <li>▪ HA - High Availability.</li> <li>▪ LS - Load Sharing</li> <li>▪ Active-Active.</li> </ul>	Gauge	{mode}		<p>ClusterXL Modes:</p> <ul style="list-style-type: none"> <li>▪ 0 - Load Sharing</li> <li>▪ 1 - High Availability Primary Up (the option "Switch to higher priority Cluster Member" in SmartConsole in the ClusterXL object)</li> <li>▪ 2- High Availability Active Up (the option "Maintain current active Cluster Member" in SmartConsole in the ClusterXL object)</li> <li>▪ 3 - Single Virtual System Failover</li> <li>▪ 4 - Virtual System Load Sharing</li> <li>▪ 5 - High Availability over Load Sharing (in Scalable Platforms)</li> <li>▪ 6 - Active-Active</li> <li>▪ 7 - Obsolete (denotes a 3rd-party cluster that only performs Delta Sync without health checks)</li> <li>▪ 8 - Undefined</li> <li>▪ -1 - Failed to get the mode</li> </ul>	Same as ClusterXL

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>cluster_xl.pnotes</code>	Names of Critical Devices that report their state as "problem".	Gauge	{pnotes}	{'pnotes'}	<ul style="list-style-type: none"><li>▪ pnotes The names of Critical Devices that report their state as "problem".</li></ul>	Same as ClusterXL

# VSX

For more information, see the [VSX Administration Guide](#) for your version.

## CPView Gauges

1. Run: `cpview`
2. From the top, click **Advanced > VSX**:
3. Click **Overview**.
4. Click **VSs > Configuration**.
5. Click **VSs > Physical-Resources**.
6. Click **VSs > Traffic**.
7. Click **Statistics**.

## CLI

- Run this command in the Expert mode:

```
vsx stat -v
```

- Run this command in Gaia Clish or in the Expert mode:

```
fw ctl multik stat
```

- Run this command in Gaia Clish:

```
show virtual-system all
```

## Metric Information

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description
vsx.core_xl.count	The number of CoreXL Firewall (FWK) instances configured on the Virtual System.	Gauge	{instances}	{'type', 'name'}	<ul style="list-style-type: none"> <li>type Type of the CoreXL Firewall instance: <ul style="list-style-type: none"> <li>IPv4</li> <li>IPv6</li> </ul> </li> <li>name Name of the Virtual System.</li> </ul>

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description
vsx.overview	Overview of Virtual Systems - installed policy and SIC Trust.	Gauge	{overview}	{'threat_prevention_policy', 'ac_policy_time', 'type', 'access_control_policy', 'name', 'trust'}	<ul style="list-style-type: none"> <li>■ threat_prevention_policy The name of the Threat Prevention policy installed on the Virtual System.</li> <li>■ ac_policy_time The name of the Access Control policy installed on the Virtual System.</li> <li>■ type Type of the Virtual System: <ul style="list-style-type: none"> <li>• MGMT</li> <li>• Virtual router</li> <li>• sys</li> <li>• switch</li> <li>• sys_bridge</li> </ul> </li> <li>■ access_control_policy</li> </ul>

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description
					<p>The time of the Access Control policy installation on the Virtual System.</p> <ul style="list-style-type: none"><li>■ name Name of the Virtual System.</li><li>■ trust The SIC Trust status of the Virtual System.</li></ul>

# VoIP

For more information, see the [VoIP Administration Guide](#) for your version.

## CPView Gauges

1. Run: `cpview`
2. From the top, click **Advanced > VoIP > SIP**.

## Metric Information

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>voip.sip.count</code>	Total number of SIP calls. This metric is available in: <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> </ul>	Gauge	{percent}	{'type', 'group'}	<ul style="list-style-type: none"> <li>▪ type UDP or TCP.</li> <li>▪ group Total or Not inspected.</li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
voip.sip.earlynat.capacity	Capacity of the kernel table that holds the ports for SIP Early NAT. This metric is available in: <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> </ul>	AsyncUpDownCounter	{percent}			Different data for each Virtual System.
voip.sip.max.reinv.count	Maximum number of "re-INVITE" messages per SIP call. This metric is available in: <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> </ul>	AsyncUpDownCounter	{messages}	{'type'}	<ul style="list-style-type: none"> <li>▪ type REINV.</li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
voip.sip.multicore.state	<p>Whether the VoIP SIP MultiCore feature is enabled or disabled (see <a href="#">sk180394</a>):</p> <ul style="list-style-type: none"> <li>▪ 0.0 - SIP MultiCore is disabled</li> <li>▪ 1.0 - SIP MultiCore is enabled (default)</li> </ul> <p>This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> </ul>	Gauge	{state}			Different data for each Virtual System.

# Network > Heavy Connections

## CPView Gauges

1. Run: `cpview`
2. From the top, click **CPU > Top-Connections > InstancesX-Y > InstanceZ**.
3. Refer to the section **Top Connections**.

## CLI

See the [CLI Reference Guide](#) for your version > Chapter "CoreXL Commands" > Section "fw ctl multik" > Section "fw ctl multik print\_heavy\_conn".

## Metric Information

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
network.heavy_connection.packets	<p>Number of packets that were transferred in the connection. This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> <li>▪ <a href="#">R81.20 Jumbo Hotfix Accumulator</a>, Take 54 and higher</li> <li>▪ <a href="#">R81.10 Jumbo Hotfix Accumulator</a>, Take 135 and higher</li> <li>▪ <a href="#">R81 Jumbo Hotfix Accumulator</a>, Take 99 and higher</li> </ul>	Gauge	{packets}	{'start_time', 'conn', 'service', 'identification_time', 'duration', 'instance_load', 'connection_instance_load'}	<ul style="list-style-type: none"> <li>▪ start_time The time when the heavy connection started.</li> <li>▪ conn The connection tuple - Source IP, Destination IP, Destination Port, and Protocol.</li> <li>▪ service Protocol and Port.</li> <li>▪ identification_time The time when the connection was recognized as heavy.</li> <li>▪ duration For how long the connection lasted, in seconds.</li> <li>▪ instance_load The CPU utilization of the CoreXL Firewall instance.</li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
					<ul style="list-style-type: none"><li>■ <code>connection_instance_load</code> The part of the connection in the CPU utilization of the CoreXL Firewall instance.</li></ul>	

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
network.heavy_connection.bytes	<p>Number of bytes that were transferred in the connection. This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> <li>▪ <a href="#">R81.20 Jumbo Hotfix Accumulator</a>, Take 54 and higher</li> <li>▪ <a href="#">R81.10 Jumbo Hotfix Accumulator</a>, Take 135 and higher</li> <li>▪ <a href="#">R81 Jumbo Hotfix Accumulator</a>, Take 99 and higher</li> </ul>	Gauge	{bytes}	{'start_time', 'conn', 'service', 'identification_time', 'duration', 'instance_load', 'connection_instance_load'}	<ul style="list-style-type: none"> <li>▪ start_time The time when the heavy connection started.</li> <li>▪ conn The connection tuple - Source IP, Destination IP, Destination Port, and Protocol.</li> <li>▪ service Protocol and Port.</li> <li>▪ identification_time The time when the connection was recognized as heavy.</li> <li>▪ duration For how long the connection lasted, in seconds.</li> <li>▪ instance_load The CPU utilization of the CoreXL Firewall instance.</li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
					<ul style="list-style-type: none"><li>■ <code>connection_instance_load</code> The part of the connection in the CPU utilization of the CoreXL Firewall instance.</li></ul>	

## Network > Network Probes (VPN)

On Security Gateways R82 and higher, you can configure Network Probes to monitor the status of Site-to-Site VPN Tunnels. See [sk181994](#).

For more information, see the [Site to Site VPN Administration Guide](#) for your version.

In addition, see:

- ["VPN > Probes" on page 182](#).
- ["Blades > VPN" on page 194](#).

### CLI

Run this command in the Expert mode:

```
probemon help
```

## Metric Information

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>network.probes.state</code>	<p>The state of the Network Probe. This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> </ul>	Gauge	{state}	{'id', 'name', 'destination', 'source'}	<ul style="list-style-type: none"> <li>▪ <code>id</code> The ID of the Network Probe.</li> <li>▪ <code>name</code> The name of the Network Probe.</li> <li>▪ <code>destination</code> The destination address of the Network Probe.</li> <li>▪ <code>source</code> The source address of the Network Probe.</li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>network.probes.mode</code>	<p>The monitoring mode of the Network Probe:</p> <ul style="list-style-type: none"> <li>▪ ICMP</li> <li>▪ HTTP</li> </ul> <p>This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> </ul>	Gauge	{mode}	{'id'}	<ul style="list-style-type: none"> <li>▪ id The ID of the Network Probe.</li> </ul>	Different data for each Virtual System.
<code>network.probes.last_probe</code>	<p>The time of the last report from the Network Probe.</p> <p>This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> </ul>	Gauge	{second}/s	{'id'}	<ul style="list-style-type: none"> <li>▪ id The ID of the Network Probe.</li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>network.probes.last_status_change</code>	The time of the last change in the state of the Network Probe. This metric is available in: <ul style="list-style-type: none"><li>▪ <a href="#">R82</a> and higher</li></ul>	Gauge	{second}/s	{'id'}	<ul style="list-style-type: none"><li>▪ id The ID of the Network Probe.</li></ul>	Different data for each Virtual System.

## VPN > Probes

On Security Gateways R82 and higher, you can configure Network Probes to monitor the status of Site-to-Site VPN Tunnels. See [sk181994](#).

For more information, see the [Site to Site VPN Administration Guide](#) for your version.

In addition, see:

- ["Network > Network Probes \(VPN\)" on page 178](#).
- ["Blades > VPN" on page 194](#).

## CLI

Run these commands in the Expert mode (see the [CLI Reference Guide](#) for your version):

```
probemon help
```

```
vpn tu tlist
```

## Metric Information

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
vpn.probes.tunnel	<p>The state of the VPN tunnel:</p> <ul style="list-style-type: none"> <li>▪ 0 - Down</li> <li>▪ Any positive integer - Up (this value is the outbound SPI of the VPN tunnel)</li> </ul> <p>This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> </ul>	Gauge	{tunnel}	{'id', 'mspi', 'peer_name', 'peer_main_ip', 'remote_ip', 'local_ip', 'tunnel_methods', 'local_ts', 'remote_ts', 'tunnel_type'}	<ul style="list-style-type: none"> <li>▪ id The ID of the Network Probe.</li> <li>▪ mspi The MSPI of the VPN tunnel.</li> <li>▪ peer_name The name of the VPN peer.</li> <li>▪ peer_main_ip The main IP address of VPN peer.</li> <li>▪ remote_ip The IP address of VPN peer for this VPN tunnel.</li> <li>▪ local_ip</li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
					<p>The local IP address for this VPN tunnel.</p> <ul style="list-style-type: none"> <li>■ tunnel_methods VPN tunnel encryption methods.</li> <li>■ local_ts Local Traffic Selector (destination subnets).</li> <li>■ remote_ts Traffic Selector on the VPN peer (destination subnets).</li> <li>■ tunnel_type The VPN tunnel type (SSL, NAT-T, Visitor Mode, and so on).</li> </ul>	

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>vpn.probes.tunnel_generated_time</code>	The time when the VPN Tunnel was established. This metric is available in: <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> </ul>	Gauge	{second}/s	{'id'}	<ul style="list-style-type: none"> <li>▪ id The ID of the Network Probe.</li> </ul>	Different data for each Virtual System.
<code>vpn.probes.tunnel_expire_time</code>	The time when the VPN Tunnel will expire. This metric is available in: <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> </ul>	Gauge	{second}/s	{'id'}	<ul style="list-style-type: none"> <li>▪ id The ID of the Network Probe.</li> </ul>	Different data for each Virtual System.
<code>vpn.probes.tunnel_encrypted_bytes</code>	The total number of encrypted bytes. This metric is available in: <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> </ul>	Gauge	By	{'id'}	<ul style="list-style-type: none"> <li>▪ id The ID of the Network Probe.</li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>vpn.probes.tunnel_encrypt_throughput</code>	VPN tunnel encrypted throughput. This metric is available in: <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> </ul>	Gauge	b/s	{'id'}	<ul style="list-style-type: none"> <li>▪ id The ID of the Network Probe.</li> </ul>	Different data for each Virtual System.
<code>vpn.probes.tunnel_decrypted_bytes</code>	The total number of decrypted bytes. This metric is available in: <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> </ul>	Gauge	By	{'id'}	<ul style="list-style-type: none"> <li>▪ id The ID of the Network Probe.</li> </ul>	Different data for each Virtual System.
<code>vpn.probes.tunnel_decrypt_throughput</code>	VPN tunnel decrypted throughput. This metric is available in: <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> </ul>	Gauge	b/s	{'id'}	<ul style="list-style-type: none"> <li>▪ id The ID of the Network Probe.</li> </ul>	Different data for each Virtual System.

# Blades > Status and Update

## CPView Gauges

1. Run: `cpview`
2. From the top, click **Software-blades > Overview**.

## CLI

Run these commands in Gaia Clish or in the Expert mode (see the [CLI Reference Guide](#) for your version):

```
cpstat
```

```
cpstat -f <Flavor> <Feature>
```

Software Blade	Command to See the Status
Application Control	<ul style="list-style-type: none"> <li>▪ To the Software Blade status: <code>cpstat -f default appi</code></li> <li>▪ To the Software Blade subscription status: <code>cpstat -f subscription_status appi</code></li> <li>▪ To the Software Blade update status: <code>cpstat -f update_status appi</code></li> </ul>

Software Blade	Command to See the Status
URL Filtering	<ul style="list-style-type: none"> <li>▪ To the Software Blade status: <code>cpstat -f default urlf</code></li> <li>▪ To the Software Blade subscription status: <code>cpstat -f subscription_status urlf</code></li> <li>▪ To the Software Blade update status: <code>cpstat -f update_status urlf</code></li> </ul>
Anti-Virus and Anti-Bot	<ul style="list-style-type: none"> <li>▪ To the Software Blade status: <code>cpstat -f default antimalware</code></li> <li>▪ To the Software Blade subscription status: <code>cpstat -f subscription_status antimalware</code></li> <li>▪ To the Software Blade update status: <code>cpstat -f update_status antimalware</code></li> </ul>
Threat Extraction	<ul style="list-style-type: none"> <li>▪ To the Software Blade status and engine version: <code>cpstat -f default scrub</code></li> <li>▪ To the Software Blade subscription status: <code>cpstat -f subscription_status scrub</code></li> </ul>

## Metric Information

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description
blades.state	<p>Is the Software Blade active?</p> <ul style="list-style-type: none"> <li>▪ 0 - Enabled</li> <li>▪ 1 - Disabled</li> <li>▪ 2 - Unknown</li> </ul> <p>This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> <li>▪ <a href="#">R81.20 Jumbo Hotfix Accumulator</a>, Take 54 and higher</li> <li>▪ <a href="#">R81.10 Jumbo Hotfix Accumulator</a>, Take 135 and higher</li> <li>▪ <a href="#">R81 Jumbo Hotfix Accumulator</a>, Take 99 and higher</li> </ul>	AsyncGauge	{state}	{'name'}	<ul style="list-style-type: none"> <li>▪ name The name of the Software Blade.</li> </ul>

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description
blades.entitlement	<p>Is the Software Blade entitled to download updates?</p> <ul style="list-style-type: none"> <li>▪ 0 - Entitled</li> <li>▪ 1 - Not entitled</li> <li>▪ 2 - Evaluation</li> <li>▪ 3 - Expired</li> <li>▪ 4 - Unavailable</li> <li>▪ 5 - Unknown status</li> <li>▪ 6 - Not applicable</li> </ul> <p>This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> <li>▪ <a href="#">R81.20 Jumbo Hotfix Accumulator</a>, Take 54 and higher</li> <li>▪ <a href="#">R81.10 Jumbo Hotfix Accumulator</a>, Take 135 and higher</li> <li>▪ <a href="#">R81 Jumbo Hotfix Accumulator</a>, Take 99 and higher</li> </ul>	AsyncGauge	{entitlement}	{'name'}	<ul style="list-style-type: none"> <li>▪ name The name of the Software Blade.</li> </ul>

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description
blades.expiration	<p>When does the Software Blade entitlement expire (in seconds)?</p> <p>This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> <li>▪ <a href="#">R81.20 Jumbo Hotfix Accumulator</a>, Take 54 and higher</li> <li>▪ <a href="#">R81.10 Jumbo Hotfix Accumulator</a>, Take 135 and higher</li> <li>▪ <a href="#">R81 Jumbo Hotfix Accumulator</a>, Take 99 and higher</li> </ul>	AsyncGauge	s	{'name'}	<ul style="list-style-type: none"> <li>▪ name The name of the Software Blade.</li> </ul>
blades.update.state	Update status of Software Blades.	Gauge	{state}	{'entity'}	<ul style="list-style-type: none"> <li>▪ entity The name of the Software Blade.</li> </ul>

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description
blades.update.time	Update time of Software Blades.	Gauge	{time}	{'entity', 'name'}	<ul style="list-style-type: none"><li>entity The name of the Software Blade.</li><li>name The time of the last update.</li></ul>

## Blades > VPN

For more information, see the [Site to Site VPN Administration Guide](#) for your version.

In addition, see:

- ["Network > Network Probes \(VPN\)" on page 178.](#)
- ["VPN > Probes" on page 182.](#)

## CPView Gauges

1. Run: `cpview`
2. From the top, click **Software-blade > VPN**.
3. Click **Overview**.
4. Click **Detailed**.
5. Click **Tunnel-Monitoring**.
6. Click **SecureXL**.

## Metric Information

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
system.network.blades.vpn.active_clients	Current number of connected Remote Access VPN clients.	AsyncUpDownCounter	{Counter}			The same data for VSX Gateways (VS0) and other Virtual Systems.
system.network.blades.vpn.all_ike_errors	Total number of all IKE errors.	AsyncCounter	{errors}			The same data for VSX Gateways (VS0) and other Virtual Systems.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
system.network.blades.vpn.ike_sas	Number of concurrent IKE SAs.	AsyncUpDownCounter	{sas}			The same data for VSX Gateways (VS0) and other Virtual Systems.
system.network.blades.vpn.kernel_limit_reached_count	Sum of values from the VPN limit counters (ike2peer_reach_limit) and (vpn_queues_reach_limit).	AsyncUpDownCounter	{errors}			The same data for VSX Gateways (VS0) and other Virtual Systems.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
system.network.blades.vpn.max_ike_sas	Maximum number of IKE SAs that this Security Gateway initiated.	Gauge	{sas}			The same data for VSX Gateways (VS0) and other Virtual Systems.
system.network.blades.vpn.total_sas	Total number of IKE SAs.	AsyncCounter	{sas}			The same data for VSX Gateways (VS0) and other Virtual Systems.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
vpn.clients	Current number of connected Remote Access VPN clients.	AsyncUpDownCounter	{clients}	{mode}	<ul style="list-style-type: none"> <li>■ mode The mode associated with the client:                             <ul style="list-style-type: none"> <li>• Office</li> <li>• Visitor</li> <li>• SNX</li> <li>• L2TP</li> </ul> </li> </ul>	The same data for VSX Gateways (VS0) and other Virtual Systems.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
vpn.compression.bytes	VPN Data related to packets compression.	AsyncCounter	By	{state}	<ul style="list-style-type: none"> <li>■ state The compression status:                             <ul style="list-style-type: none"> <li>• Before Compression</li> <li>• After Compression</li> <li>• Compression Overhead</li> <li>• Non Compressed</li> </ul> </li> </ul>	The same data for VSX Gateways (VS0) and other Virtual Systems.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
vpn.compression.packets	VPN Data related to packets compression.	AsyncCounter	{packets}	{state}	<ul style="list-style-type: none"> <li>■ state The compression status:                             <ul style="list-style-type: none"> <li>• Before Compression</li> <li>• After Compression</li> <li>• Compression Overhead</li> <li>• Non Compressed</li> </ul> </li> </ul>	The same data for VSX Gateways (VS0) and other Virtual Systems.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
vpn.errors	VPN errors (includes ESP, ESP/UDP, fragmentation, and other errors).	AsyncCounter	{errors}	{'type', 'state'}	<ul style="list-style-type: none"> <li>■ type The type of the error:                             <ul style="list-style-type: none"> <li>• General</li> <li>• IPSEC</li> <li>• IKE</li> <li>• Accelerated VPN</li> </ul> </li> <li>■ state The reason for this error. For example:                             <ul style="list-style-type: none"> <li>• Encrypted</li> <li>• Decrypted</li> <li>• Should have been encrypted</li> <li>• Should be clear text packets</li> <li>• Authentication</li> </ul> </li> </ul>	The same data for VSX Gateways (VS0) and other Virtual Systems.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
					<ul style="list-style-type: none"><li>No response from peer</li></ul>	

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
vpn.ike.concurrent	Concurrent IKE SAs.	AsyncUpDownCounter	{sas}	{'type'}	<ul style="list-style-type: none"> <li>■ type</li> <li>The IKE SA type:               <ul style="list-style-type: none"> <li>• IKE v1</li> <li>• IKE v2</li> <li>• IKE SAs Interoperable Devices</li> <li>• IKE SAs Dynamically Assigned IP addresses</li> <li>• IKE SAs Remote Access Endpoints</li> <li>• IKE SAs IPv6</li> <li>• IKE SAs By Machine</li> <li>• IKE SAs By Peer</li> </ul> </li> </ul>	The same data for VSX Gateways (VS0) and other Virtual Systems.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
					<ul style="list-style-type: none"><li>• Concurrent IKE SA negotiations</li><li>• Concurrent IKE SA exchange attempts</li><li>• Concurrent IKE SA exchange attempts by machine</li><li>• Concurrent IKE SAs with aggressive mode</li></ul>	

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
vpn.ike.count	Total number of IKE SAs.	AsyncCounter	{sas}	{'type'}	<ul style="list-style-type: none"> <li>■ type               <ul style="list-style-type: none"> <li>The SA type:                   <ul style="list-style-type: none"> <li>• SAs Init By Machine</li> <li>• SAs Init By Peer</li> <li>• IPSec Inbound SAs</li> <li>• IPSec Outbound SAs</li> </ul> </li> </ul> </li> </ul>	The same data for VSX Gateways (VS0) and other Virtual Systems .
vpn.ike.max	Maximum number of concurrent IKE SAs that this Security Gateway initiated.	Gauge	{sas}	{'type'}	<ul style="list-style-type: none"> <li>■ type               <ul style="list-style-type: none"> <li>The SA type:                   <ul style="list-style-type: none"> <li>• SAs Init By Machine</li> <li>• SAs Init By Peer</li> </ul> </li> </ul> </li> </ul>	The same data for VSX Gateways (VS0) and other Virtual Systems .

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
vpn.ike.negotiations.max	Maximum number of concurrent IKE SA negotiations.	Gauge	{sas}			The same data for VSX Gateways (VS0) and other Virtual Systems .
vpn.ike.peers	Number of concurrent IKE peers.	Gauge	{peers}			The same data for VSX Gateways (VS0) and other Virtual Systems .

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
vpn.ioctls	Total number of kernel IOCTL calls.	AsyncCounter	{ioctls}			The same data for VSX Gateways (VS0) and other Virtual Systems.
vpn.ipsec.fragmentation.count	Number of fragmentation's caused due to IPsec.	AsyncCounter	{fragmentations}			The same data for VSX Gateways (VS0) and other Virtual Systems.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
vpn.ipsec.fragmentation.drops	Total number of times the Security Gateway dropped traffic that was fragmented because of IPsec.	AsyncCounter	{drops}			The same data for VSX Gateways (VS0) and other Virtual Systems.
vpn.kernel_traps	Total number of kernel trap calls.	AsyncCounter	{traps}			The same data for VSX Gateways (VS0) and other Virtual Systems.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
vpn.packets	Total number of VPN related packets since the last boot.	AsyncCounter	{packets}	{'type'}	<ul style="list-style-type: none"> <li>■ type The type of packets: <ul style="list-style-type: none"> <li>• Encrypted</li> <li>• Decrypted</li> </ul> </li> </ul>	The same data for VSX Gateways (VS0) and other Virtual Systems.
vpn.restarts	Total number of VPN restarts or VPN policy reloads.	AsyncCounter	{restarts}	{'type', 'name'}	<ul style="list-style-type: none"> <li>■ type What kind of entity is counted: <ul style="list-style-type: none"> <li>• Process</li> <li>• Policy</li> </ul> </li> <li>■ name The name of the entity: <ul style="list-style-type: none"> <li>• VPND</li> <li>• IKED</li> </ul> </li> </ul>	The same data for VSX Gateways (VS0) and other Virtual Systems.

## Blades > IDA

For more information, see the [Identity Awareness Administration Guide](#) for your version.

### CPView Gauges

1. Run: `cpview`
2. From the top, click **Software-blades > IDA**.

### CLI

Run these commands in the Expert mode (see the [CLI Reference Guide](#) for your version):

```
adlog
```

```
pdp
```

```
pep show
```

## Metric Information

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>ida.ad_query.events</code>	AD Query data.	AsyncCounter	{events}	{'ip', 'name'}	<ul style="list-style-type: none"> <li>▪ ip The destination IP address of the AD query.</li> <li>▪ name The name of the AD query.</li> </ul>	Different data for each Virtual System.
<code>ida.ad_query.state</code>	AD Query state.	Gauge	{state}	{'ip', 'name'}	<ul style="list-style-type: none"> <li>▪ ip The destination IP address of the AD query.</li> <li>▪ name The name of the AD query.</li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>ida.authenticated</code>	Total number of authenticated objects that Identity Awareness acquired.	AsyncCounter	{objects}	{'entity', 'method'}	<ul style="list-style-type: none"> <li>■ <code>entity</code> The owner (user or machine).</li> <li>■ <code>method</code> The authentication method: <ul style="list-style-type: none"> <li>• Kerberos</li> <li>• User and password</li> <li>• AD Query</li> <li>• SAML</li> </ul> </li> </ul>	Different data for each Virtual System.
<code>ida.authenticated.count</code>	Total number of authenticated objects that Identity Awareness acquired.	AsyncCounter	{objects}	{'entity'}	<ul style="list-style-type: none"> <li>■ <code>entity</code> The owner (user or machine).</li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>ida.components.state</code>	The state of the Identity Awareness component (PDP, or PEP).	Gauge	{state}	{'local', 'name'}	<ul style="list-style-type: none"> <li>■ <code>local</code> Is the component running on the Security Gateway you query?</li> <li>■ <code>name</code> The name of the PDP or PEP server.</li> </ul>	Different data for each Virtual System.
<code>ida.components.disconnections</code>	Number of times the component disconnected.	AsyncCounter	{disconnections}	{'name'}	<ul style="list-style-type: none"> <li>■ <code>name</code> The name of the PDP or PEP server.</li> </ul>	Different data for each Virtual System.
<code>ida.memory</code>	Memory used by Identity Awareness.	AyncCounter	By	{'type', 'entity'}	<ul style="list-style-type: none"> <li>■ <code>type</code> The type of the buffer.</li> <li>■ <code>entity</code> The kind of session.</li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
ida.logins.successful	Total number of successful logins related to Identity Awareness.	AsyncCounter	{logins}	{'entity', 'method'}	<ul style="list-style-type: none"> <li>■ entity The login owner (user or machine).</li> <li>■ method The authentication method: <ul style="list-style-type: none"> <li>• Kerberos</li> <li>• User and password</li> </ul> </li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
ida.logins.count	Total number of logins related to Identity Awareness.	AsyncCounter	{logins}	{'method'}	<ul style="list-style-type: none"> <li>■ method</li> <li>The authentication method: <ul style="list-style-type: none"> <li>• Captive Portal</li> <li>• Total Identity Agents</li> <li>• AD Query</li> <li>• Full Identity Agents for Windows OS</li> <li>• Lite Identity Agents for Windows OS</li> <li>• Mac Identity Agents for macOS</li> </ul> </li> </ul>	Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
					<ul style="list-style-type: none"> <li>• Identity Agents for Windows Terminal Server</li> <li>• RADIUS Accounting</li> <li>• Remote Access VPN</li> <li>• Identity Collectors (Active Directory)</li> <li>• Identity Collectors (Cisco ISE)</li> <li>• Identity Collectors (eDirectory)</li> <li>• Identity Awareness API</li> </ul>	

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
					<ul style="list-style-type: none"> <li>Identity Awareness acquired from the Packet Tagging protection</li> </ul>	
<code>ida.unauthenticated</code>	Total number of unauthenticated objects that Identity Awareness acquired.	AsyncCounter	{objects}			Different data for each Virtual System.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>ida.logged.unsuccessful</code>	Total number of unsuccessful logins related to Identity Awareness.	AsyncCounter	{logins}	{'entity', 'method'}	<ul style="list-style-type: none"> <li>■ <code>entity</code> The owner (user or machine).</li> <li>■ <code>method</code> The authentication method: <ul style="list-style-type: none"> <li>• Kerberos</li> <li>• User and password</li> </ul> </li> </ul>	Different data for each Virtual System.
<code>ida.user_directory.count</code>	Total number of User Directory queries.	AsyncCounter	{queries}	{'state'}	<ul style="list-style-type: none"> <li>■ <code>state</code> Did the query succeed?</li> </ul>	Different data for each Virtual System.

## Hardware > Model

<code>hardware.fan.min</code>	The minimal value that is valid.	Gauge	RPM	{'name'}	<ul style="list-style-type: none"> <li>name The name of the Fan Unit.</li> </ul>	Statistics exist only in the context of the VS0.
<code>hardware.fan.state</code>	The state of the sensor: <ul style="list-style-type: none"> <li>0 - Works correctly</li> <li>1 - Failed</li> </ul>	Gauge	{state}	{'name'}	<ul style="list-style-type: none"> <li>name The name of the Fan Unit.</li> </ul>	Statistics exist only in the context of the VS0.

# Hardware > BIOS

For information about hardware thresholds on Check Point Appliances, see [sk119232](#).

1. Run: `cpview`
2. From the top, click **Hardware-Health > Bios**.

## CLI

Run this command in Gaia Clish:

```
show sysenv bios
```

## Metric Information

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>hardware.bios</code>	<p>Which BIOS is used:</p> <ul style="list-style-type: none"> <li>0.0 - Secondary</li> <li>1.0 - Primary (default)</li> </ul> <p>This metric is available in:</p> <ul style="list-style-type: none"> <li><a href="#">R82</a> and higher</li> </ul>	Gauge	{state}	{'name'}	<ul style="list-style-type: none"> <li>name Primary or Secondary.</li> </ul>	Statistics exist only in the context of the VS0.
<code>hardware.bios.state</code>	<p>State of BIOS:</p> <ul style="list-style-type: none"> <li>1.0 - Up</li> <li>0.0 - Down</li> </ul>	Gauge	{state}	{'name'}	<ul style="list-style-type: none"> <li>name Up or Down.</li> </ul>	Statistics exist only in the context of the VS0.

## OtlpAgent > Scripts

For more information about this feature, see ["Custom Metrics" on page 265](#).

For more information about OpenTelemetry Agent (OtlpAgent), see [sk181615](#).

## Metric Information

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>script.cpu.usage</code>	<p>CPU utilization by the custom script, in %.</p> <p>This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> <li>▪ <a href="#">R81.20 Jumbo Hotfix Accumulator</a>, Take 54 and higher</li> <li>▪ <a href="#">R81.10 Jumbo Hotfix Accumulator</a>, Take 135 and higher</li> <li>▪ <a href="#">R81 Jumbo Hotfix Accumulator</a>, Take 99 and higher</li> </ul>	AsyncGauge	{percent}	{'command', 'interval', 'output size'}	<ul style="list-style-type: none"> <li>▪ <code>command</code> The name of the custom script file.</li> <li>▪ <code>interval</code> The interval to run the custom script.</li> <li>▪ <code>output size</code> The size of the custom script's output.</li> </ul>	Depends on the custom script.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>script.memory.usage</code>	<p>Memory utilization by the custom script, in Megabytes. This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> <li>▪ <a href="#">R81.20 Jumbo Hotfix Accumulator</a>, Take 54 and higher</li> <li>▪ <a href="#">R81.10 Jumbo Hotfix Accumulator</a>, Take 135 and higher</li> <li>▪ <a href="#">R81 Jumbo Hotfix Accumulator</a>, Take 99 and higher</li> </ul>	AsyncGauge	{Mb}	{'command', 'interval', 'output size'}	<ul style="list-style-type: none"> <li>▪ <code>command</code> The name of the custom script file.</li> <li>▪ <code>interval</code> The interval to run the custom script.</li> <li>▪ <code>output size</code> The size of the custom script's output.</li> </ul>	Depends on the custom script.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>script.runtime</code>	<p>Runtime of the custom script, in seconds.</p> <p>This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> <li>▪ <a href="#">R81.20 Jumbo Hotfix Accumulator</a>, Take 54 and higher</li> <li>▪ <a href="#">R81.10 Jumbo Hotfix Accumulator</a>, Take 135 and higher</li> <li>▪ <a href="#">R81 Jumbo Hotfix Accumulator</a>, Take 99 and higher</li> </ul>	AsyncGauge	s	{'command', 'interval', 'output size'}	<ul style="list-style-type: none"> <li>▪ <code>command</code> The name of the custom script file.</li> <li>▪ <code>interval</code> The interval to run the custom script.</li> <li>▪ <code>output size</code> The size of the custom script's output.</li> </ul>	Depends on the custom script.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>script.status</code>	<p>Status of the custom script:</p> <ul style="list-style-type: none"> <li>▪ 0.0 - Succeeded</li> <li>▪ 1.0 - Failed</li> <li>▪ 2.0 - Terminated</li> <li>▪ 3.0 - CPU utilization exceeded the threshold of 5% (you cannot change this threshold)</li> <li>▪ 4.0 - Memory utilization exceeded the threshold of 10MB (you cannot change this threshold)</li> </ul>	AsyncGauge	{status}	{'command', 'interval', 'output size'}	<ul style="list-style-type: none"> <li>▪ <code>command</code> The name of the custom script file.</li> <li>▪ <code>interval</code> The interval to run the custom script.</li> <li>▪ <code>output size</code> The size of the custom script's output.</li> </ul>	Depends on the custom script.

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
	<ul style="list-style-type: none"><li>▪ 5.0 - Runtime exceeded the threshold of 5 minutes (you cannot change this threshold)</li><li>▪ -1 - Error with the custom metric configuration</li></ul>					

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
	<p>This metric is available in:</p> <ul style="list-style-type: none"><li>▪ <a href="#">R82</a> and higher</li><li>▪ <a href="#">R81.20 Jumbo Hotfix Accumulator</a>, Take 54 and higher</li><li>▪ <a href="#">R81.10 Jumbo Hotfix Accumulator</a>, Take 135 and higher</li><li>▪ <a href="#">R81 Jumbo Hotfix Accumulator</a>, Take 99 and higher</li></ul>					

# OtlpAgent > Version

For more information about OpenTelemetry Agent (OtlpAgent), see [sk181615](#).

## Metric Information

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description	VSX Behavior
<code>otlp_agent.version</code>	<p>The version of the Skyline OpenTelemetry Agent (OtlpAgent). This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> <li>▪ <a href="#">R81.20 Jumbo Hotfix Accumulator</a>, Take 54 and higher</li> <li>▪ <a href="#">R81.10 Jumbo Hotfix Accumulator</a>, Take 135 and higher</li> <li>▪ <a href="#">R81 Jumbo Hotfix Accumulator</a>, Take 99 and higher</li> </ul>	AsyncGauge	{version}	{'version', 'branch'}	<ul style="list-style-type: none"> <li>▪ <code>version</code> The version of the agent.</li> <li>▪ <code>branch</code> The software branch of the agent.</li> </ul>	The same data for VSX Gateway (VS0) and other Virtual Systems.

# API on the Management Server

For more information, see the [Check Point Management API Reference](#).

## Metric Information

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description
mgmt.proc.ready	<p>Are the require processes ready on the Management Server?</p> <p>This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> <li>▪ <a href="#">R81.20 Jumbo Hotfix Accumulator</a>, Take 54 and higher</li> <li>▪ <a href="#">R81.10 Jumbo Hotfix Accumulator</a>, Take 135 and higher</li> <li>▪ <a href="#">R81 Jumbo Hotfix Accumulator</a>, Take 99 and higher</li> </ul>	AsyncGauge	{is_ready}	{'process_name', 'state', 'more'}	<ul style="list-style-type: none"> <li>▪ process_name The name of the process (FWM, CPM, API, and so on).</li> <li>▪ state The state of the process (Up or Down).</li> <li>▪ more An additional description for the process status.</li> </ul>

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description
api.call.count	<p>Number of calls to each API command.</p> <p>This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> <li>▪ <a href="#">R81.20 Jumbo Hotfix Accumulator</a>, Take 54 and higher</li> <li>▪ <a href="#">R81.10 Jumbo Hotfix Accumulator</a>, Take 135 and higher</li> <li>▪ <a href="#">R81 Jumbo Hotfix Accumulator</a>, Take 99 and higher</li> </ul>	AsyncGauge	{count}	{'command'}	<ul style="list-style-type: none"> <li>▪ command The name of the API command.</li> </ul>

# Maestro Orchestrator

## CPView Gauges

1. Run: `cpview`
2. From the top, click **Orchestrator** > click the applicable tab.

## CLI

On the Orchestrator, run these commands in the Expert mode:

```
orch_stat -h
```

```
orch_stat --LLDP
```

```
orch_stat --lag [--verbose]
```

```
orch_stat --ports
```

## Metric Information

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description
<code>orchestrator.deployment.member_id</code>	<p>The Member ID of this Orchestrator on its Maestro Site. This metric is available in:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">R82</a> and higher</li> </ul>	Gauge		{'device_type', 'serial', 'mac_address', 'site_id'}	<ul style="list-style-type: none"> <li>▪ <code>device_type</code> The hardware model of the Orchestrator.</li> <li>▪ <code>serial</code> The serial number of the Orchestrator.</li> <li>▪ <code>mac_address</code> The MAC address of the Orchestrator.</li> <li>▪ <code>site_id</code> The ID of the Maestro Site.</li> </ul>

Metric ID	Metric Description	Metric Type	Metric Units	Metric Labels	Metric Label Description

# Custom Metrics

## Overview

You can configure custom metrics and query them with OpenTelemetry.

This feature is available in:

- [R82](#) and higher
- [R81.20 Jumbo Hotfix Accumulator](#), Take 54 and higher
- [R81.10 Jumbo Hotfix Accumulator](#), Take 135 and higher
- [R81 Jumbo Hotfix Accumulator](#), Take 99 and higher

## Procedure

1. Connect to the command line on the Check Point server.
2. Log in to the Expert mode.
3. Create a shell script to configure the required objects for your custom metrics.

Create this script file in any directory.

Example: `/home/admin/script_with_custom_metrics.sh`

### Notes:

- You can use this script file as a template:

```
/opt/CPotlpAgent/custom_
scripts_template.bash
```

- To create a script file, run:

```
vi /path/to/your/script_
file
```

This shell script file must contain the lines described below.

### Part 1 (mandatory) - The call to the shell and to the required Check Point script

Syntax:

```
#!/bin/bash
. /opt/CPotlpAgent/cs_data_handler_is.bash
```

**Part 2 (mandatory) - Configure a custom metric object**

Syntax:

```
set_ot_object new value <Metric Value>
set_ot_object last label <Metric Label Key 1> <Metric Label Value 1>
set_ot_object last label <Metric Label Key 2> <Metric Label Value 2>
...
set_ot_object last label <Metric Label Key N> <Metric Label Value N>
```

Example:

```
set_ot_object new value 3.1
set_ot_object last label Client_IP 192.168.30.1
set_ot_object new value 4.0
set_ot_object last label Client_IP 192.168.30.2
set_ot_object last label Client_Type SecurityGateway
```

Result JSON array of custom metrics:

```
[
  {
    "value": 3.1,
    "labels": [
      {
        "Client_IP": "192.168.30.1"
      }
    ]
  },
  {
    "value": 4,
    "labels": [
      {
        "Client_IP": "192.168.30.2"
      },
      {
        "Client_Type": "SecurityGateway"
      }
    ]
  }
]
```

### Part 3 (optional) - Print verbose output

You can configure a desired log message that your shell script will save in the `/var/log/<script_name>.log` file.

Example:

- If the script file is: `/home/admin/script_with_custom_metrics.sh`
- Then the log file is: `/var/log/script_with_custom_metrics.log`

The line must start with the function name `"verbose_print"` and supports two parameters - a text string `"%s"` and an integer value `"%d"`.

Possible positional arguments:

```
verbose_print "%s %d" "<Desired Text Message>" <Desired Integer Value>
```

```
verbose_print "%d %s" <Desired Integer Value> "<Desired Text Message>"
```

Example:

```
verbose_print "My verbose message: %s ; My integer value: %d" "Script executed" 10
```

```
verbose_print "My integer value: %d ; My verbose message: %s" 10 "Script executed"
```

### Part 4 (mandatory) - Show an exit message and generate an exit code

Syntax:

```
script_exit "<Desired Exit Message>" <Integer Exit Code>
```

Configure one of these exit codes:

- 0 for success.
- 1 for input error or non-critical error.
- 2 for critical error.

Example:

```
script_exit "Finished running" 0
```

#### 4. Prepare the required payload in a JSON file for your custom metric.

Create this JSON file in any directory.

**Example:** /home/admin/payload\_with\_custom\_metrics.json

This JSON file must contain these lines (replace the placeholder strings "<...>" with your actual strings):

```
{
  "state" : "<State>",
  "command" : "<Command>",
  "desc" : "<Description>",
  "name" : "<Name>",
  "type" : "<Type>",
  "unit" : "<Unit>",
  "interval" : <Interval>
}
```

Where:

Parameter	Description
"state"	The state of the collector: <ul style="list-style-type: none"> <li>■ "enabled"</li> <li>■ "disabled"</li> </ul>
"command"	The command that the Skyline Agent needs to run to get the values and labels of the custom metric. The collected data will be in the JSON format - a batch of metric values (real value and label values).
"desc"	A description of this custom metric.
"name"	The name of the custom metric. Must be unique. Must contain only lowercase Latin letters (a-z). Use the period character "." as a separator between each name part. Example: system.cpu.util  <b>Best Practice</b> - For the metric convention name, refer to <a href="https://opentelemetry.io/docs/specs/semconv/general/metrics/">https://opentelemetry.io/docs/specs/semconv/general/metrics/</a>

Parameter	Description
"type"	<p>Can be one of these:</p> <ul style="list-style-type: none"> <li>■ "Counter" To count something by recording a delta value. <ul style="list-style-type: none"> <li>• If the value is monotonic, use "Counter".</li> <li>• Otherwise, use "UpDownCounter".</li> </ul> </li> <li>■ "UpDownCounter" To measure something by recording an absolute value that is additive / summable.</li> <li>■ "Gauge" To measure something by recording an absolute value that is <b>not</b> additive / summable.</li> </ul> <p>★ <b>Best Practice</b> - For the metric types, refer to <a href="https://uptrace.dev/opentelemetry/metrics.html">https://uptrace.dev/opentelemetry/metrics.html</a>.</p>
"unit"	<p>The measurement unit for the custom metric. For example, the unit for the metric "hardware.memory.util" is "bytes". If the custom metric uses a non-standard unit, you must enclose it in curly braces { }. For example: "{interval}".</p> <p>★ <b>Best Practice</b> - For the unit convention, refer to <a href="https://github.com/open-telemetry/semantic-conventions/blob/main/docs/general/metrics.md#instrument-units">https://github.com/open-telemetry/semantic-conventions/blob/main/docs/general/metrics.md#instrument-units</a>.</p>
"interval"	<p>How frequently (in seconds) the Skyline Agent needs to run the command.</p>

#### Example:

```
{
  "state" : "enabled",
  "command" : "cat /home/admin/HW_sensors_data.json",
  "desc" : "The current temperature in the appliance",
  "name" : "hardware.sensors.temperature",
  "type" : "Gauge",
  "unit" : "{celcius}",
  "interval" : 2
}
```

## 5. Run the configuration command to apply the JSON payload:

```
sklnctl otlp add -name /<Path>/<Shell Script File> --path  
/<Path>/<JSON File>
```

### Example:

```
sklnctl otlp add -name /home/admin/script_with_custom_  
metrics.sh --path /home/admin/payload_with_custom_metrics.json
```

## 6. Restart the OpenTelemetry Agent:

```
/opt/CPotlpAgent/CPotlpagentCli.sh stop
```

```
/opt/CPotlpAgent/CPotlpagentCli.sh start
```

## 7. Examine the currently exported metrics:

```
sklnctl otelcol metrics --show
```

# Notes

- During an upgrade, the Gaia OS automatically moves your shell script to this directory:

```
/var/log/CPotlpAgent/backup/scripts
```

- If there are issues with your custom metrics, then:

### 1. Restart the OpenTelemetry Agent:

```
/opt/CPotlpAgent/CPotlpagentCli.sh stop
```

```
/opt/CPotlpAgent/CPotlpagentCli.sh start
```

### 2. Examine these log files:

- /opt/CPotelcol/sklnctl.log
- /opt/CPotlpAgent/otlp\_agent.log
