# Important Information

## Latest Software

We recommend that you install the most recent software release to stay up-to-date with the latest functional improvements, stability fixes, security enhancements and protection against new and evolving attacks.

## Certifications

For third party independent certification of Check Point products, see the [Check Point Certifications page](#).

## Check Point R82.10

For more about this release, see the R82.10 [home page](#).

## Latest Version of this Document in English

# Introduction

The CLI Reference Guide provides CLI commands to configure and monitor Check Point Software Blades.

# Syntax Legend for CLI Commands

Whenever possible, this guide lists commands, parameters and options in the alphabetical order.

This guide uses this convention in the Command Line Interface (CLI) syntax:

| Character                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TAB                             | <p>Shows the available nested subcommands:</p> <pre>main command → nested subcommand 1 → → nested subsubcommand 1-1 → → nested subsubcommand 1-2 → nested subcommand 2</pre> <p>Example:</p> <pre>cpwd_admin   config     -a &lt;options&gt;     -d &lt;options&gt;     -p     -r   del &lt;options&gt;</pre> <p>Meaning, you can run only <b>one</b> of these commands:</p> <ul style="list-style-type: none"> <li>■ This command:             <pre>cpwd_admin config -a &lt;options&gt;</pre> </li> <li>■ Or this command:             <pre>cpwd_admin config -d &lt;options&gt;</pre> </li> <li>■ Or this command:             <pre>cpwd_admin config -p</pre> </li> <li>■ Or this command:             <pre>cpwd_admin config -r</pre> </li> <li>■ Or this command:             <pre>cpwd_admin del &lt;options&gt;</pre> </li> </ul> |
| Curly brackets or braces<br>{ } | <p>Enclose a list of available commands or parameters, separated by the vertical bar  .</p> <p>User can enter only one of the available commands or parameters.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Character                            | Description                                                            |
|--------------------------------------|------------------------------------------------------------------------|
| Angle brackets<br>< >                | Enclose a variable.<br>User must explicitly specify a supported value. |
| Square brackets or<br>brackets<br>[] | Enclose an optional command or parameter, which user can also enter.   |

# Gaia Commands

See:

- [\*R82.10 Gaia Administration Guide\*](#)
- [\*R82.10 Gaia Advanced Routing Administration Guide\*](#)

# Common Commands

## cpinfo

### Description

A utility that collects diagnostics data on your Check Point computer at the time of execution.

It is mandatory to collect these data when you contact [Check Point Support](#) about an issue on your Check Point server.

For more information, see [sk92739](#).

# cpview

## Overview of CPView

### Description

CPView is a text based built-in utility on a Check Point computer.

CPView Utility shows statistical data that contain both general system information (CPU, Memory, Disk space) and information for different Software Blades (only on a Security Gateway / ClusterXL / Scalable Platform Security Group).

The CPView continuously updates the data in easy to access views.

On a Security Gateway / ClusterXL / Scalable Platform Security Group, you can use this statistical data to monitor the performance.

For more information, see [sk101878](#).

### Syntax

```
cpview --help
```

## CPView User Interface

The CPView user interface has three sections:

| Section           | Description                                                                                                                                    |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Header</b>     | This view shows the time the statistics in the third view are collected. It updates when you refresh the statistics.                           |
| <b>Navigation</b> | This menu bar is interactive. Move between menus with the arrow keys and mouse.<br>A menu can have sub-menus and they show under the menu bar. |
| <b>View</b>       | This view shows the statistics collected in that view. These statistics update at the refresh rate.                                            |

## Using CPView

Use these keys to navigate the CPView:

| Key        | Description                                                                                                                 |
|------------|-----------------------------------------------------------------------------------------------------------------------------|
| Arrow keys | Moves between menus and views. Scrolls in a view.                                                                           |
| Home       | Returns to the <b>Overview</b> view.                                                                                        |
| Enter      | Changes to the <b>View Mode</b> .<br>On a menu with sub-menus, the <b>Enter</b> key moves you to the lowest level sub-menu. |
| Esc        | Returns to the <b>Menu Mode</b> .                                                                                           |
| Q          | Quits CPView.                                                                                                               |

Use these keys to change CPView interface options:

| Key | Description                                                                                          |
|-----|------------------------------------------------------------------------------------------------------|
| R   | Opens a window where you can change the refresh rate.<br>The default refresh rate is 2 seconds.      |
| W   | Changes between wide and normal display modes.<br>In wide mode, CPView fits the screen horizontally. |
| S   | Manually sets the number of rows or columns.                                                         |
| M   | Switches on/off the mouse.                                                                           |
| P   | Pauses and resumes the collection of statistics.                                                     |

Use these keys to save statistics, show help, and refresh statistics:

| Key       | Description                                                                                                                                         |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| C         | Saves the current page to a file. The file name format is:<br><code>cpview_&lt;ID of the cpview process&gt;.cap&lt;Number of the capture&gt;</code> |
| H         | Shows a tooltip with CPView options.                                                                                                                |
| Space bar | Immediately refreshes the statistics.                                                                                                               |

# hcp

## Description

HealthCheck Point (HCP) is a self-updatable suite of tools for:

- **Tests:** Assesses the health of your system.
- **WTS (What's The Story):** Provides a timeline of critical and informative events occurred on the system.
- **Topology:** Visualize the Firewall topology.

For more information, see [sk171436](#).

# Security Management Server Commands

For more information about Security Management Server, see the [\*R82.10 Security Management Administration Guide\*](#).

# Managing Security through API

This section describes the API Server on a Management Server and the applicable API Tools.

## API

You can configure and manage the Management Server through API Requests that you send to the API Server that runs on the Management Server.

The API Server can automate daily tasks and integrate Check Point solutions with 3rd-party systems, such as virtualization, ticketing, and change management systems.

To learn more about the management APIs, to see code samples, and to take advantage of user forums, see:

- The API Documentation:

- Online - [Check Point Management API Reference](#) (at the top, select the correct version)
- Local - `https://<IP Address of Management Server>/api_docs`

By default, access to the local API Documentation is disabled. Follow the instructions in [sk174606](#).

**Note** - On a Standalone server (a server which runs both a Security Management Server and a Security Gateway), the API Documentation web portal (`https://<IP Address of Management Server>/api_docs`) stops working when you open SmartView Web Application (`https://<IP Address of Management Server>/smartview`).

- The **Developers Network** section of [Check Point CheckMates Community](#).

## API Tools

You can run the required API commands on the Management Server in these ways:

- From the Command Line dialog in the SmartConsole GUI application (bottom left corner).
- From the command line on the Management Server with the "mgmt\_cli" command in the Expert mode.
- From the command line on the Management Server with the "mgmt" command in Gaia Clish.
- From the command line on the SmartConsole client host with the "mgmt\_cli.exe" tool (installed as part of SmartConsole for Windows OS).

# Configuring the API Server

To configure the API Server:

1. Connect with SmartConsole to the Security Management Server or applicable Domain Management Server.
2. From the left navigation panel, click **Manage & Settings**.
3. In the upper left section, click **Blades**.
4. In the **Management API** section, click **Advanced Settings**.

The **Management API Settings** window opens.

5. Configure the **Startup Settings** and the **Access Settings**.

## Configuring Startup Settings

Select **Automatic start** to automatically start the API server when you start or reboot the Management Server.

### Notes:

- If the Management Server has more than 4GB of RAM installed, the **Automatic start** option is activated by default during the Management Server installation.
- If the Management Server has less than 4GB of RAM, the **Automatic start** option is deactivated.

## Configuring Access Settings

Select one of these options to configure which clients can connect to the API Server:

- **Management server only**

Only the Management Server itself can connect to the API Server.

This option only lets you use the `mgmt_cli` utility on the Management Server command line to send API requests.

You cannot use SmartConsole or Web services to send API requests.

- **All IP addresses that can be used for GUI clients**

You can send API requests from all IP addresses that are defined in SmartConsole > **Permissions & Administrators** > **Trusted Clients**.

This includes requests from SmartConsole, Web services, and the `mgmt_cli` utility on the Management Server.

- **All IP addresses**

You can send API requests from all IP addresses.

This includes requests from SmartConsole, Web services, and the `mgmt_cli` utility on the Management Server.

6. Click **OK**.
7. In the upper left section, click **Permissions & Administrators**.
8. In the object of each applicable Administrator, make sure the assigned Permission Profile allows access to Management API.

### Instructions

- a. Edit the Administrator object.
- b. In the left panel, click **General**.
- c. In the **Permissions** section, on the right side of the selected Permission Profile, click the eye icon.  
  
The Permission Profile object opens in the read-only view.
- d. In the left panel, click **Management**.
- e. The permission **Management API Login** has to be selected.  
  
If it is not selected, then close this window and edit this Permission Profile object.
- f. Click **Close**.

9. Publish the SmartConsole session.
10. Restart the API Server on the Management Server with this command:

```
api restart
```

 **Notes:**

- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

- The output of this command must show:

```
API started successfully
```

11. Examine the status of the API server on the Management Server with this command:

```
api status
```

**Notes:**

- The output of this command must show:

```
-----
Overall API Status: Started
-----

API readiness test SUCCESSFUL. The server is up and ready
to receive connections
```

- The output of this command may show the state of the "API" process as "Stopped" when the API access is set to "All IP addresses that can be used for GUI clients", and more than 200 Trusted Clients are configured:

```
Processes:

Name          State      PID      More Information
-----
API           Stopped    ...
```

## Discarding API Sessions with Locks or Pending Changes

Open SmartConsole and API sessions that contain locks or unpublished changes are not automatically discarded. As a result, some sessions can remain open for extended periods.

The `ENABLE_DISCARD_WORKSESSIONS_OLDER_THAN_DAYS` environment variable controls whether stale open sessions are automatically discarded. By default, this variable is disabled, and open sessions with locks or unpublished changes remain available until they are manually discarded.

When enabled, the Security Management Server periodically evaluates open sessions and discards sessions that exceed the configured age threshold.

### To configure automatic discard of stale sessions:

1. Connect to the Security Management Server or Multi-Domain Server using SSH.
2. Switch to Expert mode.
3. To enable automatic discard of open sessions that contain locks or unpublished changes, set `ENABLE_DISCARD_WORKSESSIONS_OLDER_THAN_DAYS` to "true".

Run:

```
MDS_FWDIR/scripts/reload_env_vars.sh -e "ENABLE_DISCARD_
WORKSESSIONS_OLDER_THAN_DAYS=true"
```

```
$MDS_FWDIR/scripts/override_server_setting.sh -e ENABLE_DISCARD_
WORKSESSIONS_OLDER_THAN_DAYS true
```

4. By default, only sessions which are open for more than 60 days are automatically discarded. To configure the number of days after which sessions are discarded, run:

```
$MDS_FWDIR/scripts/reload_env_vars.sh -e "DISCARD_WORKSESSIONS_
OLDER_THAN_DAYS=<Number_of_Days>" $MDS_FWDIR/scripts/override_
server_setting.sh -e DISCARD_WORKSESSIONS_OLDER_THAN_DAYS
<Number_of_Days>
```

For example, to set the threshold to 30 days, run:

```
$MDS_FWDIR/scripts/reload_env_vars.sh -e "DISCARD_WORKSESSIONS_
OLDER_THAN_DAYS=30"
```

```
$MDS_FWDIR/scripts/override_server_setting.sh -e DISCARD_
WORKSESSIONS_OLDER_THAN_DAYS 30
```

### Result:

When `ENABLE_DISCARD_WORKSESSIONS_OLDER_THAN_DAYS` is set to "true":

- The Security Management Server checks all open SmartConsole and API sessions one time per day.
- If a session remains open longer than the number of days configured in `DISCARD_WORKSESSIONS_OLDER_THAN_DAYS`, the session is automatically discarded.

# contract\_util

## Description

Works with the Check Point Service Contracts.

For more information about Service Contract files, see [sk33089: What is a Service Contract File?](#)

## Syntax

```
contract_util [-d]
    check <options>
    cpmacro <options>
    download <options>
    mgmt
    print <options>
    summary <options>
    update <options>
    verify
```

## Parameters

| Parameter             | Description                                                                                                                                                                               |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| check<br><options>    | Checks whether the Security Gateway is eligible for an upgrade.<br>See <a href="#">"contract_util check" on page 50</a> .                                                                 |
| cpmacro<br><options>  | Overwrites the current <code>cp.macro</code> file with the specified <code>cp.macro</code> file.<br>See <a href="#">"contract_util cpmacro" on page 51</a> .                              |
| download<br><options> | Downloads all associated Check Point Service Contracts from the User Center, or from a local file.<br>See <a href="#">"contract_util download" on page 52</a> .                           |
| mgmt                  | Delivers the Service Contract information from the Management Server to the managed Security Gateways.<br>See <a href="#">"contract_util mgmt" on page 54</a> .                           |
| print<br><options>    | Shows all the installed licenses and whether the Service Contract covers these license, which entitles them for upgrade or not.<br>See <a href="#">"contract_util print" on page 55</a> . |

| Parameter            | Description                                                                                                                                                                                                   |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| summary<br><options> | Shows post-installation summary.<br>See " <a href="#">contract_util summary</a> " on page 56.                                                                                                                 |
| update<br><options>  | Updates Check Point Service Contracts from your User Center account.<br>See " <a href="#">contract_util update</a> " on page 57.                                                                              |
| verify               | Checks whether the Security Gateway is eligible for an upgrade.<br>This command also interprets the return values and shows a meaningful message.<br>See " <a href="#">contract_util verify</a> " on page 58. |

# contract\_util check

## Description

Checks whether the Security Gateway is eligible for an upgrade.

For more information about Service Contract files, see [sk33089: What is a Service Contract File?](#)

## Syntax

```
contract_util check
    {-h | -help}
    hfa
    maj_upgrade
    min_upgrade
    upgrade
```

## Parameters

| Parameter    | Description                                                                                    |
|--------------|------------------------------------------------------------------------------------------------|
| {-h   -help} | Shows the applicable built-in usage.                                                           |
| hfa          | Checks whether the Security Gateway is eligible for an upgrade to a higher Hotfix Accumulator. |
| maj_upgrade  | Checks whether the Security Gateway is eligible for an upgrade to a higher Major version.      |
| min_upgrade  | Checks whether the Security Gateway is eligible for an upgrade to a higher Minor version.      |
| upgrade      | Checks whether the Security Gateway is eligible for an upgrade.                                |

# contract\_util cpmacro

## Description

Overwrites the current `cp_macro` file with the specified `cp_macro` file, if the specified is newer than the current file.

For more information about the `cp_macro` file, see [sk96217: What is a cp\\_macro file?](#)

## Syntax

```
contract_util cpmacro /<path_to>/cp_macro
```

This command shows one of these messages:

| CntrctUtils_Write_cp_macro returned -1 | The <code>contract_util cpmacro</code> command failed: <ul style="list-style-type: none"><li>Failed to create a temporary file.</li><li>Failed to write to a temporary file.</li><li>Failed to replace the current file.</li></ul> |
| CntrctUtils_Write_cp_macro returned 0  | The <code>contract_util cpmacro</code> command was able to overwrite the current file with the specified file, because the specified file is newer.                                                                                |
| CntrctUtils_Write_cp_macro returned 1  | The <code>contract_util cpmacro</code> command did not overwrite the current file, because it is newer than the specified file.                                                                                                    |

# contract\_util download

## Description

Downloads all associated Check Point Service Contracts from User Center, or from a local file.

For more information about Service Contract files, see [sk33089: What is a Service Contract File?](#)

## Syntax

```
contract_util download
    {-h | -help}
    local
        {-h | -help}
        [{hfa | maj_upgrade | min_upgrade | upgrade}] <Service
Contract File>
    uc
        {-h | -help}
        [-i] [{hfa | maj_upgrade | min_upgrade | upgrade}]
<Username> <Password> [<Proxy Server> [<Proxy Username>:<Proxy
Password>]]
```

## Parameters

| Parameter                                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

# contract\_util mgmt

## Description

Delivers the Service Contract information from the Management Server to the managed Security Gateways.

For more information about Service Contract files, see [sk33089: What is a Service Contract File?](#)

## Syntax

```
contract_util mgmt
```

# contract\_util print

## Description

Shows all the installed licenses and whether the Service Contract covers these license, which entitles them for upgrade or not.

This command can show which licenses are not recognized by the Service Contract file.

For more information about Service Contract files, see [sk33089: What is a Service Contract File?](#)

## Syntax

```
contract_util [-d] print
               {-h | -help}
               hfa
               maj_upgrade
               min_upgrade
               upgrade
```

## Parameters

| Parameter    | Description                                          |
|--------------|------------------------------------------------------|
| {-h   -help} | Shows the applicable built-in usage.                 |
| -d           | Shows a formatted table header and more information. |
| hfa          | Shows the information about Hotfix Accumulator.      |
| maj_upgrade  | Shows the information about Major version.           |
| min_upgrade  | Shows the information about Minor version.           |
| upgrade      | Shows the information about an upgrade.              |

# contract\_util summary

## Description

Shows post-installation summary and whether this Check Point server is eligible for upgrades.

## Syntax

```
contract_util summary  
    hfa  
    maj_upgrade  
    min_upgrade  
    upgrade
```

## Parameters

| Parameter   | Description                                     |
|-------------|-------------------------------------------------|
| hfa         | Shows the information about Hotfix Accumulator. |
| maj_upgrade | Shows the information about Major version.      |
| min_upgrade | Shows the information about Minor version.      |
| upgrade     | Shows the information about an upgrade.         |

# contract\_util update

## Description

Updates the Check Point Service Contracts from your User Center account.

For more information about Service Contract files, see [sk33089: What is a Service Contract File?](#)

## Syntax

```
contract_util update
  [-proxy <Proxy Server>:<Proxy Port>]
  [-ca_path <Path to ca-bundle.crt File>]
```

## Parameters

| Parameter                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| update                                | Updates Check Point Service Contracts (attached to pre-installed licenses) from your User Center account.                                                                                                                                                                                                                                                                                                                  |
| -proxy <Proxy Server>:<Proxy Port>    | <p>Specifies that the connection to the User Center goes through the proxy server:</p> <ul style="list-style-type: none"><li>▪ &lt;Proxy Server&gt; - IP address of resolvable hostname of the proxy server.</li><li>▪ &lt;Proxy Port&gt; - The applicable port on the proxy server.</li></ul> <p>Note - If you do not specify the proxy explicitly, the command uses the proxy configured in the management database.</p> |
| -ca_path <Path to ca-bundle.crt File> | <p>Specifies the path to the Certificate Authority Bundle file (ca-bundle.crt).</p> <p> <b>Note</b> - If you do not specify the path explicitly, the command uses the default path.</p>                                                                                                                                                 |

# contract\_util verify

## Description

Checks whether the Security Gateway is eligible for an upgrade.

This command is the same as the "[contract\\_util check](#)" on page 50 command, but it also interprets the return values and shows a meaningful message.

For more information about Service Contract files, see [sk33089: What is a Service Contract File?](#)

## Syntax

```
contract_util verify
```

# cp\_conf

## Description

Configures or reconfigures a Check Point product installation.

 **Note** - The available options for each Check Point server depend on the configuration and installed products.

## Syntax on a Management Server

```
cp_conf
  -h
  admin <options>
  auto <options>
  ca <options>
  client <options>
  finger <options>
  lic <options>
  snmp <options>
```

## Syntax on a Security Gateway / each Cluster Member in Gaia Clish or the Expert mode

```
cp_conf
  -h
  adv_routing <options>
  auto <options>
  corexl <options>
  fullha <options>
  ha <options>
  intfs <options>
  lic <options>
  sic <options>
  snmp <options>
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cp_conf
  -h
  adv_routing <options>
  auto <options>
  corexl <options>
  fullha <options>
  ha <options>
  intfs <options>
  lic <options>
  sic <options>
  snmp <options>
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cp_conf
  -h
  adv_routing <options>
  auto <options>
  corexl <options>
  fullha <options>
  ha <options>
  intfs <options>
  lic <options>
  sic <options>
  snmp <options>
```

## Parameters

| Parameter                | Description                                                                                                                                                                                                                                                                                                                         |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -h                       | Shows the entire built-in usage.                                                                                                                                                                                                                                                                                                    |
| admin<br><options>       | Configures Check Point system administrators for the Security Management Server.<br>See <a href="#">"cp_conf admin" on page 63</a> .                                                                                                                                                                                                |
| adv_routing<br><options> | Enables or disables the Advanced Routing feature on this Security Gateway.<br> <b>Important</b> - Do not use these outdated commands. To configure Advanced Routing, see the <a href="#">R82.10 Gaia Advanced Routing Administration Guide</a> . |

| Parameter           | Description                                                                                                                                                                                                                                                            |

| sic<br><options>    | Manages SIC on this Security Gateway / Cluster Member / Security Group.<br>See <a href="#">"cp_conf sic" on page 1000</a> .                                                                                                                                            |

| Parameter         | Description                                                                                                                                                                          |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| snmp<br><options> | Do <b>not</b> use these outdated commands.<br>To configure SNMP, see the <a href="#">R82.10 Gaia Administration Guide</a> - Chapter <i>System Management</i> - Section <i>SNMP</i> . |

# cp\_conf admin

## Description

Configures Check Point system administrators for the Security Management Server.

### Notes:

- Multi-Domain Server does not support this command.
- Only one administrator can be defined in the *"cpconfig" on page 133* menu. To define additional administrators, use SmartConsole.
- This command corresponds to the option **Administrator** in the *"cpconfig" on page 133* menu.

## Syntax

```
cp_conf admin
  -h
  add [<UserName> <Password> {a | w | r}]
  add -gaia [{a | w | r}]
  del <UserName1> <UserName2> ...
  get
```

## Parameters

| Parameter                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -h                                         | Shows the applicable built-in usage.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Example 1 - Adding a Check Point system administrator

```
[Expert@MGMT:0]# cp_conf admin add
Administrator name: admin
Administrator admin already exists.
Do you want to change Administrator's Permissions (y/n) [n] ? y

Permissions for all products (Read/[W]rite All, [R]ead Only All, [C]ustomized) c
    Permission for SmartUpdate (Read/[W]rite, [R]ead Only, [N]one) w
    Permission for Monitoring (Read/[W]rite, [R]ead Only, [N]one) w

Administrator admin was modified successfully and has
Read/Write Permission for SmartUpdate
Read/Write Permission for Monitoring
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf admin get

The following Administrators
are defined for this Security Management Server:

admin (Read/Write Permission for all products; )
[Expert@MGMT:0]#
```

## Example 2 - Adding the Gaia administrator user

```
[Expert@MGMT:0]# cp_conf admin add -gaia
Permissions for all products (Read/[W]rite All, [R]ead Only All, [C]ustomized) c
    Permission for SmartUpdate (Read/[W]rite, [R]ead Only, [N]one) w
    Permission for Monitoring (Read/[W]rite, [R]ead Only, [N]one) w
Administrator admin was added successfully and has
Read/Write Permission for SmartUpdate
Read/Write Permission for Monitoring
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf admin get -gaia

The following Administrators
are defined for this Security Management Server:

admin (Read/Write Permission for all products; ) - Gaia admin
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf admin add -gaia a
Administrator admin already exists.

Administrator admin was modified successfully and has
Read/Write Permission for all products with Permission to Manage Administrators
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf admin add -gaia w
Administrator admin already exists.

Administrator admin was modified successfully and has
Read/Write Permission for all products without Permission to Manage Administrators
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf admin add -gaia r
Administrator admin already exists.

Administrator admin was modified successfully and has
Read Only Permission for all products
[Expert@MGMT:0]#
```

# cp\_conf auto

## Description

Shows and controls which of Check Point products start automatically during boot.

-  **Note** - This command corresponds to the option **Automatic start of Check Point Products** in the "[cpconfig](#)" on page 133 menu.
-  **Note** - On a Multi-Domain Server, use the option **Automatic Start of Multi-Domain Server** in the "[mdsconfig](#)" on page 763 menu.

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cp_conf auto
    -h
    {enable | disable} <Product1> <Product2> ...
    get all
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cp_conf auto
    -h
    {enable | disable} <Product1> <Product2> ...
    get all
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cp_conf auto
    -h
    {enable | disable} <Product1> <Product2> ...
    get all
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cp_conf auto
    -h
    {enable | disable} <Product1> <Product2> ...
    get all
```

## Parameters

| Parameter                                       | Description                                                                                                                                                                                                                 |
|-------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -h                                              | Shows the applicable built-in usage.                                                                                                                                                                                        |
| {enable   disable}<br><Product1> <Product2> ... | Controls whether the installed Check Point products start automatically during boot. This command is for Check Point use only.                                                                                              |
| get all                                         | Shows which of these Check Point products start automatically during boot: <ul style="list-style-type: none"> <li>■ Check Point Security Gateway</li> <li>■ QoS (former FloodGate-1)</li> <li>■ SmartEvent Suite</li> </ul> |

## Example from a Security Management Server

```
[Expert@MGMT:0]# cp_conf auto get all
Check Point Security Gateway is not installed

QoS is not installed

The SmartEvent Suite will start automatically at boot time.

[Expert@MGMT:0]#
```

## Example from a Security Gateway

```
[Expert@GW:0] cp_conf auto get all
The Check Point Security Gateway will start automatically at boot time.

QoS will start automatically at boot time.

SmartEvent Suite is not installed.

[Expert@GW:0]#
```

# cp\_conf ca

## Description

This command changes the settings of the Internal Certificate Authority (ICA).

 **Note** - On a Security Management Server, this command corresponds to the option **Certificate Authority** in the ["cpconfig" on page 133](#) menu.

 **Note:**  
On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsend <IP Address or Name of Domain Management Server>
```

## Syntax

```
cp_conf ca
    -h
    fqdn <FQDN Name>
    init
```

## Parameters

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -h               | Shows the applicable built-in usage.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| fqdn <FQDN Name> | <p>Configures the Fully Qualified Domain Name (FQDN) for the Internal Certificate Authority (ICA).</p> <p>The "&lt;FQDN Name&gt;" is the text string in this format:<br/><i>hostname.domainname</i></p> <p> <b>Notes:</b></p> <ul style="list-style-type: none"> <li>■ The existing certificates for configured objects are <b>not</b> revoked.</li> <li>■ The existing ICA certificate is <b>not</b> changed.</li> <li>■ The Management Server uses the specified "&lt;FQDN Name&gt;" to configure the Certificate Revocation List Distribution Point (CRL DP) property in all certificates that the ICA generates. Refer to this command: <a href="#">"cpca_client get_crl dp" on page 107</a></li> </ul> |
| init             | Initializes the Internal Certificate Authority (ICA).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Example

```
[Expert@MyMGMT:0]# hostname
MyMGMT
[Expert@MyMGMT:0]#

[Expert@MyMGMT:0]# domainname
checkpoint.com
[Expert@MyMGMT:0]#

[Expert@MyMGMT:0]# cp_conf ca fqdn MyMGMT.checkpoint.com
Trying to contact Certificate Authority. It might take a while...
Certificate was created successfully
MyMGMT.checkpoint.com was successfully set to the Internal CA
[Expert@MyMGMT:0]#
```

# cp\_conf client

## Description

Configures the GUI clients that are allowed to connect with SmartConsoles to the Security Management Server.

### Notes:

- Multi-Domain Server does not support this command.
- This command corresponds to the option **GUI Clients** in the "[cpconfig](#)" on [page 133](#) menu.

## Syntax

```
cp_conf client
  add <GUI Client>
  createlist <GUI Client 1> <GUI Client 2> ...
  del <GUI Client 1> <GUI Client 2> ...
  get
```

## Parameters

| Parameter                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| get                                             | Shows the allowed GUI clients.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Examples

### Example 1 - Configure one IPv4 address

```
[Expert@MGMT:0]# cp_conf client get
There are no GUI Clients defined for this Security Management Server
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client add 172.20.168.15
172.20.168.15 was successfully added.
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client get
172.20.168.15
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client del 172.20.168.15
172.20.168.15 was deleted successfully
[Expert@MGMT:0]#
```

## Example 2 - Configure one hostname

```
[Expert@MGMT:0]# cp_conf client get
There are no GUI Clients defined for this Security Management Server
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client add MySmartConsoleHost
MySmartConsoleHost was successfully added.
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client get
MySmartConsoleHost
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client del MySmartConsoleHost
MySmartConsoleHost was deleted successfully
[Expert@MGMT:0]#
```

## Example 3 - Configure "Any"

```
[Expert@MGMT:0]# cp_conf client get
There are no GUI Clients defined for this Security Management Server
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client add "Any"
Any was successfully added.
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client get
Any
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client del "Any"
Any was deleted successfully
[Expert@MGMT:0]#
```

## Example 4 - Configure a range of IPv4 addresses

```
[Expert@MGMT:0]# cp_conf client get
There are no GUI Clients defined for this Security Management Server
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client add 172.20.168.0/255.255.255.0
172.20.168.0/255.255.255.0 was successfully added.
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client get
172.20.168.0/255.255.255.0
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client del 172.20.168.0/255.255.255.0
172.20.168.0/255.255.255.0 was deleted successfully
[Expert@MGMT:0]#
```

### Example 5 - Configure IPv4 address wildcard

```
[Expert@MGMT:0]# cp_conf client get
There are no GUI Clients defined for this Security Management Server
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client add 172.20.168.*
172.20.168.* was successfully added.
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client get
172.20.168.*
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client del 172.20.168.*
172.20.168.* was deleted successfully
[Expert@MGMT:0]#
```

### Example 6 - Delete the current list and create a new list of allowed GUI clients

```
[Expert@MGMT:0]# cp_conf client get
There are no GUI Clients defined for this Security Management Server
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client add 172.20.168.0/255.255.255.0
172.20.168.0/255.255.255.0 was successfully added.
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client get
172.20.168.0/255.255.255.0
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client createlist 192.168.40.0/255.255.255.0 172.30.40.55
New list was created successfully
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client get
192.168.40.0/255.255.255.0
172.30.40.55
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client createlist "Any"
New list was created successfully
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client get
Any
[Expert@MGMT:0]#
```

# cp\_conf finger

## Description

Shows the Internal Certificate Authority's Fingerprint.

This fingerprint is a text string derived from the ICA certificate on the Security Management Server, Multi-Domain Server, or Domain Management Server.

This fingerprint verifies the identity of the Security Management Server, Multi-Domain Server, or Domain Management Server when you connect to it with SmartConsole.

 **Note** - This command corresponds to the option **Certificate's Fingerprint** in the *"cpconfig" on page 133* menu.

 **Note** - On a Multi-Domain Server:

- To see the fingerprint of the Multi-Domain Server, this command corresponds to the option **Certificate's Fingerprint** in the *"mdsconfig" on page 763* menu.
- You can run this command in these contexts:
  - To see the fingerprint of the Multi-Domain Server, run it in the context of the Multi-Domain Server:

```
mdsenv
```

- To see the fingerprint of a Domain Management Server, run it in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
cp_conf finger
    -h
    get
```

## Parameters

| Parameter | Description                          |
|-----------|--------------------------------------|
| -h        | Shows the applicable built-in usage. |
| get       | Shows the ICA's Fingerprint.         |

## Example

```
[Expert@MGMT:0]# cp_conf finger get  
EDNA COCO MOLE ATOM ASH MOT SAGE NINE ILL TINT HI CUBE  
[Expert@MGMT:0]#
```

## cp\_conf lic

### Description

Shows, adds and deletes Check Point licenses.

 **Note** - This command corresponds to the option **Licenses and contracts** in the *"cpconfig" on page 133* menu.

 **Note:**  
On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cp_conf lic
-h
add -f <Full Path to License File>
add -m <Host> <Date> <Signature Key> <SKU/Features>
del <Signature Key>
get [-x]
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cp_conf lic
-h
add -f <Full Path to License File>
add -m <Host> <Date> <Signature Key> <SKU/Features>
del <Signature Key>
get [-x]
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cp_conf lic
-h
add -f <Full Path to License File>
add -m <Host> <Date> <Signature Key> <SKU/Features>
del <Signature Key>
get [-x]
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cp_conf lic
-h
add -f <Full Path to License File>
add -m <Host> <Date> <Signature Key> <SKU/Features>
del <Signature Key>
get [-x]
```

## Parameters

| Parameter                                                 | Description                                                                                                                                                                                                                    |
|-----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -h                                                        | Shows the applicable built-in usage.                                                                                                                                                                                           |
| add -f <Full Path to License File>                        | <p>Adds a license from the specified Check Point license file.</p> <p>You get this license file in the <a href="#">Check Point User Center</a>.</p> <p>This is the same command as the <i>"cplic db_add" on page 143</i>.</p>  |
| add -m <Host> <Date><br><Signature Key><br><SKU/Features> | <p>Adds the license manually.</p> <p>You get these license details in the <a href="#">Check Point User Center</a>.</p> <p>This is the same command as the <i>"cplic db_add" on page 143</i>.</p>                               |
| del <Signature Key>                                       | <p>Delete the license based on its signature.</p> <p>This is the same command as the <i>"cplic del" on page 148</i>.</p>                                                                                                       |
| get [-x]                                                  | <p>Shows the local installed licenses.</p> <p>If you specify the "-x" parameter, output also shows the signature key for every installed license.</p> <p>This is the same command as the <i>"cplic print" on page 152</i>.</p> |

### Example 1 - Adding the license from the file

```
[Expert@HostName:0]# cp_conf lic add -f ~/License.lic
License was installed successfully.
[Expert@HostName:0]#

[Expert@HostName:0]# cp_conf lic get
Host          Expiration  Signature                                     Features
192.168.3.28   25Aug2019   xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx  CPMP-XXX
[Expert@HostName:0]#
```

## Example 2 - Adding the license manually

```
[Expert@MyHostName:0]# cp_conf lic add -m MyHostName 25Aug2019
xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx CPMP-XXX
License was successfully installed
[Expert@MyHostName:0]#

[Expert@MyHostName:0]# cp_conf lic get
Host          Expiration    Signature                                     Features
192.168.3.28   25Aug2019          xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx CPMP-XXX
[Expert@MyHostName:0]#
```

# cp\_log\_export

## Description

Exports Check Point logs over syslog.

For more information, see [sk122323](#) and [R82.10 Logging and Monitoring Administration Guide](#).

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsensv <IP Address or Name of Domain Management Server>
```

## Syntax

```
cp_log_export
```

```
cp_log_export <command-name> help
```

## Parameters

| Parameter           | Description                                              |
|---------------------|----------------------------------------------------------|
| No Parameters       | Shows the built-in general help.                         |
| <command-name> help | Shows the built help for the specified internal command. |

## Internal Commands

| Name     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| add      | <p><b>Configures a new Check Point Log Exporter.</b></p> <pre>cp_log_export add name &lt;Name&gt; target-server &lt;Target-Server&gt; target-port &lt;Target-Server-Port&gt; protocol {udp   tcp} [Optional Arguments]</pre>                                                                                                                                                                                                                    |

| target-server<br><Target-Server> | Specifies the IP address or FQDN of the target server, to which you export the logs.                                                       | <b>Mandatory</b>           | Optional                   | N / A                         | N / A                         | N / A                                                             | N / A                           |
| time-in-milli {true   false}     | Specifies whether to export logs with the time resolution in milliseconds.<br>Requires Security Gateways R81 and higher.<br>Default: false | Optional                   | Optional                   | N / A                         | N / A                         | N / A                                                             | N / A                           |

# cpca\_client

## Description

Execute operations on the Internal Certificate Authority (ICA).

 **Note:**  
On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

mdsenv <IP Address or Name of Domain Management Server>

## Syntax

```
cpca_client [-d]
  create_cert <options>
  double_sign <options>
  get_crldp <options>
  get_pubkey <options>
  init_certs <options>
  lscert <options>
  recreate_crls
  revoke_cert <options>
  revoke_non_exist_cert <options>
  search <options>
  set_ca_services <options>
  set_cert_validity <options>
  set_mgmt_tool <options>
  set_sign_hash <options>
```

## Parameters

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                               |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                    | <p>Runs the command in debug mode.</p> <p>Use only if you troubleshoot the command itself.</p> <p> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> |
| create_cert <options> | <p>Issues a SIC certificate for the Security Management Server or Domain Management Server.</p> <p>See "<a href="#">cpca_client create_cert</a>" on page 103.</p>                                                                                                                                                                                         |

| Parameter                                       | Description                                                                                                                                                                                                                            |
|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>double_sign</code><br><options>           | Creates a second signature for a certificate.<br>See <a href="#">"cpca_client double_sign" on page 105</a> .                                                                                                                           |
| <code>get_crl_dp</code><br><options>            | Shows how to access a CRL file from a CRL Distribution Point.<br>See <a href="#">"cpca_client get_crl_dp" on page 107</a> .                                                                                                            |
| <code>get_pubkey</code><br><options>            | Saves the encoding of the public key of the ICA's certificate to a file.<br>See <a href="#">"cpca_client get_pubkey" on page 109</a> .                                                                                                 |
| <code>init_certs</code><br><options>            | Imports a list of DN's for users and creates a file with registration keys for each user.<br>See <a href="#">"cpca_client init_certs" on page 110</a> .                                                                                |
| <code>ls-cert</code><br><options>               | Shows all certificates issued by the ICA.<br>See <a href="#">"cpca_client ls-cert" on page 111</a> .                                                                                                                                   |
| <code>recreate_crls</code>                      | Recreates all CRLs in the Internal CA database after you manually remove expired certificates from the Internal CA database as described in <a href="#">sk42424</a> .<br>See <a href="#">"cpca_client recreate_crls" on page 114</a> . |
| <code>revoke-cert</code><br><options>           | Revokes a certificate issued by the ICA.<br>See <a href="#">"cpca_client revoke-cert" on page 115</a> .                                                                                                                                |

# cpca\_client create\_cert

## Description

Issues a SIC certificate for the Security Management Server or Domain Management Server.

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
cpca_client [-d] create_cert [-p <CA port number>] -n "CN=<Common Name>" -f <Full Path to PKCS12 file> [-w <Password>] [-k {SIC | USER | IKE | ADMIN_PKG}] [-c "<Comment for Certificate>"] [-s <2048 | 3072 | 4096>]
```

## Parameters

| Parameter                         | Description                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                                | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| -p <CA port number>               | Specifies the TCP port on the Security Management Server or Domain Management Server, which is used to connect to the Certificate Authority.<br>The default TCP port number is 18209.                                                                                                                                                    |
| -n "CN=<Common Name>"             | Sets the CN to the specified <Common Name>.                                                                                                                                                                                                                                                                                              |
| -f <Full Path to PKCS12 file>     | Specifies the PKCS12 file, which stores the certificate and keys.                                                                                                                                                                                                                                                                        |
| -w <Password>                     | Optional. Specifies the certificate password.                                                                                                                                                                                                                                                                                            |
| -k {SIC   USER   IKE   ADMIN_PKG} | Optional. Specifies the certificate kind.                                                                                                                                                                                                                                                                                                |
| -c "<Comment for Certificate>"    | Optional. Specifies the certificate comment (must enclose in double quotes).                                                                                                                                                                                                                                                             |
| -s <2048   3072   4096>           | Optional. Specifies the length of the RSA key size in bits.                                                                                                                                                                                                                                                                              |

## Example

```
[Expert@MGMT:0]# cpca_client create_cert -n "cn=cp_mgmt" -f $CPDIR/conf/sic_cert.p12
```

# cpca\_client double\_sign

## Description

Creates a second signature for a certificate.

 **Note:**  
On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

mdsend <IP Address or Name of Domain Management Server>

## Syntax

```
cpca_client [-d] double_sign [-p <CA port number>] -i <Certificate File in PEM format> [-o <Full Path to Output File>]
```

## Parameters

| Parameter                           | Description                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                                  | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| -p <CA port number>                 | Optional. Specifies the TCP port on the Security Management Server or Domain Management Server, which is used to connect to the Certificate Authority.<br>The default TCP port number is 18209.                                                                                                                                            |
| -i <Certificate File in PEM format> | Imports the specified certificate (only in PEM format).                                                                                                                                                                                                                                                                                    |
| -o <Full Path to Output File>       | Optional. Saves the certificate into the specified file.                                                                                                                                                                                                                                                                                   |

## Example

```
[Expert@MGMT:0]# cpa_client double_sign -i certificate.pem

Requesting Double Signature for the following Certificate:
    refCount: 1
    Subject: Email=example@example.com,CN=http://www.example.com/,OU=ValiCert Class 2 Policy
Validation Authority,O=exampleO\, Inc.,L=ExampleL Validation Network

Double Sign of Cert:
=====
(
    : (
        :dn ("Email=example@example.com,CN=http://www.example.com/,OU=exampleOU Class 2
Policy Validation Authority,O=exampleO\, Inc.,L=exampleL Validation Network")
        :doubleSignCert (52016390... ..ebb67e96)
        :return_code (0)
    )
)

[Expert@MGMT:0]#
```

# cpca\_client get\_crl dp

## Description

Shows the Fully Qualified Domain Name (FQDN) configured for the Internal Certificate Authority (ICA) with the "[cp\\_conf ca](#)" on page 68" command.

The Management Server uses this FQDN:

1. To configure the Certificate Revocation List Distribution Point (CRL DP) property in all certificates that the ICA generates.
2. To create the URL for accessing the CRL.

Example: `http://MyMGMT.checkpoint.com:18264/ICA_CRL1.crl`

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsend <IP Address or Name of Domain Management Server>
```

## Syntax

```
cpca_client [-d] get_crl dp [-p <ICA port number>]
```

## Parameters

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                   | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| -p <ICA port number> | Optional.<br>Specifies the TCP port on the Security Management Server or Domain Management Server, which is used to connect to the Certificate Authority.<br>The default TCP port number is 18264.                                                                                                                                         |

## Example

```
[Expert@MyMGMT:0]# hostname
MyMGMT
[Expert@MyMGMT:0]#

[Expert@MyMGMT:0]# domainname
checkpoint.com
[Expert@MyMGMT:0]#

[Expert@MyMGMT:0]# cpa_client get_crldp
MyMGMT.checkpoint.com
[Expert@MyMGMT:0]
```

# cpca\_client get\_pubkey

## Description

Saves the encoding of the public key of the ICA's certificate to a file.

 **Note:**  
On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

mdsend <IP Address or Name of Domain Management Server>

## Syntax

```
cpca_client [-d] get_pubkey [-p <CA port number>] <Full Path to Output File>
```

## Parameters

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                         | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| -p <CA port number>        | Specifies the TCP port on the Security Management Server or Domain Management Server, which is used to connect to the Certificate Authority.<br>The default TCP port number is 18209.                                                                                                                                                      |
| <Full Path to Output File> | Saves the encoding of the public key of the ICA's certificate to the specified file.                                                                                                                                                                                                                                                       |

## Example

```
[Expert@MGMT:0]# cpcal_client get_pubkey /tmp/key.txt[Expert@MGMT:0]#  
[Expert@MGMT:0]# cat /tmp/key.txt  
3082010a... ..f98b8910  
[Expert@MGMT:0]#
```

# cpca\_client init\_certs

## Description

Imports a list of Distinguished Names (DN) for users and creates a file with registration keys for each user.

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
cpca_client [-d] init_certs [-p <CA port number>] -i <Full Path to Input File> -o <Full Path to Output File>
```

## Parameters

| Parameter                     | Description                                                                                                                                                                                                                                                          |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                            | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> |
| -p <CA port number>           | <p>Optional. Specifies the TCP port on the Security Management Server or Domain Management Server, which is used to connect to the Certificate Authority.<br/>The default TCP port number is 18209.</p>                                                              |
| -i <Full Path to Input File>  | <p>Imports the specified file.<br/>Make sure to use the full path.<br/>Make sure that there is an empty line between each DN in the specified file.<br/>Example:</p> <pre>...CN=test1,OU=users... &amp;ltltEmpty Line&gt; ...CN=test2,OU=users...</pre>              |
| -o <Full Path to Output File> | <p>Saves the registration keys to the specified file.<br/>This command saves the error messages in the &lt;Name of Output File&gt;.failures file in the same directory.</p>                                                                                          |

# cpca\_client lscert

## Description

Shows all certificates issued by the ICA.

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
cpca_client [-d] lscert [-dn <SubString>] [-stat {Pending | Valid  
| Revoked | Expired | Renewed}] [-kind {SIC | IKE | User | LDAP}]  
[-ser <Certificate Serial Number>] [-dp <Certificate Distribution  
Point>]
```

## Parameters

| Parameter                                                          | Description                                                                                                                                                                                                                                                          |
|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-d</code>                                                    | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> |
| <code>-dn &lt;SubString&gt;</code>                                 | <p>Optional. Filters the search results to those with a DN that matches the specified <i>&lt;SubString&gt;</i>.<br/>This command does not support multiple values.</p>                                                                                               |
| <code>-stat {Pending   Valid   Revoked   Expired   Renewed}</code> | <p>Optional. Filters the search results to those with certificate status that matches the specified status.<br/>This command does not support multiple values.</p>                                                                                                   |
| <code>-kind {SIC   IKE   User   LDAP}</code>                       | <p>Optional. Filters the search results to those with certificate kind that matches the specified kind.<br/>This command does not support multiple values.</p>                                                                                                       |
| <code>-ser &lt;Certificate Serial Number&gt;</code>                | <p>Optional. Filters the search results to those with certificate serial number that matches the specified serial number.<br/>This command does not support multiple values.</p>                                                                                     |
| <code>-dp &lt;Certificate Distribution Point&gt;</code>            | <p>Optional. Filters the search results to the specified Certificate Distribution Point (CDP).<br/>This command does not support multiple values.</p>                                                                                                                |

## Example

```
[Expert@MGMT:0]# cpa_client lscert -stat Revoked
Operation succeeded. rc=0.
5 certs found.

[Expert@MGMT:0]#
```

# cpca\_client recreate\_crls

## Description

Recreates all CRLs in the Internal CA database after you manually remove expired certificates from the Internal CA database as described in [sk42424](#).

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
cpca_client [-d] recreate_crls
```

## Parameters

| Parameter     | Description                                                                                                                                                                                                                                            |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d            | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br><b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| recreate_crls | Recreates all CRLs in the Internal CA database.                                                                                                                                                                                                        |

## Example

```
[Expert@MGMT:0]# cpcal_client recreate_crls

About to ask the Internal CA to recreate all CRLs.

Recreating the Internal CA CRLs finished successfully.

[Expert@MGMT:0]#
```

# cpca\_client revoke\_cert

## Description

Revokes a certificate issued by the ICA.

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
cpca_client [-d] revoke_cert [-p <CA port number>] -n "CN=<Common Name>" -s <Certificate Serial Number>
```

## Parameters

| Parameter                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                                | <p>Runs the command in debug mode.</p> <p>Use only if you troubleshoot the command itself.</p> <p>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p>                                                                                                                                                                                                                                                                                                                                                                  |
| -p <CA port number>               | <p>Optional. Specifies the TCP port on the Security Management Server or Domain Management Server, which is used to connect to the Certificate Authority.</p> <p>The default TCP port number is 18209.</p>                                                                                                                                                                                                                                                                                                                                                                                                                               |
| -n<br>"CN=<Common Name>"          | <p>Specifies the certificate CN.</p> <p>To get the CN, run the <a href="#">"cpca_client lscert" on page 111</a> command and examine the text that you see between the "Subject =" and the ", O=...".</p> <p><b>Example</b></p> <p>From this output:</p> <pre>Subject = CN=VS1 VPN Certificate,O=MyDomain_Server.checkpoint.com.s6t98x Status = Valid Kind = IKE Serial = 27214 DP = 1 Not_Before: Wed Apr 11 17:26:02 2018 Not_After: Tue Apr 11 17:26:02 2023</pre> <p>you get this syntax:</p> <pre>-n "CN=VS1 VPN Certificate"</pre> <p>📘 <b>Note</b> - You can use the parameter '-n' only, or together with the parameter "-s".</p> |
| -s<br><Certificate Serial Number> | <p>Specifies the certificate serial number.</p> <p>To see the serial number, run the <a href="#">"cpca_client lscert" on page 111</a> command.</p> <p>📘 <b>Note</b> - You can use the parameter "-s" only, or together with the parameter "-n".</p>                                                                                                                                                                                                                                                                                                                                                                                      |

## Example 1 - Revoking a certificate specified by its CN

```
[Expert@MGMT:0]# cpca_client lscert
Subject = CN=VS1 VPN Certificate,O=MyDomain_Server.checkpoint.com.s6t98x
Status = Valid Kind = IKE Serial = 27214 DP = 1
Not_Before: Wed Apr 11 17:26:02 2018 Not_After: Tue Apr 11 17:26:02 2023
[Expert@MGMT:0]#
[Expert@MGMT:0]# cpca_client -d revoke_cert -n "CN=VS1 VPN Certificate"
Certificate was revoked successfully
[Expert@MGMT:0]#
```

## Example 2 - Revoking a certificate specified by its serial number.

```
[Expert@MGMT:0]# cpa_client lscert
Subject = CN=VS1 VPN Certificate,O=MyDomain_Server.checkpoint.com.s6t98x
Status = Valid Kind = IKE Serial = 27214 DP = 1
Not_Before: Wed Apr 11 17:26:02 2018 Not_After: Tue Apr 11 17:26:02 2023
[Expert@MGMT:0]#
[Expert@MGMT:0]# cpa_client -d revoke_cert -s 27214
Certificate was revoked successfully
[Expert@MGMT:0]#
```

# cpca\_client revoke\_non\_exist\_cert

## Description

Revokes a non-existent certificate issued by the ICA.

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsend <IP Address or Name of Domain Management Server>
```

## Syntax

```
cpca_client [-d] revoke_non_exist_cert -i <Full Path to Input File>
```

## Parameters

| Parameter                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                              | Runs the <code>cpca_client</code> command under debug.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| -i<br><Full Path to Input File> | <p>Specifies the file that contains the list of the certificate to revoke. **Note** - This command saves the error messages in the `<Name of Input File>.failures` file.

# cpca\_client search

## Description

Searches for certificates in the ICA.

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
cpca_client [-d] search <String> [-where {dn | comment | serial |  
device_type | device_id | device_name}] [-kind {SIC | IKE | User |  
LDAP}] [-stat {Pending | Valid | Revoked | Expired | Renewed}] [-  
max <Maximum Number of Results>] [-showfp {y | n}]
```

## Parameters

| Parameter | Description                                                                                                                                                                                                                                                  |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d        | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br><br>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| <String>  | Specifies the text to search in the certificates.<br>You can enter only one text string that does not contain spaces.                                                                                                                                        |

| Parameter                                                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

[Expert@MGMT:0]#
```

## cpca\_client set\_ca\_services

### Description

This command enables and disables the Certificate Authority Services Portal on the Management Server on the TCP port 18268.

From this portal, you can download the applicable Internal Certificate Authority certificates.

For trust purposes, you can install this certificate on the applicable Security Gateways, externally managed Site to Site VPN peer gateways, Remote Access VPN clients, clients that use Clientless VPN, and so on.

**Note** - In R82.10, the TCP port 18264 on the Management Server is available only for the retrieval of the CRL (Certificate Revocation List).

### Syntax

```
cpca_client set_ca_services {on | off}
```

### Parameters

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| on        | Enables the Certificate Authority Services Portal  |
| off       | Disables the Certificate Authority Services Portal |

### Procedure for a Security Management Server

#### Enabling the Certificate Authority Services Portal

1. Connect to the command line on the Security Management Server.
2. Log in to the Expert mode.
3. Enable the Certificate Authority Services Portal:

```
cpca_client set_ca_services on
```

4. With a web browser, connect to:

```
http://<IP Address of Security Management Server>:18268
```

5. Download the required certificate.
6. Install this certificate on the applicable computers.

## Disabling the Certificate Authority Services Portal

1. Connect to the command line on the Security Management Server.
2. Log in to the Expert mode.
3. Disable the Certificate Authority Services Portal:

```
cpca_client set_ca_services off
```

## Procedure for a Domain Management Server

### Enabling the Certificate Authority Services Portal

1. Connect to the command line on the Multi-Domain Server.
2. Log in to the Expert mode.
3. Go to the context of the Domain Management Server:

```
mdsensv <IP Address or Name of Domain Management Server>
```

4. Enable the Certificate Authority Services Portal:

```
cpca_client set_ca_services on
```

5. With a web browser, connect to:

```
http://<IP Address of Domain Management Server>:18268
```

6. Download the required certificate.
7. Install this certificate on the applicable computers.

### Disabling the Certificate Authority Services Portal

1. Connect to the command line on the Multi-Domain Server.
2. Log in to the Expert mode.
3. Go to the context of the Domain Management Server:

```
mdsensv <IP Address or Name of Domain Management Server>
```

4. Disable the Certificate Authority Services Portal:

```
cpca_client set_ca_services off
```

# cpca\_client set\_cert\_validity

## Description

This command configures the default certificate validity period for new certificates.

### Notes:

- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

- The new certificate validity period applies only to certificate you create after this change.

## Syntax

```
cpca_client set_cert_validity -k {SIC | IKE | USER} [-y <Number of Years>] [-d <Number of Days>] [-h <Number of Hours>] [-s <Number of Seconds>]
```

## Parameters

| Parameter              | Description                               |
|------------------------|-------------------------------------------|
| -k {SIC   IKE   USER}  | Specifies the certificate type.           |
| -y <Number of Years>   | Specifies the validity period in years.   |
| -d <Number of Days>    | Specifies the validity period in days.    |
| -h <Number of Hours>   | Specifies the validity period in hours.   |
| -s <Number of Seconds> | Specifies the validity period in seconds. |

## Example

```
[Expert@MGMT:0]# cpcal_client set_cert_validity -k IKE -y 3
cert validity period was changed successfully.
[Expert@MGMT:0]#
```

# cpca\_client set\_mgmt\_tool

## Description

Controls the ICA Management Tool.

This tool is disabled by default.

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

See [sk102837: Best Practices - ICA Management Tool configuration](#)

## Syntax

```
cpca_client [-d] set_mgmt_tool {on | off | add | remove | clean | print} [-p <CA port number>] [{-a <Administrator DN> | -u <User DN> | -c <Custom User DN>}]
```

## Parameters

| Parameter | Description                                                                                                                                                                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d        | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br><b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| on        | Starts the ICA Management Tool.                                                                                                                                                                                                                        |
| off       | Stops the ICA Management Tool.                                                                                                                                                                                                                         |
| add       | Adds the specified administrator, user, or custom user that is permitted to use the ICA Management Tool.                                                                                                                                               |
| remove    | Removes the specified administrator, user, or custom user that is permitted to use the ICA Management Tool.                                                                                                                                            |
| clean     | Removes all administrators, users, or custom users that are permitted to use the ICA Management Tool.                                                                                                                                                  |
| print     | Shows the configured administrators, users, or custom users that are permitted to use the ICA Management Tool.                                                                                                                                         |

| Parameter                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-p &lt;CA port number&gt;</code>   | <p>Optional. Specifies the TCP port on the Security Management Server or Domain Management Server, which is used to connect to the Certificate Authority.</p> <p>The default TCP port number is 18265.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Parameter                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-c &lt;Custom User DN&gt;</code> | <p>Optional. Specifies the DN for the custom user that is permitted to use the ICA Management Tool.<br/>Must specify the full DN as appears in SmartConsole.</p> <p><b>Procedure</b></p> <ol style="list-style-type: none"> <li>1. Open <b>Object Explorer &gt; Users</b></li> <li>2. Open the Administrator object or a User object properties</li> <li>3. Click the <b>Certificates</b> pane</li> <li>4. Select the certificate and click the pencil icon</li> <li>5. Click <b>View certificate details</b></li> <li>6. In the <b>Certificate Info</b> window, click the <b>Details</b> tab</li> <li>7. Click the <b>Subject</b> field</li> <li>8. Concatenate all fields</li> </ol> <p><b>Example:</b></p> <pre>-c "CN=ICA_Tool_User,OU=users,O=MGMT.s6t98x"</pre> |

-  **Note** - If you run the "cpca\_client set\_mgmt\_tool" command without the parameter "-a" or "-u", the list of the permitted administrators and users is not changed. The previously defined permitted administrators and users can start and stop the ICA Management Tool.

## To connect to the ICA Management Tool

1. In SmartConsole, configure the required administrator and user objects.

You must create a certificate for these administrators and users.

You use this certificate to configure the permitted users in the ICA Management Tool and in the client web browsers.

2. In the command line on the Management Server, add the required administrators and users that are permitted to use the ICA Management Tool.

```
cpca_client set_mgmt_tool add ...
```

3. In the command line on the Management Server, start the ICA Management Tool.

```
cpca_client set_mgmt_tool on
```

4. Check the status of the ICA Management Tool:

```
cpca_client set_mgmt_tool print
```

5. Import the administrator's / user's certificate into the Windows Certificate Store:.

- a. Right-click the \*.p12 file you saved when you created the required administrator / user, and click **Install PFX**.

The **Certificate Import Wizard** opens.

- b. In the **Store Location** section, select the applicable option:

- **Current User** (this is the default)
- **Local Machine**

- c. Click **Next**.

- d. Enter the same certificate password you used when you created the required administrator / user certificate.

- e. Clear **Enable strong private key protection**.

- f. Select **Mark this key as exportable**.

- g. Click **Next**.

- h. Select **Place all certificates in the following store** > click **Browse** > select **Personal** > click **OK**.

- i. Click **Next**.

- j. Click **Finish**.

6. In a web browser, connect to the ICA Management Tool:

```
https://<IP Address of the Management Server>:18265
```

 **Important** - The fact that the TCP port 18265 is open is not a vulnerability. The ICA Management Tool Portal is secured and protected by SSL. In addition, only authorized administrators and users are allowed to access it using a certificate.

7. A dialog box with this message appears:

```
Client Authentication
```

```
Identification
```

```
The Web site you want to view requests identification.
```

```
Select the certificate to use when connecting.
```

8. Select the appropriate certificate for authenticating to the ICA Management Tool.
9. Click **OK**.
10. In the **Security Alert** dialog box, click **Yes**.

# cpca\_client set\_sign\_hash

## Description

Sets the hash algorithm that the CA uses to sign the file hash. Also, see [sk103840](#).

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsend <IP Address or Name of Domain Management Server>
```

## Syntax

```
cpca_client [-d] set_sign_hash {sha1 | sha256 | sha384 | sha512}
```

**Important** - After this change, you must restart the Check Point services with these commands:

- On Security Management Server, run:
  1. cpstop
  2. cpstart
- On a Multi-Domain Server, run:
  1. mdsstop\_customer <Name or IP Address of Domain Management Server>
  2. mdsstart\_customer <Name or IP Address of Domain Management Server>

## Parameters

| Parameter                         | Description                                                                                                                                                                                                                                              |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                                | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| {sha1   sha256   sha384   sha512} | The hash algorithms that the CA uses to sign the file hash.<br>The default algorithm is SHA-256.                                                                                                                                                         |

## Example

```
[Expert@MGMT:0]# cpc_client set_sign_hash sha256

You have selected the signature hash function SHA-256
WARNING: This hash algorithm is not supported in Check Point gateways prior to R71.
WARNING: It is also not supported on older clients and SG80 R71.

Are you sure? (y/n)
y
Internal CA signature hash changed successfully.
Note that the signature on the Internal CA certificate has not changed, but this has no security
implications.
[Expert@MGMT:0]#
[Expert@MGMT:0]# cpstop ; cpstart
```

# cpca\_create

## Description

Creates new Check Point Internal Certificate Authority database.

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
cpca_create [-d] -dn <CA DN>
```

## Parameters

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d          | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| -dn <CA DN> | Specifies the Certificate Authority Distinguished Name (DN).                                                                                                                                                                                                                                                                               |

# cpconfig

## Description

This command starts the Check Point Configuration Tool.

This utility configures specific settings for the installed Check Point products.

## Syntax

```
cpconfig
```

**Note** - On a Multi-Domain Server, run the *"mdsconfig" on page 763* command.

## Menu Options

**Note** - The options shown depend on the configuration and installed products.

| Menu Option                                    | Description                                                                                                                                                                                                    |
|------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Licenses and contracts</b>                  | Manages Check Point licenses and contracts on this server.                                                                                                                                                     |
| <b>Administrator</b>                           | Configures Check Point system administrators for this server.                                                                                                                                                  |
| <b>GUI Clients</b>                             | Configures the GUI clients that can use SmartConsole to connect to this server.                                                                                                                                |
| <b>SNMP Extension</b>                          | Obsolete. Do <b>not</b> use this option anymore.<br>To configure SNMP, see the <a href="#">R82.10 Gaia Administration Guide</a> - Chapter <i>System Management</i> - Section <i>SNMP</i> .                     |
| <b>Random Pool</b>                             | Configures the RSA keys, to be used by Gaia Operating System.                                                                                                                                                  |
| <b>Certificate Authority</b>                   | Initializes the Internal Certificate Authority (ICA) and configures the Certificate Authority's (CA) Fully Qualified Domain Name (FQDN).                                                                       |
| <b>Certificate's Fingerprint</b>               | Shows the ICA's Fingerprint.<br>This fingerprint is a text string derived from the server's ICA certificate.<br>This fingerprint verifies the identity of the server when you connect to it with SmartConsole. |
| <b>Automatic start of Check Point Products</b> | Shows and controls which of the installed Check Point products start automatically during boot.                                                                                                                |
| <b>Exit</b>                                    | Exits from the Check Point Configuration Tool.                                                                                                                                                                 |

## Example - Menu on a Security Management Server

```
[Expert@MyMGMT:0]# cpconfig
This program will let you re-configure
your Check Point Security Management Server configuration.
```

```
Configuration Options:
```

```
-----
```

- (1) Licenses and contracts
- (2) Administrator
- (3) GUI Clients
- (4) SNMP Extension
- (5) Random Pool
- (6) Certificate Authority
- (7) Certificate's Fingerprint
- (8) Automatic start of Check Point Products

(9) Exit

```
Enter your choice (1-9) :
```

# cplic

## Description

The `cplic` command manages Check Point licenses.

You can run this command in Gaia Clish or in the Expert mode.

License Management is divided into three types of commands:

| Licensing Commands          | Applies To                                                | Description                                                                                                                                                            |
|-----------------------------|-----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Local licensing commands    | Management Servers, Security Gateways and Cluster Members | You execute these commands locally on the Check Point servers.                                                                                                         |
| Remote licensing commands   | Management Servers only                                   | You execute these commands on the Security Management Server or Domain Management Server.<br>These changes affect the managed Security Gateways and Cluster Members.   |
| License Repository commands | Management Servers only                                   | You execute these commands on the Security Management Server or Domain Management Server.<br>These changes affect the licenses stored in the local license repository. |

For more about managing licenses, see the [R82.10 Security Management Administration Guide](#).

## Syntax for Local Licensing on a Management Server itself

```
cplic [-d]
      {-h | -help}
      check <options>
      contract <options>
      del <options>
      print <options>
      put <options>
```

## Syntax for Remote Licensing on managed Security Gateways and Cluster Members

```
cplic [-d]
      {-h | -help}
      del <options>
      get <options>
      put <options>
      upgrade <options>
```

## Syntax for License Database Operations on a Management Server

```
cplic [-d]
      {-h | -help}
      db_add <options>
      db_print <options>
      db_rm <options>
```

## Parameters

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                    | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |

# cplic check

## Description

Confirms that the license includes the feature on the local Security Gateway or Management Server. See [sk66245](#).

## Syntax

```
cplic check {-h | -help}
```

```
cplic [-d] check [-p <Product>] [-v <Version>] [{-c | -count}] [-t  
<Date>] [{-r | -routers}] [{-S | -SRusers}] <Feature>
```

You can run this command:

- On a Management Server / Security Gateway / Cluster Member in Gaia Clish or the Expert mode
- On a Scalable Platform Security Group in Gaia gClish or the Expert mode

## Parameters

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

[Expert@GW]#
[Expert@GW]# cplic check -c cluster-u
cplic check 'cluster-u': 9 licenses
[Expert@GW]#
```

# cplic contract

## Description

Deletes the Check Point Service Contract on the local Check Point server.

Installs the Check Point Service Contract on the local Check Point server.

### Note

- For more information about Service Contract files, see [sk33089: What is a Service Contract File?](#)
- If you install a Service Contract on a managed Security Gateway / Cluster Member / Scalable Platform Security Group, you must update the license repository on the applicable Management Server - either with the "*cplic get*" on [page 150](#) command, or in SmartUpdate.

## Syntax

```
cplic contract -h

cplic [-d] contract
      del
          -h
          <Service Contract ID>

      put
          -h
          [{-o | -overwrite}] <Service Contract File>
```

You can run this command:

- On a Management Server / Security Gateway / Cluster Member in Gaia Clish or the Expert mode
- On a Scalable Platform Security Group in Gaia gClish or the Expert mode

## Parameters

| Parameter                                  | Description                                                                                                                                                                                                                                                          |
|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <code>-d</code>                            | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> |
| <code>del</code>                           | Deletes the Service Contract from the <code>\$CPDIR/conf/cp.contract</code> file on the local Check Point server.                                                                                                                                                    |
| <code>put</code>                           | Merges the Service Contract to the <code>\$CPDIR/conf/cp.contract</code> file on the local Check Point server.                                                                                                                                                       |
| <code>&lt;Service Contract ID&gt;</code>   | ID of the Service Contract.                                                                                                                                                                                                                                          |
| <code>{-o   -overwrite}</code>             | Specifies to overwrite the current Service Contract.                                                                                                                                                                                                                 |
| <code>&lt;Service Contract File&gt;</code> | <p>Path to and the name of the Service Contract file.<br/>First, you must download the Service Contract file from your <a href="#">Check Point User Center</a> account.</p>                                                                                          |

# cplic db\_add

## Description

Adds licenses to the license repository on the Management Server.

When you add Local licenses to the license repository, Management Server automatically attaches them to the managed Security Gateway / Cluster Member with the matching IP address.

When you add Central licenses, you must manually attach them.

**Note** - You get the license details in the [Check Point User Center](#).

## Syntax

```
cplic db_add {-h | -help}
```

```
cplic [-d] db_add -l <License File> [<Host>] [<Expiration Date>]  
[<Signature>] [<SKU/Features>]
```

## Parameters

| Parameter         | Description                                                                                                                                                                                                                                            |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {-h   -help}      | Shows the applicable built-in usage.                                                                                                                                                                                                                   |
| -d                | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br><b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| -l <License File> | Name of the file that contains the license.                                                                                                                                                                                                            |
| <Host>            | Hostname or IP address of the Security Management Server / Domain Management Server.                                                                                                                                                                   |
| <Expiration Date> | The license expiration date.                                                                                                                                                                                                                           |
| <Signature>       | The license signature string.<br>For example: aa6uwknDc-CE6CRtjhv-zipoVWSnm-z98N7Ck3m<br>Case sensitive. Hyphens are optional.                                                                                                                         |

| Parameter                         | Description                                                                                                   |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>&lt;SKU/Features&gt;</code> | The SKU of the license summarizes the features included in the license.<br>For example, CPSUITE-EVAL-3DES-vNG |

## Example

If the file `192.0.2.11.lic` contains one or more licenses, the command "`cplic db_add -l 192.0.2.11.lic`" produces output similar to:

```
[Expert@MGMT]# cplic db_add -l 192.0.2.11.lic
Adding license to database ...
Operation Done
[Expert@MGMT]#
```

# cplic db\_print

## Description

Shows the details of Check Point licenses stored in the license repository on the Management Server.

## Syntax

```
cplic db_print {-h | -help}
```

```
cplic [-d] db_print {<Object Name> | -all} [{-n | -noheader}] [-x]
[{-t | -type}] [{-a | -attached}]
```

## Parameters

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {-h   -help}     | Shows the applicable built-in usage.                                                                                                                                                                                                                                                                                                       |
| -d               | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| <Object Name>    | Prints only the licenses attached to <Object Name>.<br><Object Name> is the name of the Security Gateway / Cluster Member object as defined in SmartConsole.                                                                                                                                                                               |
| -all             | Prints all the licenses in the license repository.                                                                                                                                                                                                                                                                                         |
| {-n   -noheader} | Prints licenses with no header.                                                                                                                                                                                                                                                                                                            |
| -x               | Prints licenses with their signatures.                                                                                                                                                                                                                                                                                                     |
| {-t   -type}     | Prints licenses with their type: Central or Local.                                                                                                                                                                                                                                                                                         |
| {-a   -attached} | Shows to which object the license is attached.<br>Useful, if the parameter "-all" is specified.                                                                                                                                                                                                                                            |

## Example

```
[Expert@MGMT:0]# cplic db_print -all
Retrieving license information from database ...

The following licenses appear in the database:
=====
Host          Expiration Features
192.168.3.28   25Aug2019  xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx CPMP-XXX  CK-XXXXXXXXXXXXX
[Expert@MGMT:0]#

[Expert@MGMT:0]# cplic db_print -all -x -a
Retrieving license information from database ...

The following licenses appear in the database:
=====
Host          Expiration Features
192.168.3.28   25Aug2019  xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx CPMP-XXX  CK-XXXXXXXXXXXXX  MGMT
[Expert@MGMT:0]#
```

# cplic db\_rm

## Description

Removes a license from the license repository on the Management Server.

After you remove the license from the repository, it can no longer use it.

 **Warning** - You can run this command **ONLY** after you detach the license with the *"cplic del" on page 148* command.

## Syntax

```
cplic db_rm {-h | -help}
```

```
cplic [-d] db_rm <Signature>
```

## Parameters

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {-h   -help} | Shows the applicable built-in usage.                                                                                                                                                                                                                                                                                                       |
| -d           | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| <Signature>  | The signature string within the license.<br>To see the license signature string, run the <i>"cplic print" on page 152</i> command.                                                                                                                                                                                                         |

## Example

```
[Expert@MGMT:0]# cplic db_rm 2f540abb-d3bcb001-7e54513e-kfyigpwn
```

# cplic del

## Description

Deletes a Check Point license on a host, including unwanted evaluation, expired, and other licenses.

This command can delete a license on both local server, and on remote managed servers.

## Syntax

```
cplic del {-h | -help}
```

```
cplic [-d] del [-F <Output File>] <Signature> <Object Name>
```

You can run this command:

- On a Management Server / Security Gateway / Cluster Member in Gaia Clish or the Expert mode
- On a Scalable Platform Security Group in Gaia gClish or the Expert mode

## Parameters

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {-h   -help}     | Shows the applicable built-in usage.                                                                                                                                                                                                                                                                                                       |
| -d               | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| -F <Output File> | Saves the command output to the specified file.                                                                                                                                                                                                                                                                                            |
| <Signature>      | The signature string within the license.<br>To see the license signature string, run the <a href="#">"cplic print" on page 152</a> command.                                                                                                                                                                                                |
| <Object Name>    | The name of the Security Gateway / Cluster Member object as configured in SmartConsole.                                                                                                                                                                                                                                                    |

## cplic del <object name>

### Description

Detaches a Central license from a remote managed Security Gateway or Cluster Member.

When you run this command, it automatically updates the license repository.

The Central license remains in the license repository as an unattached license.

### Syntax

```
cplic del {-h | -help}
```

```
cplic [-d] del <Object Name> [-F <Output File>] [-ip <Dynamic IP Address>] <Signature>
```

### Parameters

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {-h   -help}             | Shows the applicable built-in usage.                                                                                                                                                                                                                                                                                                       |
| -d                       | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| <Object Name>            | The name of the Security Gateway / Cluster Member object as defined in SmartConsole.                                                                                                                                                                                                                                                       |
| -F <Output File>         | Saves the command output to the specified file.                                                                                                                                                                                                                                                                                            |
| -ip <Dynamic IP Address> | Deletes the license on the DAIP Security Gateway with the specified IP address.<br><b>Note</b> - If this parameter is used, then object name must be a DAIP Security Gateway.                                                                                                                                                              |
| <Signature>              | The signature string within the license.<br>To see the license signature string, run the <a href="#">"cplic print" on page 152</a> command.                                                                                                                                                                                                |

# cplic get

## Description

Retrieves all licenses from managed Security Gateways and Cluster Members into the license repository on the Management Server.

This command helps synchronize the license repository with the managed Security Gateways and Cluster Members.

When you run this command, it updates the license repository with all local changes.

## Syntax

```
cplic get {-h | -help}

cplic [-d] get
      -all
      <IP Address>
      <Host Name>
```

## Parameters

| Parameter    | Description                                                                                                                                                                                                                                                             |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {-h   -help} | Shows the applicable built-in usage.                                                                                                                                                                                                                                    |
| -d           | <p>Runs the command in debug mode.</p> <p>Use only if you troubleshoot the command itself.</p> <p>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> |
| -all         | Retrieves licenses from all Security Gateways and Cluster Members in the managed network.                                                                                                                                                                               |
| <IP Address> | The IP address of the Security Gateway / Cluster Member, from which licenses are to be retrieved.                                                                                                                                                                       |
| <Host Name>  | The name of the Security Gateway / Cluster Member object as defined in SmartConsole, from which licenses are to be retrieved.                                                                                                                                           |

## Example

If the Security Gateway with the object name `MyGW` contains four Local licenses, and the license repository contains two other Local licenses, the command `"cplic get MyGW"` produces output similar to this:

```
[Expert@MGMT:0]# cplic get MyGW
Get retrieved 4 licenses.
Get removed 2 licenses.
[Expert@MGMT:0]#
```

# cplic print

## Description

Prints details of the installed Check Point licenses on the local Check Point server.

### Notes:

- On a Security Gateway / Cluster Member / Scalable Platform Security Group, this command prints all installed licenses (both Local and Central).
- Before installing a valid license, and after you establish SIC between this Security Gateway / Cluster Member and its Management Server, this command shows the trial license.

## Syntax

```
cplic print {-h | -help}
```

```
cplic [-d] print[{-n | -noheader}] [-x] [{-t | -type}] [-F <Output File>] [{-p | -preatures}] [-D]
```

You can run this command:

- On a Management Server / Security Gateway / Cluster Member in Gaia Clish or the Expert mode
- On a Scalable Platform Security Group in Gaia gClish or the Expert mode

## Parameters

| Parameter        | Description                                                                                                                                                                                                                                            |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {-h   -help}     | Shows the applicable built-in usage.                                                                                                                                                                                                                   |
| -d               | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br><b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| {-n   -noheader} | Prints licenses without the output header.                                                                                                                                                                                                             |
| -x               | Prints licenses and their signature.                                                                                                                                                                                                                   |
| {-t   -type}     | Prints licenses and their type: Central or Local.                                                                                                                                                                                                      |
| -F <Output File> | Saves the command output to the specified file.                                                                                                                                                                                                        |

| Parameter         | Description                                                                                                                                                                                                                            |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {-p   -preatures} | Prints licenses and their primitive features.<br> <b>Best Practice</b> - Use this syntax: <div> cplic print -n -p   tr ' ' '\n'  <br/> sort -u </div> |
| -D                | On a Multi-Domain Server, prints only Domain licenses.                                                                                                                                                                                 |

### Example 1

```
[Expert@HostName:0]# cplic print
Host      Expiration  Features
192.168.3.28  25Aug2019  CPMP-XXX  CK-XXXXXXXXXXXXX
[Expert@HostName:0]#
```

### Example 2

```
[Expert@HostName:0]# cplic print -n
192.168.3.28  25Aug2019  CPMP-XXX  CK-XXXXXXXXXXXXX
[Expert@HostName:0]#
```

### Example 3

```
[Expert@HostName:0]# cplic print -x
Host      Expiration  Signature                                     Features
192.168.3.28  25Aug2019  xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx  CPMP-XXX  CK-XXXXXXXXXXXXX
[Expert@HostName:0]#
```

### Example 4

```
[Expert@HostName:0]# cplic print -t
Type      Host      Expiration  Features
central   192.168.3.28  25Aug2019  CPMP-XXX  CK-XXXXXXXXXXXXX
[Expert@HostName:0]#
```

## Example 5

```
[Expert@HostName:0]# cplic print -t
Host      Expiration  Features
192.168.3.28  25Aug2019    CPMP-XXX  CK-XXXXXXXXXXXXX fw1:6.0:swb fw1:6.0:zp fw1:6.0:ctnt ...
[Expert@HostName:0]#

[Expert@HostName:0]# cplic print -n -p | tr ' ' '\n' | sort -u

# cplic put

## Description

Installs one or more Local licenses on a Check Point server.

**Note** - You get the license details in the [Check Point User Center](#).

## Syntax

```
cplic put {-h | -help}
```

```
cplic [-d] put [{-o | -overwrite}] [{-c | -check-only}] [{-s | -select}] [-F <Output File>] [{-P | -Pre-boot}] [{-k | -kernel-only}] -l <License File> [<Host>] [<Expiration Date>] [<Signature>] [<SKU/Features>]
```

You can run this command:

- On a Management Server / Security Gateway / Cluster Member in Gaia Clish or the Expert mode
- On a Scalable Platform Security Group in Gaia gClish or the Expert mode

## Parameters

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {-h   -help}       | Shows the applicable built-in usage.                                                                                                                                                                                                                                                                                                       |
| -d                 | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| {-o   -overwrite}  | On a Security Gateway / Cluster Member / Scalable Platform Security Group, this command erases only the local licenses, but not central licenses that are installed remotely.                                                                                                                                                              |
| {-c   -check-only} | Verifies the license. Checks if the IP of the license matches the Check Point server and if the signature is valid.                                                                                                                                                                                                                        |
| {-s   -select}     | Selects only the local license whose IP address matches the IP address of the Check Point server.                                                                                                                                                                                                                                          |

| Parameter                            | Description                                                                                                                                                                                                                           |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-F &lt;Output File&gt;</code>  | Saves the command output to the specified file.                                                                                                                                                                                       |
| <code>{-P   -Pre-boot}</code>        | Use this option after you have upgraded and before you reboot the Check Point server.<br>Use of this option will prevent certain error messages.                                                                                      |
| <code>{-K   -kernel-only}</code>     | Pushes the current valid licenses to the kernel.<br>For use by Check Point Support only.                                                                                                                                              |
| <code>-l &lt;License File&gt;</code> | Name of the file that contains the license.                                                                                                                                                                                           |
| <code>&lt;Host&gt;</code>            | Hostname or IP address of the Security Gateway / Cluster Member / Scalable Platform Security Group for a local license.<br>Hostname or IP address of the Security Management Server / Domain Management Server for a central license. |
| <code>&lt;Expiration Date&gt;</code> | The license expiration date.                                                                                                                                                                                                          |
| <code>&lt;Signature&gt;</code>       | The signature string within the license.<br>Case sensitive. The hyphens are optional.                                                                                                                                                 |
| <code>&lt;SKU/Features&gt;</code>    | The SKU of the license summarizes the features included in the license.<br>For example: CPSUITE-EVAL-3DES-vNG                                                                                                                         |

Copy and paste the parameters from the license received from the User Center:

| Parameter       | Description                                                                                                                                                                                     |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| host            | The IPv4 address of the external interface (in quad-dot notation).                                                                                                                              |
| expiration date | The license expiration date. It can be <code>never</code> .                                                                                                                                     |
| signature       | The license signature string.<br>Case sensitive. The hyphens are optional.                                                                                                                      |
| SKU/features    | A string listing the SKU and the Certificate Key of the license.<br>The SKU of the license summarizes the features included in the license.<br>For example: CPSB-SWB CPSB-ADNC-M CK0123456789ab |

## Example

```
[Expert@HostName:0]# cplic put -l License.lic
Host Expiration SKU
192.168.2.3 14Jan2016 CPSB-SWB CPSB-ADNC-M CK0123456789ab
[Expert@HostName:0]#
```

# cplic put <object name>

## Description

Attaches one or more Central or Local licenses to a remote managed Security Gateways and Cluster Members.

When you run this command, it automatically updates the license repository.

## Note

- You get the license details in the [Check Point User Center](#).
- You can attach more than one license.

## Syntax

```
cplic put {-h | -help}
```

```
cplic [-d] put <Object Name> [-ip<Dynamic IP Address> ] [-F  
<Output File>] -l <License File> [<Host>] [<Expiration Date>]  
[<Signature>] [<SKU/Feature>]
```

## Parameters

| Parameter                                   | Description                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>{-h   -help}</code>                   | Shows the applicable built-in usage.                                                                                                                                                                                                                                                                                                                                                                  |
| <code>-d</code>                             | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p>                                                  |
| <code>&lt;Object Name&gt;</code>            | The name of the Security Gateway / Cluster Member object, as defined in SmartConsole.                                                                                                                                                                                                                                                                                                                 |
| <code>-ip &lt;Dynamic IP Address&gt;</code> | <p>Installs the license on the Security Gateway with the specified IP address.<br/>This parameter is used to install a license on a Security Gateway with dynamically assigned IP address (DAIP).</p> <p> <b>Note</b> - If you use this parameter, then the object name must be that of a DAIP Security Gateway.</p> |
| <code>-F &lt;Output File&gt;</code>         | Saves the command output to the specified file.                                                                                                                                                                                                                                                                                                                                                       |
| <code>-l &lt;License File&gt;</code>        | Installs the licenses from the <i>&lt;License file&gt;</i> .                                                                                                                                                                                                                                                                                                                                          |
| <code>&lt;Host&gt;</code>                   | Hostname or IP address of the Security Management Server / Domain Management Server.                                                                                                                                                                                                                                                                                                                  |
| <code>&lt;Expiration Date&gt;</code>        | The license expiration date.                                                                                                                                                                                                                                                                                                                                                                          |
| <code>&lt;Signature&gt;</code>              | <p>The license signature string.<br/>Case sensitive. The hyphens are optional.</p>                                                                                                                                                                                                                                                                                                                    |
| <code>&lt;SKU/Features&gt;</code>           | <p>The SKU of the license summarizes the features included in the license.<br/>For example: CPSUITE-EVAL-3DES-vNG</p>                                                                                                                                                                                                                                                                                 |

Copy and paste the parameters from the license received from the User Center:

| Parameter          | Description                                                                                                                                                                                     |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| host               | The IP address of the external interface (in quad-dot notation).<br>The last part cannot be 0 or 255.                                                                                           |
| expiration<br>date | The license expiration date. It can be <code>never</code> .                                                                                                                                     |
| signature          | The license signature string.<br>Case sensitive. The hyphens are optional.                                                                                                                      |
| SKU/features       | A string listing the SKU and the Certificate Key of the license.<br>The SKU of the license summarizes the features included in the license.<br>For example: CPSB-SWB CPSB-ADNC-M CK0123456789ab |

# cplic upgrade

## Description

Upgrades licenses in the license repository with licenses in the specified license file.

**Note** - You get this license file in the [Check Point User Center](#).

## Syntax

```
cplic upgrade {-h | -help}

cplic [-d] upgrade -l <Input File>
```

## Parameters

| Parameter       | Description                                                                                                                                      |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| {-h   -help}    | Shows the applicable built-in usage.                                                                                                             |
| -l <Input File> | Upgrades the licenses in the license repository and Check Point Security Gateways / Cluster Members to match the licenses in the specified file. |

## Example

This example explains the procedure to upgrade the licenses in the license repository.

There are two Software Blade licenses in the input file:

- One license does not match any license on a remote managed Security Gateway.
- The other license matches an NGX-version license on a managed Security Gateway that has to be upgraded.

Workflow in this example:

1. Upgrade the Security Management Server to the latest version.  
Ensure that there is connectivity between the Security Management Server and the Security Gateways with the previous product versions.
2. Import all licenses into the license repository.  
You can also do this after you upgrade the products on the remote Security Gateways.
3. Run this command:

```
cplic get -all
```

**Example:**

```
[Expert@MyMGMT]# cplic get -all
Getting licenses from all modules ...
MyGW:
Retrieved 1 licenses
```

4. To see all the licenses in the repository, run this command:

```
cplic db_print -all -a
```

**Example:**

```
[Expert@MyMGMT]# cplic db_print -all -a
Retrieving license information from database ...

The following licenses appear in the database:
=====
Host Expiration Features
192.0.2.11 Never CPEW-FIG-25-53 CK49C3A3CC7121 MyGW1
192.0.2.11 26Nov2017 CPSB-SWB CPSB-ADNC-M CK0123456789ab MyGW2
```

5. In the [Check Point User Center](#), view the licenses for the products that were upgraded from version NGX to a Software Blades license.

You can also create new upgraded licenses.

6. Download a file containing the upgraded licenses.

Only download licenses for the products that were upgraded from version NGX to Software Blades.

7. If you did not import the version NGX licenses into the repository, import the version NGX licenses now.

Use this command:

```
cplic get -all
```

8. Run the license upgrade command:

```
cplic upgrade -l <Input File>
```

- The licenses in the downloaded license file and in the license repository are compared.
- If the certificate keys and features match, the old licenses in the repository and in the remote Security Gateways are updated with the new licenses.
- A report of the results of the license upgrade is printed.

For more about managing licenses, see the [\*R82.10 Security Management Administration Guide\*](#).

# CPLogInvestigator

## Description

This heuristic tool can analyze the specified logs files from managed Security Gateways and show:

- The estimated number of events per day.
- The number of logs from each Software Blade.
- The number of logs during each minute.

**Important** - You can run this command only in the Expert mode.

## Syntax

```
CPLogInvestigator
  [-h]
  [-d]
  [-a]
  [{-i /<Path>/<Name of Log File> | -f <Path to Directory>}]
  [-l]
  [-m]
  [-p]
  [-u <Number of Users>]
```

## Parameters

| Parameter                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -h                               | Shows the built-in help.                                                                                                                                                                                                                                                                                                                                                                                                              |
| No Parameters                    | Analyzes the events in all the <code>\$FWDIR/log/*.log</code> files (the active log and the rotated logs).<br>The default analysis duration for each log file is 60 seconds.                                                                                                                                                                                                                                                          |
| -d                               | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.<br>This option "-d" is not supported (ignored) when specified together with the option "-p". |
| -a                               | Analyzes the events in all the "*.log" files - the active log and the rotated logs.<br>The default path is <code>\$FWDIR/log/</code> .<br>The default analysis duration is 60 seconds.<br>If the number of log files is large, and the log files are large, then the analysis can take significant time.                                                                                                                              |
| -f <Path to Directory>           | Analyzes the events in all the "*.log" files in the specified directory.<br>This parameter must be the last parameter in the syntax.                                                                                                                                                                                                                                                                                                  |
| -i<br>/<Path>/<Name of Log File> | Analyzes the events in the specified log file.<br>This parameter must be the last parameter in the syntax.                                                                                                                                                                                                                                                                                                                            |
| -l                               | Limits the duration of the analysis to 60 seconds.                                                                                                                                                                                                                                                                                                                                                                                    |
| -m                               | Saves the number of logs for each minute of analyzed log files in the output file called "logPerMinute.txt" in the current working directory.                                                                                                                                                                                                                                                                                         |
| -p                               | Shows the daily estimated number of logs from each Software Blade that generated these logs.                                                                                                                                                                                                                                                                                                                                          |
| -u <Number of Users>             | Specifies the number of required users to show estimations for events from the Application Control and the URL Filtering Software Blades.                                                                                                                                                                                                                                                                                             |

## Examples

### Example 1 - "CPLogInvestigator" (command without parameters)

```
[Expert@Mgmt:0]# CPLogInvestigator

Thank you for using log investigator tool.

=====

Total scanned 36245 logs out of 36245 logs in file
Scanned logs dates are from 09-04-2025 00:00:02 to 11-04-2025 21:37:49
Observed blades:
  - Application Control
  - N/A
  - VPN-1 & FireWall-1

=====

Summary - Estimations based on findings:

Log file size per day: 0.0032GB (12492 logs)

Estimated events per day:
- Estimated events per day based on active blades: 0
- Activated blades + Application Control and URL Filtering for 1000 users: 250000

Storage required per day:
- SmartEvent: 1GB
- Log Server: 0.0032GB
- Log Server + SmartLog: 0.0064GB

=====
[Expert@Mgmt:0]#
```

# cppkg

## Description

Manages the SmartUpdate software packages repository on the Security Management Server.

 **Important** - Installing software packages with the SmartUpdate is not supported for Security Gateways running on Gaia OS.

## Syntax

```
cppkg
    add <options>
    {del | delete} <options>
    get
    getroot
    print
    setroot <options>
```

## Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the MDS (run `mdsenv`).

## Parameters

| Parameter                                   | Description                                                                                                                                                                 |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>add &lt;options&gt;</code>            | Adds a SmartUpdate software package to the repository.<br>See <a href="#">"cppkg add" on page 173</a> .                                                                     |
| <code>{del   delete} &lt;options&gt;</code> | Deletes a SmartUpdate software package from the repository.<br>See <a href="#">"cppkg delete" on page 174</a> .                                                             |
| <code>get</code>                            | Updates the list of the SmartUpdate software packages in the repository.<br>See <a href="#">"cppkg get" on page 176</a> .                                                   |
| <code>getroot</code>                        | Shows the path to the root directory of the repository (the value of the environment variable <code>\$SUROOT</code> ).<br>See <a href="#">"cppkg getroot" on page 177</a> . |
| <code>print</code>                          | Prints the list of SmartUpdate software packages in the repository.<br>See <a href="#">"cppkg print" on page 178</a> .                                                      |
| <code>setroot &lt;options&gt;</code>        | Configures the path to the root directory of the repository.<br>See <a href="#">"cppkg setroot" on page 179</a> .                                                           |

# cppkg add

## Description

Adds a SmartUpdate software package to the SmartUpdate software packages repository.

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the MDS (run the `mdsenv` command).
- This command does not overwrite existing packages. To overwrite an existing package, you must first delete the existing package.
- You get the SmartUpdate software packages from the [Check Point Support Center](#).

## Syntax

```
cppkg add <Full Path to Package | DVD Drive [Product]>
```

## Parameters

| Parameter                           | Description                                                                        |
|-------------------------------------|------------------------------------------------------------------------------------|
| <i>&lt;Full Path to Package&gt;</i> | Specifies the full local path on the computer to the SmartUpdate software package. |
| <i>DVD Drive [Product]</i>          | Specifies the DVD root path.<br>Example: <code>/mnt/CPR80</code>                   |

## Example - Adding R77.20 HFA\_75 (R77.20.75) firmware package for 1100 Appliances

```
[Expert@MGMT:0]# cppkg print
Vendor          Product          Version    OS          Minor Version
-----
[Expert@MGMT:0]#

[Expert@MGMT:0]# cppkg add /var/log/CP1100_6.0_4_0_-.tgz
Adding package to the repository
Getting the package type...
Extracting the package files...
Copying package to the repository...
Package was successfully added to the repository
[Expert@MGMT:0]#

[Expert@MGMT:0]# cppkg print
Vendor          Product          Version    OS          Minor Version
-----
Check Point     CP1100           R77.20Gaia Embedded  R77.20
[Expert@MGMT:0]#
```

# cppkg delete

## Description

Deletes SmartUpdate software packages from the SmartUpdate software packages repository.

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the MDS (run the `mdsenv` command).

## Syntax

```
cppkg del ["<Vendor>" "<Product>" "<Major Version>" "<OS>" "<Minor Version>"]
```

```
cppkg delete ["<Vendor>" "<Product>" "<Major Version>" "<OS>" "<Minor Version>"]
```

## Parameters

| Parameter         | Description                                                                                                                                |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| del   delete      | When you do not specify optional parameters, the command runs in the interactive mode. The command shows the menu with applicable options. |
| "<Vendor>"        | Specifies the package vendor. Enclose in double quotes.                                                                                    |
| "<Product>"       | Specifies the product name. Enclose in double quotes.                                                                                      |
| "<Major Version>" | Specifies the package Major Version. Enclose in double quotes.                                                                             |
| "<OS>"            | Specifies the package OS. Enclose in double quotes.                                                                                        |
| "<Minor Version>" | Specifies the package Minor Version. Enclose in double quotes.                                                                             |

### Notes:

- To see the values for the optional parameters, run the ["cppkg print" on page 178](#) command.
- You must specify all optional parameters, or no parameters.

## Example 1 - Interactive mode

```
[Expert@MGMT:0]# cppkg delete

Select package:
-----
(0) Delete all
(1) CP1100 Gaia Embedded Check Point R77.20 R77.20

(e) Exit

Enter your choice : 1

You chose to delete 'CP1100 Gaia Embedded Check Point R77.20 R77.20', Is this correct? [y/n] : y

Package was successfully removed from the repository
[Expert@MGMT:0]#
```

## Example 2 - Manually deleting the specified package

```
Expert@MGMT:0]# cppkg print
Vendor          Product          Version  OS          Minor Version
-----
Check Point     CP1100           R77.20   Gaia Embedded  R77.20
[Expert@MGMT:0]#

[Expert@MGMT:0]# cppkg delete "Check Point" "CP1100" "R77.20" "Gaia Embedded" "R77.20"
Package was successfully removed from the repository
[Expert@MGMT:0]#
```

# cppkg get

## Description

Updates the list of the SmartUpdate software packages in the SmartUpdate software packages repository based on the real content of the repository.

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the MDS (run the `mdsenv` command).

## Syntax

```
cppkg get
```

## Example

```
[Expert@MGMT:0]# cppkg get
Update successfully completed
[Expert@MGMT:0]#
```

# cppkg getroot

## Description

Shows the path to the root directory of the SmartUpdate software packages repository (the value of the environment variable `$SUROOT`)

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the MDS (run the `mdsenv` command).

## Syntax

```
cppkg getroot
```

## Example

```
[Expert@MGMT:0]# cppkg getroot
[cppkg 7119 4128339728]@MGMT[29 May 19:16:06] Current repository root is set to :
/var/log/cpupgrade/suroot
[Expert@MGMT:0]#
```

# cppkg print

## Description

Prints the list of SmartUpdate software packages in the SmartUpdate software packages repository.

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the MDS (run the `mdsenv` command).

## Syntax

```
cppkg print
```

### Example - R77.20 HFA\_75 (R77.20.75) firmware package for 1100 Appliances

```
[Expert@MGMT:0]# cppkg print
Vendor          Product          Version    OS          Minor Version
-----
Check Point     CP1100             R77.20Gaia Embedded  R77.20
[Expert@MGMT:0]#
```

# cppkg setroot

## Description

Configures the path to the root directory of the SmartUpdate software packages repository.

## Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the MDS (run the `mdsenv` command).
- The default path is: `/var/log/cpupgrade/suroot`
- When changing repository root directory:
  - This command copies the software packages from the old repository to the new repository. A package in the new location is overwritten by a package from the old location, if the packages have the same name.
  - This command updates the value of the environment variable `$SUROOT` in the Check Point Profile shell scripts (`$CPDIR/tmp/.CPprofile.sh` and `$CPDIR/tmp/.CPprofile.csh`).

## Syntax

```
cppkg setroot <Full Path to Repository Root Directory>
```

## Example

```
[Expert@MGMT:0]# cppkg setroot /var/log/my_directory

Repository root is set to : /var/log/cpupgrade/suroot

Note : When changing repository root directory :

    1. Old repository content will be copied into the new repository
    2. A package in the new location will be overwritten by a package in the old
       location, if the packages have the same name

Change the current repository root ? [y/n] : y

The new repository directory does not exist. Create it ? [y/n] : y

Repository root was set to : /var/log/my_directory

Notice : To complete the setting of your directory, reboot the machine!
[Expert@MGMT:0]#
```

# cpprod\_util

## Description

This utility works with Check Point Registry (\$CPDIR/registry/HKLM\_registry.data) without manually opening it:

- Shows which Check Point products and features are enabled on this Check Point server.
- Enables and disables Check Point products and features on this Check Point server.

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cpprod_util CPPROD_GetValue "<Product>" "<Parameter>" {0|1}
```

```
cpprod_util CPPROD_SetValue "<Product>" "<Parameter>" {1|4}  
"<Value>" {0|1}
```

```
cpprod_util -dump
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cpprod_util CPPROD_GetValue "<Product>" "<Parameter>" {0|1}
```

```
cpprod_util CPPROD_SetValue "<Product>" "<Parameter>" {1|4}  
"<Value>" {0|1}
```

```
cpprod_util -dump
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpprod_util CPPROD_GetValue "<Product>" "<Parameter>" {0|1}
```

```
cpprod_util CPPROD_SetValue "<Product>" "<Parameter>" {1|4}  
"<Value>" {0|1}
```

```
cpprod_util -dump
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpprod_util CPPROD_GetValue "<Product>" "<Parameter>" {0|1}
```

```
g_all cpprod_util CPPROD_SetValue "<Product>" "<Parameter>" {1|4}  
"<Value>" {0|1}
```

```
g_all cpprod_util -dump
```

## Parameters

| Parameter             | Description                                                                                                                                                                                                                                                         |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CPPROD_<br>GetValue   | Gets the configuration status of the specified product or feature: <ul style="list-style-type: none"> <li>▪ 0 - Disabled</li> <li>▪ 1 - Enabled</li> </ul>                                                                                                          |
| CPPROD_<br>SetValue   | Sets the configuration for the specified product or feature.<br> <b>Important</b> - Do not run these commands unless explicitly instructed by Check Point Support or R&D to do so. |
| "<Product<br>>"       | Specifies the product or feature.                                                                                                                                                                                                                                   |
| "<<br>Parameter<br>>" | Specifies the configuration parameter for the specified product or feature.                                                                                                                                                                                         |
| "<Value>"             | Specifies the value of the configuration parameter for the specified product or feature: <ul style="list-style-type: none"> <li>▪ One of these integers: 0, 1, 4</li> <li>▪ A string</li> </ul>                                                                     |
| dump                  | Creates a dump file of the Check Point Registry (\$CPDIR/registry/HKLM_registry.data) in the current working directory.<br>The name of the output file is RegDump.                                                                                                  |

## Notes

- On a Multi-Domain Server, you must run this command in the context of the relevant Domain Management Server.
- If you run the "cprod\_util" command without parameters, it prints:
  - The list of all available products and features (for example, "FwIsFirewallMgmt", "FwIsLogServer", "FwIsStandAlone")
  - The type of the expected argument when you configure a product or feature ("no-parameter", "string-parameter", or "integer-parameter")
  - The type of the returned output ("status-output", or "no-output")
- To redirect the output of the "cprod\_util" command, it is necessary to redirect the *stderr* to *stdout*:

```
cprod_util <options> > <output file> 2>&1
```

Example:

```
cprod_util > /tmp/output_of_cprod_util.txt 2>&1
```

## Examples

### Example - Showing a list of all installed Check Point Products Packages on a Management Server

# cprid

## Description

Manages the Check Point Remote Installation Daemon (`cprid`).

This daemon is used for remote upgrade and installation of Check Point products on the managed Security Gateways.

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run these commands in the context of the MDS (`run mdsenv`).

## Commands

| Syntax                         | Description                                                                              |
|--------------------------------|------------------------------------------------------------------------------------------|
| <code>cpridstart</code>        | Starts the Check Point Remote Installation Daemon ( <code>cprid</code> ).                |
| <code>cpridstop</code>         | Stops the Check Point Remote Installation Daemon ( <code>cprid</code> ).                 |
| <code>run_cprid_restart</code> | Stops and then starts the Check Point Remote Installation Daemon ( <code>cprid</code> ). |

# cprinstall

## Description

Performs installation of Check Point product packages and associated operations on remote managed Security Gateways.

 **Important** - Installing software packages with this command is not supported for Security Gateways that run on Gaia OS.

 **Notes:**

- This command requires a license for SmartUpdate.
- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

- On the remote Security Gateways these are required:
  - SIC Trust must be established between the Security Management Server and the Security Gateway.
  - The `cpd` daemon must run.
  - The `cpuid` daemon must run.

## Syntax

```
cprinstall
  boot <options>
  cprestart <options>
  cpstart <options>
  cpstop <options>
  delete <options>
  get <options>
  install <options>
  revert <options>
  show <options>
  snapshot <options>
  transfer <options>
  uninstall <options>
  verify <options>
```

## Parameters

| Parameter                                              | Description                                                                                                                                                                                                                                                                              |
|--------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>boot</code><br><code>&lt;options&gt;</code>      | Reboots the managed Security Gateway.<br>See <a href="#">"cprinstall boot" on page 190</a> .                                                                                                                                                                                             |
| <code>cprestart</code><br><code>&lt;options&gt;</code> | Runs the <code>cprestart</code> command on the managed Security Gateway.<br>See <a href="#">"cprinstall cprestart" on page 191</a> .                                                                                                                                                     |
| <code>cpstart</code><br><code>&lt;options&gt;</code>   | Runs the <code>cpstart</code> command on the managed Security Gateway.<br>See <a href="#">"cprinstall cpstart" on page 192</a> .                                                                                                                                                         |
| <code>cpstop</code><br><code>&lt;options&gt;</code>    | Runs the <code>cpstop</code> command on the managed Security Gateway.<br>See <a href="#">"cprinstall cpstop" on page 193</a> .                                                                                                                                                           |
| <code>delete</code><br><code>&lt;options&gt;</code>    | Deletes a snapshot (backup) file on the managed Security Gateway.<br>See <a href="#">"cprinstall delete" on page 194</a> .                                                                                                                                                               |
| <code>get</code><br><code>&lt;options&gt;</code>       | <ul style="list-style-type: none"> <li>■ Gets details of the products and the operating system installed on the managed Security Gateway.</li> <li>■ Updates the management database on the Security Management Server.</li> </ul><br>See <a href="#">"cprinstall get" on page 195</a> . |
| <code>install</code><br><code>&lt;options&gt;</code>   | Installs Check Point products on the managed Security Gateway.<br>See <a href="#">"cprinstall install" on page 196</a> .                                                                                                                                                                 |
| <code>revert</code><br><code>&lt;options&gt;</code>    | Restores the managed Security Gateway that runs on SecurePlatform OS from a snapshot saved on that Security Gateway.<br>See <a href="#">"cprinstall revert" on page 199</a> .                                                                                                            |
| <code>show</code><br><code>&lt;options&gt;</code>      | Displays all snapshot (backup) files on the managed Security Gateway that runs on SecurePlatform OS.<br>See <a href="#">"cprinstall show" on page 200</a> .                                                                                                                              |
| <code>snapshot</code><br><code>&lt;options&gt;</code>  | Creates a snapshot on the managed Security Gateway that runs on SecurePlatform OS and saves it on that Security Gateway.<br>See <a href="#">"cprinstall snapshot" on page 201</a> .                                                                                                      |
| <code>transfer</code><br><code>&lt;options&gt;</code>  | Transfers a software package from the repository to the managed Security Gateway without installing the package.<br>See <a href="#">"cprinstall transfer" on page 202</a> .                                                                                                              |
| <code>uninstall</code><br><code>&lt;options&gt;</code> | Uninstalls Check Point products on the managed Security Gateway.<br>See <a href="#">"cprinstall uninstall" on page 204</a> .                                                                                                                                                             |

| Parameter                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>verify</code><br><code>&lt;options&gt;</code> | <p>Confirms these operations were successful:</p> <ul style="list-style-type: none"><li>▪ If a specific product can be installed on the managed Security Gateway.</li><li>▪ That the operating system and currently installed products the managed Security Gateway are appropriate for the software package.</li><li>▪ That there is enough disk space to install the product the managed Security Gateway.</li><li>▪ That there is a CPRID connection with the managed Security Gateway.</li></ul> <p>See <a href="#">"cprinstall verify" on page 206</a>.</p> |

# cprinstall boot

## Description

Reboots the managed Security Gateway.

### Notes:

- You must run this command from the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsend <IP Address or Name of Domain Management Server>
```

## Syntax

```
cprinstall boot <Object Name>
```

## Parameters

| Parameter                  | Description                                                            |
|----------------------------|------------------------------------------------------------------------|
| <i>&lt;Object Name&gt;</i> | The name of the Security Gateway object as configured in SmartConsole. |

## Example

```
[Expert@MGMT]# cprinstall boot MyGW
```

# cprinstall cprestart

## Description

Runs the `cprestart` command on the managed Security Gateway.

### Notes:

- You must run this command from the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsend <IP Address or Name of Domain Management Server>
```

- All Check Point products on the managed Security Gateway must be of the same version.

## Syntax

```
cprinstall cprestart <Object Name>
```

## Parameters

| Parameter                  | Description                                                            |
|----------------------------|------------------------------------------------------------------------|
| <i>&lt;Object Name&gt;</i> | The name of the Security Gateway object as configured in SmartConsole. |

## Example

```
[Expert@MGMT:0]# cprinstall cprestart MyGW
```

# cprinstall cpstart

## Description

Runs the `cpstart` command on the managed Security Gateway.

### Notes:

- You must run this command from the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsend <IP Address or Name of Domain Management Server>
```

- All Check Point products on the managed Security Gateway must be of the same version.

## Syntax

```
cprinstall cpstart <Object Name>
```

## Parameters

| Parameter                  | Description                                                            |
|----------------------------|------------------------------------------------------------------------|
| <i>&lt;Object Name&gt;</i> | The name of the Security Gateway object as configured in SmartConsole. |

## Example

```
[Expert@MGMT]# cprinstall cpstart MyGW
```

# cprinstall cpstop

## Description

Runs the `cpstop` command on the managed Security Gateway.

### Notes:

- You must run this command from the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsend <IP Address or Name of Domain Management Server>
```

- All Check Point products on the managed Security Gateway must be of the same version.

## Syntax

```
cprinstall cpstop {-proc | -nopolicy} <Object Name>
```

## Parameters

| Parameter                        | Description                                                                                                                                                                                                                                        |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-proc</code>               | Kills the Check Point daemons and Security Servers, while it maintains the active Security Policy running in the Check Point kernel.<br>Rules with generic <i>Allow</i> , <i>Drop</i> or <i>Reject</i> action based on services, continue to work. |
| <code>-nopolicy</code>           | Kills the Check Point daemons and Security Servers and unloads the Security Policy from the Check Point kernel.                                                                                                                                    |
| <code>&lt;Object Name&gt;</code> | The name of the Security Gateway object as configured in SmartConsole.                                                                                                                                                                             |

## Example

```
[Expert@MGMT]# cprinstall cpstop -proc MyGW
```

# cprinstall delete

## Description

Deletes a snapshot (backup) file on the managed Security Gateway that runs on SecurePlatform OS.

### Notes:

- You must run this command from the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
cprinstall delete <Object Name> <Snapshot File>
```

## Parameters

| Parameter       | Description                                                            |
|-----------------|------------------------------------------------------------------------|
| <Object Name>   | The name of the Security Gateway object as configured in SmartConsole. |
| <Snapshot File> | Specifies the name of the snapshot (backup) on SecurePlatform OS.      |

## Example

```
[Expert@MGMT]# cprinstall delete MyGW Snapshot25Apr2017
```

# cprinstall get

## Description

- Gets details of the products and the operating system installed on the managed Security Gateway.
- Updates the management database on the Security Management Server.

### Notes:

- You must run this command from the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
cprinstall get <Object Name>
```

## Parameters

| Parameter     | Description                                                            |
|---------------|------------------------------------------------------------------------|
| <Object Name> | The name of the Security Gateway object as configured in SmartConsole. |

## Example:

```
[Expert@MGMT]# cprinstall get MyGW
Checking cprid connection...
Verified
Operation completed successfully
Updating machine information...
Update successfully completed
'Get Gateway Data' completed successfully
Operating system   Major Version   Minor Version
-----
SecurePlatform    R75.20R75.20

Vendor            Product          Major Version   Minor Version
-----
Check Point       VPN-1 Power/UTM  R75.20R75.20
R75.20R75.20      Check Point      SmartPortal     R75.20R75.20
SecurePlatform
[Expert@MGMT]#
```

# cprinstall install

## Description

Installs Check Point products on the managed Security Gateway.

 **Important** - Installing software packages with this command is not supported for Security Gateways that run Gaia OS.

 **Notes:**

- Before transferring the software package, this command runs the "[cprinstall verify](#)" on page 206 command.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

- To see the values for the package attributes, run the "[cppkg print](#)" on page 178 command.

## Syntax

```
cprinstall install [-boot] [-backup] [-skip_transfer] <Object  
Name> "<Vendor>" "<Product>" "<Major Version>" "<Minor Version>"
```

## Parameters

| Parameter                            | Description                                                                                                                                                                                                                                       |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-boot</code>                   | Reboots the managed Security Gateway after installing the package.<br><b>Note</b> - Only reboot after ALL products have the same version. Reboot is canceled in certain scenarios.                                                                |
| <code>-backup</code>                 | Creates a snapshot on the managed Security Gateway before installing the package.<br><b>Note</b> - Only on Security Gateways that runs on SecurePlatform OS.                                                                                      |
| <code>-skip_transfer</code>          | Skip the transfer of the package.                                                                                                                                                                                                                 |
| <code>&lt;Object Name&gt;</code>     | The name of the Security Gateway object as configured in SmartConsole.                                                                                                                                                                            |
| <code>"&lt;Vendor&gt;"</code>        | Specifies the package vendor. Enclose in double quotes.<br>Example: <ul style="list-style-type: none"> <li>■ checkpoint</li> <li>■ Check Point</li> </ul>                                                                                         |
| <code>"&lt;Product&gt;"</code>       | Specifies the product name. Enclose in double quotes.<br>Examples: <ul style="list-style-type: none"> <li>■ SVNfoundation</li> <li>■ firewall</li> <li>■ floodgate</li> <li>■ CP1100</li> <li>■ VPN-1 Power/UTM</li> <li>■ SmartPortal</li> </ul> |
| <code>"&lt;Major Version&gt;"</code> | Specifies the package Major Version. Enclose in double quotes.                                                                                                                                                                                    |
| <code>"&lt;Minor Version&gt;"</code> | Specifies the package Minor Version. Enclose in double quotes.                                                                                                                                                                                    |

## Example

```
[Expert@MGMT]# cprinstall install -boot MyGW "checkpoint" "firewall" "R75" "R75.20"

# cprinstall revert

## Description

Restores the managed Security Gateway that runs on SecurePlatform OS from a snapshot saved on that Security Gateway.

### Notes:

- You must run this command from the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
cprinstall revert <Object Name> <Snapshot File>
```

## Parameters

| Parameter                    | Description                                                                                                                                               |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;Object Name&gt;</i>   | The name of the Security Gateway object as configured in SmartConsole.                                                                                    |
| <i>&lt;Snapshot File&gt;</i> | Name of the SecurePlatform snapshot file.<br>To see the names of the saved snapshot files, run the <a href="#">"cprinstall show" on page 200</a> command. |

# cprinstall show

## Description

Displays all snapshot (backup) files on the managed Security Gateway that runs on SecurePlatform OS.

 **Notes:**

- You must run this command from the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

mdsenv <IP Address or Name of Domain Management Server>

## Syntax

cprinstall show <Object Name>

## Parameters

| Parameter     | Description                                                            |
|---------------|------------------------------------------------------------------------|
| <Object Name> | The name of the Security Gateway object as configured in SmartConsole. |

## Example

[Expert@MGMT]# cprinstall show GW1  
SU\_backup.tzg  
[Expert@MGMT]#

# cprinstall snapshot

## Description

Creates a snapshot on the managed Security Gateway that runs on SecurePlatform OS and saves it on that Security Gateway.

### Notes:

- You must run this command from the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsensv <IP Address or Name of Domain Management Server>
```

## Syntax

```
cprinstall snapshot <Object Name> <Snapshot File>
```

## Parameters

| Parameter                    | Description                                                                                                                                      |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;Object Name&gt;</i>   | The name of the Security Gateway object as configured in SmartConsole.                                                                           |
| <i>&lt;Snapshot File&gt;</i> | Name of the SecurePlatform snapshot file.<br>To see the names of the saved snapshot files, run the <i>"cprinstall show" on page 200</i> command. |

# cprinstall transfer

## Description

Transfers a software package from the repository to the managed Security Gateway without installing the package.

### Notes:

- You must run this command from the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

- To see the values for the package attributes, run the ["cppkg print" on page 178](#) command.

## Syntax

```
cprinstall transfer <Object Name> "<Vendor>" "<Product>" "<Major Version>" "<Minor Version>"
```

## Parameters

| Parameter                            | Description                                                                                                                                                                                     |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;Object Name&gt;</code>     | The name of the Security Gateway object as configured in SmartConsole.                                                                                                                          |
| <code>"&lt;Vendor&gt;"</code>        | Specifies the package vendor. Enclose in double quotes.<br>Example: <ul style="list-style-type: none"> <li>■ checkpoint</li> <li>■ Check Point</li> </ul>                                       |
| <code>"&lt;Product&gt;"</code>       | Specifies the product name. Enclose in double quotes.<br>Examples: <ul style="list-style-type: none"> <li>■ SVNfoundation</li> <li>■ firewall</li> <li>■ floodgate</li> <li>■ CP1100</li> </ul> |
| <code>"&lt;Major Version&gt;"</code> | Specifies the package major version. Enclose in double quotes.                                                                                                                                  |
| <code>"&lt;Minor Version&gt;"</code> | Specifies the package minor version. Enclose in double quotes.                                                                                                                                  |

# cprinstall uninstall

## Description

Uninstalls Check Point products on the managed Security Gateway.

 **Important** - Uninstalling software packages with this command is not supported for Security Gateways running on Gaia OS.

 **Notes:**

- You must run this command from the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

- Before uninstalling product packages, this command runs the "[cprinstall verify on page 206](#)" command.
- After uninstalling a product package, you must run the "[cprinstall get on page 195](#)" command.
- To see the values for the package attributes, run the "[cppkg print on page 178](#)" command.

## Syntax

```
cprinstall uninstall [-boot] <Object Name> "<Vendor>" "<Product>"  
"<Major Version>" "<Minor Version>"
```

## Parameters

| Parameter         | Description                                                                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -boot             | Reboots the managed Security Gateway after uninstalling the package.<br><b>Note</b> - Reboot is canceled in certain scenarios.                                                                  |
| <Object Name>     | The name of the Security Gateway object as configured in SmartConsole.                                                                                                                          |
| "<Vendor>"        | Specifies the package vendor. Enclose in double quotes.<br>Example: <ul style="list-style-type: none"> <li>■ checkpoint</li> <li>■ Check Point</li> </ul>                                       |
| "<Product>"       | Specifies the product name. Enclose in double quotes.<br>Examples: <ul style="list-style-type: none"> <li>■ SVNfoundation</li> <li>■ firewall</li> <li>■ floodgate</li> <li>■ CP1100</li> </ul> |
| "<Major Version>" | Specifies the package major version. Enclose in double quotes.                                                                                                                                  |
| "<Minor Version>" | Specifies the package minor version. Enclose in double quotes.                                                                                                                                  |

## Example

```
[Expert@MGMT]# cprinstall uninstall MyGW "checkpoint" "firewall" "R75.20" "R75.20"
Uninstalling firewall R75.20 from MyGW...
Info : Removing package from Check Point Gateway
Info : Product was successfully applied.
Operation Success. Please get network object data to complete the operation.
[Expert@MGMT]#
[Expert@MGMT]# cprinstall get
```

# cprinstall verify

## Description

Confirms these operations were successful:

- If a specific product can be installed on the managed Security Gateway.
- That the operating system and currently installed products the managed Security Gateway are appropriate for the software package.
- That there is enough disk space to install the product the managed Security Gateway.
- That there is a CPRID connection with the managed Security Gateway.

## Notes:

- You must run this command from the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

- To see the values for the package attributes, run the ["cppkg print" on page 178](#) command.

## Syntax

```
cprinstall verify <Object Name> "<Vendor>" "<Product>" "<Major Version>" ["<Minor Version>"]
```

## Parameters

| Parameter                            | Description                                                                                                                                                                                                                                       |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;Object Name&gt;</code>     | The name of the Security Gateway object as configured in SmartConsole.                                                                                                                                                                            |
| <code>"&lt;Vendor&gt;"</code>        | Specifies the package vendor. Enclose in double quotes.<br>Example: <ul style="list-style-type: none"> <li>■ checkpoint</li> <li>■ Check Point</li> </ul>                                                                                         |
| <code>"&lt;Product&gt;"</code>       | Specifies the product name. Enclose in double quotes.<br>Examples: <ul style="list-style-type: none"> <li>■ SVNfoundation</li> <li>■ firewall</li> <li>■ floodgate</li> <li>■ CP1100</li> <li>■ VPN-1 Power/UTM</li> <li>■ SmartPortal</li> </ul> |
| <code>"&lt;Major Version&gt;"</code> | Specifies the package major version. Enclose in double quotes.                                                                                                                                                                                    |
| <code>"&lt;Minor Version&gt;"</code> | Specifies the package minor version. Enclose in double quotes.<br>This parameter is optional.                                                                                                                                                     |

### Example 1 - Verification succeeds

```
[Expert@MGMT]# cprinstall verify MyGW "checkpoint" "SVNfoundation" "R75.20"
Verifying installation of SVNfoundation R75.20 on MyGW...
Info : Testing Check Point Gateway.
Info : Test completed successfully.
Info : Installation Verified, The product can be installed.
```

### Example 2 - Verification fails

```
[Expert@MGMT]# cprinstall verify MyGW "checkpoint" "SVNfoundation" "R75.20"
Verifying installation of SVNfoundation R75.20 on MyGW...
Info : Testing Check Point Gateway
Info : SVN Foundation R75 is already installed on 192.0.2.134
Operation Success. Product cannot be installed, did not pass dependency check.
```

# cpstart

## Description

Manually starts all Check Point processes and applications.

### Notes:

- For the `cprid` daemon, use the *"cprid" on page 186* command.
- For manually starting specific Check Point processes, see [sk97638](#).

## Syntax

```
cpstart
```

# cpstat

## Description

Shows the status and statistics information for Check Point applications.

### Syntax on a Management Server in Gaia Clish or the Expert mode

```
cpstat [-d] [-h <Host>] [-p <Port>] [-s <SICName>] [-f <Flavor>]
[-o <Polling Interval> [-c <Count>] [-e <Period>]] <Application
Flag>
```

### Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cpstat [-d] [-h <Host>] [-p <Port>] [-s <SICName>] [-f <Flavor>]
[-o <Polling Interval> [-c <Count>] [-e <Period>]] <Application
Flag>
```

### Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpstat [-d] [-h <Host>] [-p <Port>] [-s <SICName>] [-f <Flavor>]
[-o <Polling Interval> [-c <Count>] [-e <Period>]] <Application
Flag>
```

### Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpstat [-d] [-h <Host>] [-p <Port>] [-s <SICName>] [-f
<Flavor>] [-o <Polling Interval> [-c <Count>] [-e <Period>]]
<Application Flag>
```

**Note** - You can write the parameters in the syntax in any order.

## Parameters

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d           | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> <p>The output shows the SNMP queries and SNMP responses for the applicable SNMP OIDs.</p>                                                                                                                                        |
| -h <Host>    | <p>Optional.<br/>When you run this command on a Management Server, this parameter specifies the managed Security Gateway / ClusterXL object.<br/>&lt;Host&gt; is an IPv4 address, a resolvable hostname, or a DAIP object name.<br/>The default is <code>localhost</code>.</p> <p> <b>Note</b> - On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:<br/><code>mdsensv &lt;IP Address or Name of Domain Management Server&gt;</code>.</p> |
| -p <Port>    | <p>Optional.<br/>Port number of the Application Monitoring (AMON) server.<br/>The default port is 18192.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| -s <SICname> | <p>Optional.<br/>Secure Internal Communication (SIC) name of the Application Monitoring (AMON) server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| -f <Flavor>  | <p>Optional.<br/>Specifies the type of the information to collect.<br/>If you do not specify a flavor explicitly, the command uses the first flavor in the &lt;Application Flag&gt;. To see all flavors, run the <code>cpstat</code> command without any parameters.</p>                                                                                                                                                                                                                                                                                                              |

| Parameter                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-o &lt;Polling Interval&gt;</code> | <p>Optional.</p> <p>Specifies the polling interval (in seconds) - how frequently the command collects and shows the information.</p> <p>Examples:</p> <ul style="list-style-type: none"> <li>▪ 0 - The command shows the results only once and then stops (this is the default value).</li> <li>▪ 5 - The command shows the results every 5 seconds in the loop.</li> <li>▪ 30 - The command shows the results every 30 seconds in the loop.</li> <li>▪ N - The command shows the results every N seconds in the loop.</li> </ul> <p>Use this parameter together with the "<code>-c &lt;Count&gt;</code>" parameter and the "<code>-e &lt;Period&gt;</code>" parameter.</p> <p>Example:</p> <pre>cpstat os -f perf -o 2</pre>                                                                                                |
| <code>-c &lt;Count&gt;</code>            | <p>Optional.</p> <p>Specifies how many times the command runs and shows the results before it stops.</p> <p>You must use this parameter together with the "<code>-o &lt;Polling Interval&gt;</code>" parameter.</p> <p>Examples:</p> <ul style="list-style-type: none"> <li>▪ 0 - The command shows the results repeatedly every <code>&lt;Polling Interval&gt;</code> (this is the default value).</li> <li>▪ 10 - The command shows the results 10 times every <code>&lt;Polling Interval&gt;</code> and then stops.</li> <li>▪ 20 - The command shows the results 20 times every <code>&lt;Polling Interval&gt;</code> and then stops.</li> <li>▪ N - The command shows the results N times every <code>&lt;Polling Interval&gt;</code> and then stops.</li> </ul> <p>Example:</p> <pre>cpstat os -f perf -o 2 -c 2</pre> |

| Parameter                             | Description                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-e &lt;Period&gt;</code>        | <p>Optional.</p> <p>Specifies the time (in seconds), over which the command calculates the statistics.</p> <p>You must use this parameter together with the "<code>-o &lt;Polling Interval&gt;</code>" parameter.</p> <p>You can use this parameter together with the "<code>-c &lt;Count&gt;</code>" parameter.</p> <p>Example:</p> <pre>cpstat os -f perf -o 2 -c 2 -e 60</pre> |
| <code>&lt;Application Flag&gt;</code> | <p>Mandatory.</p> <p>See the table below with flavors for the application flags.</p>                                                                                                                                                                                                                                                                                              |

### These flavors are available for the application flags

 **Note** - The available flags depend on the enabled Software Blades. Some flags are supported only by a Security Gateway / ClusterXL, and some flags are supported only by a Management Server.

| Feature or Software Blade       | Flag   | Flavors                                                                                                                                                                                                                         |
|---------------------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

-----

[Expert@MGMT:0]#
```

# cpstop

## Description

Manually stops all Check Point processes and applications.

### Notes:

- For the `cprid` daemon, use the *"[cprid](#)" on page 186* command.
- For manually stopping specific Check Point processes, see [sk97638](#).

## Syntax

```
cpstop
```

# cpwd\_admin

## Description

The Check Point WatchDog (`cpwd`) is a process that invokes and monitors critical processes such as Check Point daemons on the local server, and attempts to restart them if they fail.

Among the processes monitored by Watchdog are `fwm`, `fwd`, `cpd`, `DAService`, and others.

The list of monitored processes depends on the installed and configured Check Point products and Software Blades.

The Check Point WatchDog writes monitoring information to the `$CPDIR/log/cpwd.elg` log file.

The `cpwd_admin` utility shows the status of the monitored processes, and configures the Check Point WatchDog.

## There are two types of Check Point WatchDog monitoring

| Monitoring | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Passive    | WatchDog restarts the process only when the process terminates abnormally.<br>In the output of the <code>cpwd_admin list</code> command, the <code>MON</code> column shows <code>N</code> for passively monitored processes.                                                                                                                                                                                                                               |
| Active     | WatchDog checks the process status every predefined interval.<br>WatchDog makes sure the process is alive, as well as properly functioning (not stuck on deadlocks, frozen, and so on).<br>In the output of the <code>cpwd_admin list</code> command, the <code>MON</code> column shows <code>Y</code> for actively monitored processes.<br>The list of actively monitored processes is predefined by Check Point.<br>Users cannot change or configure it. |

**Syntax on a Management Server in Gaia Clish or the Expert mode**

```
cpwd_admin
    config <options>
    del <options>
    detach <options>
    exist
    flist <options>
    getpid <options>
    kill
    list <options>
    monitor_list
    start <options>
    start_monitor
    stop <options>
    stop_monitor
```

**Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode**

```
cpwd_admin
    config <options>
    del <options>
    detach <options>
    exist
    flist <options>
    getpid <options>
    kill
    list <options>
    monitor_list
    start <options>
    start_monitor
    stop <options>
    stop_monitor
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpwd_admin
  config <options>
  del <options>
  detach <options>
  exist
  flist <options>
  getpid <options>
  kill
  list <options>
  monitor_list
  start <options>
  start_monitor
  stop <options>
  stop_monitor
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpwd_admin
  config <options>
  del <options>
  detach <options>
  exist
  flist <options>
  getpid <options>
  kill
  list <options>
  monitor_list
  start <options>
  start_monitor
  stop <options>
  stop_monitor
```

## Parameters

| Parameter           | Description                                                                                   |
|---------------------|-----------------------------------------------------------------------------------------------|
| config<br><options> | Configures the Check Point WatchDog.<br>See <a href="#">"cpwd_admin config" on page 224</a> . |

| Parameter           | Description                                                                                                                                                                                                                                                                                               |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| del<br><options>    | Temporarily deletes a monitored process from the WatchDog database of monitored processes.<br>See <a href="#">"cpwd_admin del" on page 229</a> .                                                                                                                                                          |
| detach<br><options> | Temporarily detaches a monitored process from the WatchDog monitoring.<br>See <a href="#">"cpwd_admin detach" on page 231</a> .                                                                                                                                                                           |
| exist               | Checks whether the WatchDog process cpwd is alive.<br>See <a href="#">"cpwd_admin exist" on page 233</a> .                                                                                                                                                                                                |
| flist<br><options>  | Saves the status of all monitored processes to a \$CPDIR/tmp/cpwd_list_<Epoch Timestamp>.lst file.<br>See <a href="#">"cpwd_admin flist" on page 234</a> .                                                                                                                                                |
| getpid<br><options> | Shows the PID of a monitored process.<br>See <a href="#">"cpwd_admin getpid" on page 236</a> .                                                                                                                                                                                                            |
| kill<br><options>   | Terminates the WatchDog process cpwd.<br>See <a href="#">"cpwd_admin kill" on page 237</a> .<br> <b>Important</b> - Do <b>not</b> run this command unless explicitly instructed by Check Point Support or R&D to do so. |
| list                | Prints the status of all monitored processes on the screen.<br>See <a href="#">"cpwd_admin list" on page 238</a> .                                                                                                                                                                                        |
| monitor_<br>list    | Prints the status of actively monitored processes on the screen.<br>See <a href="#">"cpwd_admin monitor_list" on page 243</a> .                                                                                                                                                                           |
| start<br><options>  | Starts a process as monitored by the WatchDog.<br>See <a href="#">"cpwd_admin start" on page 244</a> .                                                                                                                                                                                                    |
| start_<br>monitor   | Starts the active WatchDog monitoring - WatchDog monitors the predefined processes actively.<br>See <a href="#">"cpwd_admin start_monitor" on page 247</a> .                                                                                                                                              |
| stop<br><options>   | Stops a monitored process.<br>See <a href="#">"cpwd_admin stop" on page 248</a> .                                                                                                                                                                                                                         |
| stop_<br>monitor    | Stops the active WatchDog monitoring - WatchDog monitors all processes only passively.<br>See <a href="#">"cpwd_admin stop_monitor" on page 250</a> .                                                                                                                                                     |

## cpwd\_admin config

### Description

Configures the Check Point WatchDog.

-  **Important** - After changing the WatchDog configuration parameters, you must restart the WatchDog process with the "cpstop" and "cpstart" commands (which restart *all* Check Point processes).

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cpwd_admin config
  -h
  -a <options>
  -d <options>
  -p
  -r
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cpwd_admin config
  -h
  -a <options>
  -d <options>
  -p
  -r
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpwd_admin config
  -h
  -a <options>
  -d <options>
  -p
  -r
```

## Syntax on a Scalable Platform Security Group in the Expert mode

| Configuration Parameter | Accepted Values                                                                        | Description                                                                                                                                                                                                                                                      |
|-------------------------|----------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| zero_timeout            | <ul style="list-style-type: none"> <li>Range: &gt; 0</li> <li>Default: 7200</li> </ul> | <p>After failing <code>no_limit</code> times to restart a process, the WatchDog waits <code>zero_timeout</code> seconds before it tries again.</p> <p>The value of the <code>zero_timeout</code> must be greater than the value of the <code>timeout</code>.</p> |

The WatchDog saves the user defined configuration parameters in the `$CPDIR/registry/HKLM_registry.data` file in the " : (Wd\_Config" section:

```
("CheckPoint Repository Set"
 : (SOFTWARE
   : (CheckPoint
     : (CPshared
       :CurrentVersion (6.0)
       : (6.0
         ... ..
         : (reserved
           ... ..
           : (Wd
             : (Wd_Config
               :Configuration_Parameter_1 (" [4]Value_1"):Configuration_Parameter_2 ("
 [4]Value_2")
             )
           )
         ... ..
```

## Example

```
[Expert@HostName:0]# cpwd_admin config -p
cpWatchDog doesn't have configuration parameters
[Expert@HostName:0]#
[Expert@HostName:0]# cpwd_admin config -a sleep_timeout=120 no_limit=12
[Expert@HostName:0]#
[Expert@HostName:0]# cpwd_admin config -p
cpWatchDog Configuration parameters are:
sleep_timeout : 120
no_limit : 12
[Expert@HostName:0]#
[Expert@HostName:0]# cpstop ; cpstart
[Expert@HostName:0]#

[Expert@HostName:0]# cpwd_admin config -r
cpWatchDog doesn't have configuration parameters
[Expert@HostName:0]#
[Expert@HostName:0]# cpstop ; cpstart
[Expert@HostName:0]#
[Expert@HostName:0]# cpwd_admin config -p
cpWatchDog doesn't have configuration parameters
[Expert@HostName:0]#
```

# cpwd\_admin del

## Description

Temporarily deletes a monitored process from the WatchDog database of monitored processes.

### Notes:

- WatchDog stops monitoring the detached process, but the process stays alive.
- The "[cpwd\\_admin list](#)" on [page 238](#) command does not show the deleted process anymore.
- This change applies until all Check Point services restart during boot, or with the "[cpstart](#)" on [page 208](#) command.

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cpwd_admin del -name <Application Name>
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cpwd_admin del -name <Application Name> [-ctx <VSID>]
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpwd_admin del -name <Application Name> [-ctx <VSID>]
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpwd_admin del -name <Application Name> [-ctx <VSID>]
```

## Parameters

| Parameter                             | Description                                                                                                                                                                                                                                                                              |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;Application Name&gt;</code> | <p>Name of the monitored Check Point process as you see in the output of the <a href="#">"cpwd_admin list" on page 238</a> command in the leftmost column APP.</p> <p>Examples:</p> <ul style="list-style-type: none"> <li>■ FWM</li> <li>■ FWD</li> <li>■ CPD</li> <li>■ CPM</li> </ul> |
| <code>-ctx &lt;VSID&gt;</code>        | On a VSX Gateway, specifies the context of the applicable Virtual System.                                                                                                                                                                                                                |

## Example

```
[Expert@HostName:0]# cpwd_admin del -name FWD
cpwd_admin:
successful Del operation
[Expert@HostName:0]#
```

# cpwd\_admin detach

## Description

Temporarily detaches a monitored process from the WatchDog monitoring.

### Notes:

- WatchDog stops monitoring the detached process, but the process stays alive.
- The "[cpwd\\_admin list](#)" on [page 238](#) command does not show the detached process anymore.
- This change applies until all Check Point services restart during boot, or with the "[cpstart](#)" on [page 208](#) command.

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cpwd_admin detach -name <Application Name>
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cpwd_admin detach -name <Application Name> [-ctx <VSID>]
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpwd_admin detach -name <Application Name> [-ctx <VSID>]
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpwd_admin detach -name <Application Name> [-ctx <VSID>]
```

## Parameters

| Parameter                             | Description                                                                                                                                                                                                                                                              |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;Application Name&gt;</code> | Name of the monitored Check Point process as you see in the output of the <a href="#">"cpwd_admin list" on page 238</a> command in the leftmost column APP.<br>Examples: <ul style="list-style-type: none"><li>■ FWM</li><li>■ FWD</li><li>■ CPD</li><li>■ CPM</li></ul> |
| <code>-ctx &lt;VSID&gt;</code>        | On a VSX Gateway, specifies the context of the applicable Virtual System.                                                                                                                                                                                                |

## Example

```
[Expert@HostName:0]# cpwd_admin detach -name FWD
cpwd_admin:
successful Detach operation
[Expert@HostName:0]#
```

# cpwd\_admin exist

## Description

Checks whether the WatchDog process `cpwd` is alive.

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cpwd_admin exist
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cpwd_admin exist
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpwd_admin exist
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpwd_admin exist
```

## Example

```
[Expert@HostName:0]# cpwd_admin exist  
cpwd_admin: cpWatchDog is running  
[Expert@HostName:0]#
```

# cpwd\_admin flist

## Description

Saves the status of all WatchDog monitored processes to a file.

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cpwd_admin flist [-full]
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cpwd_admin flist [-full] [-ctx <VSID>]
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpwd_admin flist [-full] [-ctx <VSID>]
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpwd_admin flist [-full] [-ctx <VSID>]
```

## Parameters

| Parameter   | Description                                                               |
|-------------|---------------------------------------------------------------------------|
| -full       | Shows the verbose output.                                                 |
| -ctx <VSID> | On a VSX Gateway, specifies the context of the applicable Virtual System. |

## Output

| Column     | Description                                                                                                                                                                                                                       |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APP        | Shows the WatchDog name of the monitored process.                                                                                                                                                                                 |
| CTX        | On a VSX Gateway, shows the VSID, in which the monitored process runs.                                                                                                                                                            |
| PID        | Shows the PID of the monitored process.                                                                                                                                                                                           |
| STAT       | Shows the status of the monitored process: <ul style="list-style-type: none"> <li>▪ E - executing</li> <li>▪ T - terminated</li> </ul>                                                                                            |
| #START     | Shows how many times the WatchDog started the monitored process.                                                                                                                                                                  |
| START_TIME | Shows the time when the WatchDog started the monitored process for the last time.                                                                                                                                                 |
| SLP/LIMIT  | In verbose output, shows the values of the <code>sleep_timeout</code> and <code>no_limit</code> configuration parameters (see <a href="#">"cpwd_admin config" on page 224</a> ).                                                  |
| MON        | Shows how the WatchDog monitors this process (see the explanation for the <a href="#">"cpwd_admin" on page 220</a> ): <ul style="list-style-type: none"> <li>▪ Y - Active monitoring</li> <li>▪ N - Passive monitoring</li> </ul> |
| COMMAND    | Shows the command the WatchDog run to start this process.                                                                                                                                                                         |

## Example

```
[Expert@HostName:0]# cpwd_admin flist
/opt/CPshrd-R82.10/tmp/cpwd_list_1564617600.lst
[Expert@HostName:0]#
```

# cpwd\_admin getpid

## Description

Shows the PID of a WatchDog monitored process.

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cpwd_admin getpid -name <Application Name>
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cpwd_admin getpid -name <Application Name> [-ctx <VSID>]
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpwd_admin getpid -name <Application Name> [-ctx <VSID>]
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpwd_admin getpid -name <Application Name> [-ctx <VSID>]
```

## Parameters

| Parameter          | Description                                                                                                                                                                                                                                                                |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <Application Name> | Name of the monitored Check Point process as you see in the output of the " <a href="#">cpwd_admin list</a> " on page 238 command in the leftmost column APP.<br>Examples: <ul style="list-style-type: none"><li>■ FWM</li><li>■ FWD</li><li>■ CPD</li><li>■ CPM</li></ul> |
| -ctx <VSID>        | On VSX Gateway, specifies the context of the applicable Virtual System.                                                                                                                                                                                                    |

## Example

```
[Expert@HostName:0]# cpwd_admin getpid -name FWD
5640
[Expert@HostName:0]#
```

# cpwd\_admin kill

## Description

Terminates the WatchDog process `cpwd`.

**Important** - Do **not** run this command unless explicitly instructed by Check Point Support or R&D to do so.

To restart the WatchDog process, you must restart all Check Point services with the *"cpstop" on page 219* and *"cpstart" on page 208* commands.

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cpwd_admin kill
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cpwd_admin kill
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpwd_admin kill
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpwd_admin kill
```

# cpwd\_admin list

## Description

Prints the status of all WatchDog monitored processes on the screen.

**Note** - By default, WatchDog monitors a maximum of 10000 processes.

To increase this threshold, use the command "cpwd\_admin config -a num\_of\_procs=<value>".

See "[cpwd\\_admin config](#)" on page 224.

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cpwd_admin list [-full]
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cpwd_admin list [-full] [-ctx <VSID>]
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpwd_admin list [-full] [-ctx <VSID>]
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpwd_admin list [-full] [-ctx <VSID>]
```

## Parameters

| Parameter   | Description                                                               |
|-------------|---------------------------------------------------------------------------|
| -full       | Shows the verbose output.                                                 |
| -ctx <VSID> | On a VSX Gateway, specifies the context of the applicable Virtual System. |

## Output

| Column     | Description                                                                                                                                                                                                                       |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APP        | Shows the WatchDog name of the monitored process.                                                                                                                                                                                 |
| CTX        | On a VSX Gateway, shows the VSID, in which the monitored process runs.                                                                                                                                                            |
| PID        | Shows the PID of the monitored process.                                                                                                                                                                                           |
| STAT       | Shows the status of the monitored process: <ul style="list-style-type: none"> <li>▪ E - executing</li> <li>▪ T - terminated</li> </ul>                                                                                            |
| #START     | Shows how many times the WatchDog started the monitored process.                                                                                                                                                                  |
| START_TIME | Shows the time when the WatchDog started the monitored process for the last time.                                                                                                                                                 |
| SLP/LIMIT  | In verbose output, shows the values of the <code>sleep_timeout</code> and <code>no_limit</code> configuration parameters (see <a href="#">"cpwd_admin config" on page 224</a> ).                                                  |
| MON        | Shows how the WatchDog monitors this process (see the explanation for the <a href="#">"cpwd_admin" on page 220</a> ): <ul style="list-style-type: none"> <li>▪ Y - Active monitoring</li> <li>▪ N - Passive monitoring</li> </ul> |
| COMMAND    | Shows the command the WatchDog run to start this process.                                                                                                                                                                         |

## Examples

### Example - Default output on a Management Server

```
[Expert@HostName:0]# cpwd_admin list

```
[Expert@HostName:0]#
```

# cpwd\_admin monitor\_list

## Description

Prints the status of actively monitored processes on the screen.

See the explanation about the active monitoring in ["cpwd\\_admin" on page 220](#).

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cpwd_admin monitor_list
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cpwd_admin monitor_list
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpwd_admin monitor_list
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpwd_admin monitor_list
```

## Example

```
[Expert@HostName:0]# cpwd_admin monitor_list
cpwd_admin:
APP      FILE_NAME                NO_MSG_TIMES  LAST_MSG_TIME
CPD      CPD_5420_4714.mntr             0/10          [19:00:33] 31/5/2019
[Expert@HostName:0]#
```

# cpwd\_admin start

## Description

Starts a process as monitored by the WatchDog.

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cpwd_admin start -name <Application Name> -path "<Full Path to Executable>" -command "<Command Syntax>" [-env {inherit | <Env_Var>=<Value>}] [-slp_timeout <Timeout>] [-retry_limit {<Limit> | u}]
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cpwd_admin start -name <Application Name> [-ctx <VSID>] -path "<Full Path to Executable>" -command "<Command Syntax>" [-env {inherit | <Env_Var>=<Value>}] [-slp_timeout <Timeout>] [-retry_limit {<Limit> | u}]
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpwd_admin start -name <Application Name> [-ctx <VSID>] -path "<Full Path to Executable>" -command "<Command Syntax>" [-env {inherit | <Env_Var>=<Value>}] [-slp_timeout <Timeout>] [-retry_limit {<Limit> | u}]
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpwd_admin start -name <Application Name> [-ctx <VSID>] -path "<Full Path to Executable>" -command "<Command Syntax>" [-env {inherit | <Env_Var>=<Value>}] [-slp_timeout <Timeout>] [-retry_limit {<Limit> | u}]
```

## Parameters

| Parameter                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Example

For the list of process and the applicable syntax, see [sk97638](#).

# cpwd\_admin start\_monitor

## Description

Starts the active WatchDog monitoring. WatchDog monitors the predefined processes actively.

See the explanation for the ["cpwd\\_admin" on page 220](#) command.

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cpwd_admin start_monitor
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cpwd_admin start_monitor
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpwd_admin start_monitor
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpwd_admin start_monitor
```

## Example

```
[Expert@HostName:0]# cpwd_admin start_monitor
cpwd_admin:
CPWD has started to perform active monitoring on Check Point services/processes
[Expert@HostName:0]#
```

# cpwd\_admin stop

## Description

Stops a WatchDog monitored process.

**Important** - This change does **not** survive reboot.

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cpwd_admin stop -name <Application Name> [-path "<Full Path to Executable>" -command "<Command Syntax>" [-env {inherit | <Env_Var>=<Value>}]
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cpwd_admin stop -name <Application Name> [-ctx <VSID>] [-path "<Full Path to Executable>" -command "<Command Syntax>" [-env {inherit | <Env_Var>=<Value>}]
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpwd_admin stop -name <Application Name> [-ctx <VSID>] [-path "<Full Path to Executable>" -command "<Command Syntax>" [-env {inherit | <Env_Var>=<Value>}]
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpwd_admin stop -name <Application Name> [-ctx <VSID>] [-path "<Full Path to Executable>" -command "<Command Syntax>" [-env {inherit | <Env_Var>=<Value>}]
```

## Parameters

| Parameter                                                   | Description                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-name &lt;Application Name&gt;</code>                 | <p>Name under which the <code>cpwd_admin list</code> command shows the monitored process in the leftmost column APP.</p> <p>Examples:</p> <ul style="list-style-type: none"> <li>■ FWM</li> <li>■ FWD</li> <li>■ CPD</li> <li>■ CPM</li> </ul>                                                                                                                                |
| <code>-ctx &lt;VSID&gt;</code>                              | <p>On a VSX Gateway, specifies the context of the applicable Virtual System.</p>                                                                                                                                                                                                                                                                                              |

| <code>-env {inherit   &lt;Env_Var&gt;=&lt;Value&gt;}</code> | <p>Configures whether to inherit the environment variables from the shell.</p> <ul style="list-style-type: none"> <li>■ <code>inherit</code> - Inherits all the environment variables (WatchDog supports up to 80 environment variables)</li> <li>■ <code>&lt;Env_Var&gt;=&lt;Value&gt;</code> - Assigns the specified value to the specified environment variable</li> </ul> |

## Example

For the list of process and the applicable syntax, see [sk97638](#).

# cpwd\_admin stop\_monitor

## Description

Stops the active WatchDog monitoring. WatchDog monitors all processes only passively.

See the explanation for the ["cpwd\\_admin" on page 220](#) command.

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cpwd_admin stop_monitor
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cpwd_admin stop_monitor
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpwd_admin stop_monitor
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpwd_admin stop_monitor
```

## Example

```
[Expert@HostName:0]# cpwd_admin stop_monitor
cpwd_admin:
CPWD has stopped performing active monitoring on Check Point services/processes
[Expert@HostName:0]#
```

# dbedit

## Description

Edits the management database - the `$FWDIR/conf/objects_5_0.C` file - on the Security Management Server or Domain Management Server. See [sk13301](#).

**Important** - Do NOT run this command, unless explicitly instructed by Check Point Support or R&D to do so. Otherwise, you can corrupt settings in the management database.

## Syntax

```
dbedit -help
```

```
dbedit [-globallock] [{-local | -s <Management_Server>}] [{-u
<Username> | -c <Certificate>}] [-p <Password>] [-f <File_Name>
[ignore_script_failure] [-continue_updating]] [-r "<Open_Reason_
Text>"] [-d <Database_Name>] [-listen] [-readonly] [-session]
```

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsend <IP Address or Name of Domain Management Server>
```

## Parameters

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -help       | Prints the general help.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| -globallock | When you work with the dedit utility, it partially locks the management database. If a user configures objects in SmartConsole at the same time, it causes problems in the management database. This option does not let SmartConsole, or a dedit user to make changes in the management database. When you specify this option, the dedit commands run on a copy of the management database. After you make the changes with the dedit commands and run the savedb command, the dedit utility saves and commits your changes to the actual management database. |
| -local      | Connects to the localhost (127.0.0.1) without using username/password. If you do not specify this parameter, the dedit utility asks how to connect.                                                                                                                                                                                                                                                                                                                                                                                                              |

| Parameter                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -s<br><Management_<br>Server>   | Specifies the Security Management Server - by IP address or HostName.<br>If you do not specify this parameter, the dbedit utility asks how to connect.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| -u<br><Username>                | Specifies the username, with which the dbedit utility connects to the Security Management Server.<br>Mandatory parameter when you specify the "-s <Management_<br>Server>" parameter.                                                                                                                                                                                                                                                                                                                                                                                                         |
| -c<br><Certificate<br>>         | Specifies the user's certificate file, with which the dbedit utility connects to the Security Management Server.<br>Mandatory parameter when you specify the "-s <Management_<br>Server>" parameter.                                                                                                                                                                                                                                                                                                                                                                                          |
| -p<br><Password>                | Specifies the user's password, with which the dbedit utility connects to the Security Management Server.<br>Mandatory parameter when you specify the "-s <Management_<br>Server>" and "-u <Username>" parameters.                                                                                                                                                                                                                                                                                                                                                                             |
| -f <File_<br>Name>              | Specifies the file that contains the applicable dbedit internal commands (see the section " <i>dbedit Internal Commands</i> " below): <ul style="list-style-type: none"> <li>■ create &lt;object_type&gt; &lt;object_name&gt;</li> <li>■ modify &lt;table_name&gt; &lt;object_name&gt; &lt;field_name&gt; &lt;value&gt;</li> <li>■ update &lt;table_name&gt; &lt;object_name&gt;</li> <li>■ delete &lt;table_name&gt; &lt;object_name&gt;</li> <li>■ print &lt;table_name&gt; &lt;object_name&gt;</li> <li>■ quit</li> </ul> <p><b>Note</b> - Each command is limited to 4096 characters.</p> |
| ignore_<br>script_<br>failure   | Continues to execute the dbedit internal commands in the file and ignores errors.<br>You can use it when you specify the "-f <File_Name>" parameter.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| -continue_<br>updating          | Continues to update the modified objects, even if the operation fails for some of the objects (ignores the errors and runs the <code>update_all</code> command at the end of the script).<br>You can use it when you specify the "-f <File_Name>" parameter.                                                                                                                                                                                                                                                                                                                                  |
| -r "<Open_<br>Reason_<br>Text>" | Specifies the reason for opening the database in read-write mode (default mode).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Parameter             | Description                                                                                                                                                                                                                           |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d<br><Database_Name> | Specifies the name of the database, to which the dbedit utility should connect (for example, mdsdb).                                                                                                                                  |
| -listen               | The dbedit utility "listens" for changes (use this mode for advanced troubleshooting with the assistance of Check Point Support).<br>The dbedit utility prints its internal messages when a change occurs in the management database. |
| -readonly             | Specifies to open the management database in read-only mode.                                                                                                                                                                          |
| -session              | Session Connectivity.                                                                                                                                                                                                                 |

### dbedit Internal Commands

 **Note** - To see the available tables, class names (object types), attributes and values, connect to Management Server with Database Tool (GuiDBEdit Tool) (see [sk13009](#)).

| Command    | Description, Syntax, Examples                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -h         | <p><b>Description:</b><br/>Prints the general help.</p> <p><b>Syntax:</b></p> <pre>dbedit&gt; -h</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

# evstart

## Description

- On a dedicated SmartEvent Server or on a Security Management Server with the enabled SmartEvent Server and SmartEvent Correlation Unit Software Blades, this command:
- Starts the SmartEvent Server and the SmartEvent Correlation Unit services, if you stopped them with the "evstop" command (see ["evstop" on page 265](#)).
  - Starts only the SmartEvent Correlation Unit service, if you stopped it with the "evstop" command (see ["evstop" on page 265](#)).

 **Important:**

- You can run this command only in the Expert mode.
- SmartEvent Server runs this command automatically:
  - During boot.
  - When you run the "cpstart" command (see ["cpstart" on page 208](#)).

## Related command

["evstop" on page 265](#)

## Syntax

```
evstart [-analyzer]
```

## Parameters

| Parameter     | Description                                                                |
|---------------|----------------------------------------------------------------------------|
| No Parameters | Starts the SmartEvent Server and the SmartEvent Correlation Unit services. |
| -analyzer     | Starts only the SmartEvent Correlation Unit service.                       |

# evstop

## Description

On a dedicated SmartEvent Server or on a Security Management Server with the enabled SmartEvent Server and SmartEvent Correlation Unit Software Blades, this command:

- Stops the SmartEvent Server and the SmartEvent Correlation Unit services.
- Stops only the SmartEvent Correlation Unit service.

### Important:

- You can run this command only in the Expert mode.
- SmartEvent Server runs this command automatically:
  - When you run the "cpstop" command (see ["cpstop" on page 219](#)).
  - During reboot or shutdown.

## Related command

["evstart" on page 264](#)

## Syntax

```
evstop [-analyzer]
```

## Parameters

| Parameter     | Description                                                               |
|---------------|---------------------------------------------------------------------------|
| No Parameters | Stops the SmartEvent Server and the SmartEvent Correlation Unit services. |
| -analyzer     | Stops only the SmartEvent Correlation Unit service.                       |

# fw

## Description

- Performs various operations on Security or Audit log files.
- Kills the specified Check Point processes.
- Manages the Suspicious Activity Monitoring (SAM) rules.
- Manages the Suspicious Activity Policy editor.

## Syntax

```
fw [-d]
    fetchlogs <options>
    hastat <options>
    kill <options>
    log <options>
    logswitch <options>
    lslogs <options>
    mergefiles <options>
    repairlog <options>
    sam <options>
    sam_policy <options>
```

## Parameters

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                     | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| fetchlogs<br><options> | Fetches the specified Check Point log files - Security (\$FWDIR/log/*.log*) or Audit (\$FWDIR/log/*.adtlog*), from the specified Check Point server.<br>See <a href="#">"fw fetchlogs" on page 268</a> .                                                                                                                                   |
| hastat<br><options>    | Shows information about Check Point servers in High Availability configuration and their states.<br>See <a href="#">"fw hastat" on page 272</a> .                                                                                                                                                                                          |

| Parameter                                          | Description                                                                                                                                                                                                                                                          |

# fw fetchlogs

## Description

Fetches the specified Security log files (\$FWDIR/log/\*.log\*) or Audit log files (\$FWDIR/log/\*.adtlog\*) from the specified Check Point server.

 **Important** - You can run this command in the Expert mode or in Gaia Clish (Gaia gClish on Scalable Platforms).

## Syntax

```
fw [-d] fetchlogs [-f <Name of Log File 1>] [-f <Name of Log File 2>]... [-f <Name of Log File N>] <Target>
```

## Parameters

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                      | <p>Runs the command in debug mode.</p> <p>Use only if you troubleshoot the command itself.</p> <p>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| -f <Name of Log File N> | <p>Specifies the name of the log file to fetch. Need to specify name only.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>■ If you do not specify the log file name explicitly, the command transfers all Security log files (\$FWDIR/log/*.log*) and all Audit log files (\$FWDIR/log/*.adtlog*).</li> <li>■ The specified log file name can include wildcards * and ? (for example, 2017-0?-*.log).<br/>If you enter a wildcard, you must enclose it in double quotes or single quotes.</li> <li>■ You can specify multiple log files in one command.<br/>You must use the -f parameter for each log file name pattern.</li> <li>■ This command also transfers the applicable log pointer files.</li> </ul> |
| <Target>                | <p>Specifies the remote Check Point server, with which this local Check Point server has established SIC trust.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>■ The local and the remote servers must have established SIC trust.</li> <li>■ The local server can be a Security Management Server, a Log Server, a Cluster Member.</li> <li>■ The remote server can be a Security Gateway, a Cluster Member, a Log Server, or a Security Management Server in High Availability deployment.</li> <li>■ You can specify the remote managed server by its main IP address or Object Name as configured in SmartConsole.</li> </ul>                                                                             |

**Notes:**

- This command moves the specified log files from the `$FWDIR/log/` directory on the specified Check Point server.

Meaning, it deletes the specified log files on the specified Check Point server after it copies them successfully.

- This command moves the specified log files to the `$FWDIR/log/` directory on the local Check Point server, on which you run this command.
- This command cannot fetch the *active* log files `$FWDIR/log/fw.log` or `$FWDIR/log/fw.adtlog`.

To fetch these active log files:

1. Perform the log switch on the applicable Check Point server:

See "[fw logswitch](#)" on page 284.

```
fw logswitch [-audit] [-h <IP Address or Hostname>]
```

2. Fetch the rotated log file from the applicable Check Point server:

```
fw fetchlogs -f <Log File Name> <IP Address or Hostname>
```

- This command renames the log files it fetched from the specified Check Point server.

The new log file name is the concatenation of these:

- The Check Point server's name (as configured in SmartConsole).
- Two underscore (\_\_) characters.
- The original log file name

**Example:** `MyGW__2019-06-01_000000.log`

## Example - Fetching log files from a Management Server

```
[Expert@HostName:0]# fw lslogs MyGW
Size Log file name
 23KB 2019-05-16_000000.log
  9KB 2019-05-17_000000.log
 11KB 2019-05-18_000000.log
5796KB 2019-06-01_000000.log
4610KB fw.log
[Expert@HostName:0]#

[Expert@HostName:0]# fw fetchlogs -f 2019-06-01_000000 MyGW
File fetching in process. It may take some time...
File MyGW__2019-06-01_000000.log was fetched successfully
[Expert@HostName:0]#

[Expert@HostName:0]# ls $FWDIR/log/MyGW*
/opt/CPsuite-R82.10/fw1/log/MyGW__2019-06-01_000000.log
/opt/CPsuite-R82.10/fw1/log/MyGW__2019-06-01_000000.logaccount_ptr
/opt/CPsuite-R82.10/fw1/log/MyGW__2019-06-01_000000.loginitial_ptr
/opt/CPsuite-R82.10/fw1/log/MyGW__2019-06-01_000000.logptr
[Expert@HostName:0]#

[Expert@HostName:0]# fw lslogs MyGW
Size Log file name
 23KB 2019-05-16_000000.log
  9KB 2019-05-17_000000.log
 11KB 2019-05-18_000000.log
4610KB fw.log
[Expert@HostName:0]#
```

# fw hastat

## Description

Shows information about Check Point computers in High Availability configuration and their states.

-  **Note** - This command is outdated. On cluster members, run the Gaia Clish command "show cluster state", or the Expert mode command "cphaprob state".
-  **Note** - This command is outdated. On Management Servers, run the ["cpstat" on page 209](#) command.

## Syntax

```
fw hastat [<Target1>] [<Target2>] ... [<TargetN>]
```

## Parameters

| Parameter                               | Description                                                                                                                                                                                                                                                                                            |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <Target1><br><Target2> ...<br><TargetN> | Specifies the Check Point computers to query.<br>If you run this command on the Management Server, you can enter the applicable IP address, or the resolvable HostName of the managed Security Gateway or Cluster Member.<br>If you do not specify the target, the command queries the local computer. |

## Example - Querying the cluster members from the Management Server

```
[Expert@MGMT:0]# fw hastat 192.168.3.52
HOST NUMBER HIGH AVAILABILITY STATE MACHINE STATUS
192.168.3.52 1 active OK
[Expert@MGMT:0]#

[Expert@MGMT:0]# fw hastat 192.168.3.53
HOST NUMBER HIGH AVAILABILITY STATE MACHINE STATUS
192.168.3.53 2 stand-by OK
[Expert@MGMT:0]#

[Expert@MGMT:0]# fw hastat 192.168.3.52 192.168.3.53
HOST NUMBER HIGH AVAILABILITY STATE MACHINE STATUS
192.168.3.52 1 active OK
192.168.3.53 2 stand-by OK
[Expert@MGMT:0]#
```

## Example - Querying the local Cluster Member

```
[Expert@Member1:0]# fw hastat
HOST NUMBER HIGH AVAILABILITY STATE MACHINE STATUS
192.168.3.52 1 active OK
[Expert@Member1:0]#
```

# fw kill

## Description

Kills the specified Check Point processes.

### Important:

- Make sure the killed process is restarted, or restart it manually. See [sk97638](#).
- You can run this command in the Expert mode or in Gaia Clish (Gaia gClish on Scalable Platforms).

## Syntax

```
fw [-d] kill [-t <Signal Number>] <Name of Process>
```

## Parameters

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                 | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.                                                                               |
| -t <Signal Number> | Specifies which signal to send to the Check Point process.<br>For the list of available signals and their numbers, run the <code>kill -l</code> command.<br>For information about the signals, see the manual pages for the <a href="#">kill</a> and <a href="#">signal</a> .<br>If you do not specify the signal explicitly, the command sends Signal 15 (SIGTERM).<br><b>Note</b> - Processes can ignore some signals. |
| <Name of Process>  | Specifies the name of the Check Point process to kill.<br>To see the names of the processes, run the <code>ps auxwf</code> command.                                                                                                                                                                                                                                                                                      |

## Example

```
fw kill fwd
```

# fw log

## Description

Shows the content of Check Point log files - Security (\$FWDIR/log/\*.log) or Audit (\$FWDIR/log/\*.adtlog).

 **Important** - You can run this command in the Expert mode or in Gaia Clish (Gaia gClish on Scalable Platforms).

## Syntax

```
fw log {-h | -help}
```

```
fw [-d] log [-a] [-b "<Start Timestamp>" "<End Timestamp>"] [-c
<Action>] [{-f | -t}] [-g] [-H] [-h <Origin>] [-i] [-k {<Alert
Name> | all}] [-l] [-m {initial | semi | raw}] [-n] [-o] [-p] [-q]
[-S] [-s "<Start Timestamp>"] [-e "<End Timestamp>"] [-u
<Unification Scheme File>] [-w] [-x <Start Entry Number>] [-y <End
Entry Number>] [-z] [-#] [<Log File>]
```

## Parameters

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {-h   -help} | Shows the built-in usage.<br><b>Note</b> - The built-in usage does not show some of the parameters described in this table.                                                                                                                                                                                                                |
| -d           | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| -a           | Shows only Account log entries.                                                                                                                                                                                                                                                                                                            |

| Parameter                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-b "&lt;Start Timestamp&gt;" "&lt;End Timestamp&gt;"</code> | <p>Shows only entries that were logged between the specified start and end times.</p> <ul style="list-style-type: none"> <li>■ The <code>&lt;Start Timestamp&gt;</code> and <code>&lt;End Timestamp&gt;</code> may be a date, a time, or both.</li> <li>■ If date is omitted, then the command assumes the current date.</li> <li>■ Enclose the <code>"&lt;Start Timestamp&gt;"</code> and <code>"&lt;End Timestamp&gt;"</code> in single or double quotes (<code>-b 'XX' 'YY'</code>, or <code>-b "XX" "YY"</code>).</li> <li>■ You cannot use the <code>-b</code> parameter together with the <code>-s</code> or <code>-e</code> parameters.</li> <li>■ See the date and time format below.</li> </ul> |
| <code>-c &lt;Action&gt;</code>                                    | <p>Shows only events with the specified action. | -#                                 | Show confidential logs in clear text.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <Log File>                         | <p>Specifies the log file to read.</p> <p>If you do not specify the log file explicitly, the command opens the <code>\$FWDIR/log/fw.log</code> log file.</p> <p>You can specify a switched log file.</p>                                                                                                                                                                                                                                                                                |

## Date and Time format

| Part of timestamp                                                       | Format                   | Example                   |
|-------------------------------------------------------------------------|--------------------------|---------------------------|
| Date only                                                               | MMM DD, YYYY             | June 11, 2018             |
| Time only<br>Note - In this case, the command assumes the current date. | HH:MM:SS                 | 14:20:00                  |
| Date and Time                                                           | MMM DD, YYYY<br>HH:MM:SS | June 11, 2018<br>14:20:00 |

## Output

Each output line consists of a single log entry, whose fields appear in this format:

**Note** - The fields that show depends on the connection type.

```
HeaderDateHour ContentVersion HighLevelLogKey Uuid SequenceNum
Flags Action Origin IfDir InterfaceName LogId ...
```

This table describes some of the fields.

| Field Header    | Description         | Example                                   |
|-----------------|---------------------|-------------------------------------------|
| HeaderDateHour  | Date and Time       | 12Jun2018 12:56:42                        |
| ContentVersion  | Version             | 5                                         |
| HighLevelLogKey | High Level Log Key  | <max_null>, or empty                      |
| Uuid            | Log UUID            | (0x5b1f99cb, 0x0, 0x3403a8c0, 0xc0000000) |
| SequenceNum     | Log Sequence Number | 1                                         |

| Field Header | Description                                                                                                                                                                                      | Example                                                                                                                                                                                                                                       |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Flags        | Internal flags that specify the "nature" of the log - for example, control, audit, accounting, complementary, and so on                                                                          | 428292                                                                                                                                                                                                                                        |
| Action       | Action performed on this connection                                                                                                                                                              | <ul style="list-style-type: none"> <li>■ accept</li> <li>■ dropreject</li> <li>■ encrypt</li> <li>■ decrypt</li> <li>■ vpnroute</li> <li>■ keyinst</li> <li>■ authorize</li> <li>■ deauthorize</li> <li>■ authcrypt</li> <li>■ ctl</li> </ul> |

| ProductFamily | Name of the Check Point product family that generated this log   | Network                                                                                                                          |

## Examples

### Example 1 - Show all log entries with both the date and the time for each log entry

```
fw log -l
```

### Example 2 - Show all log entries that start after the specified timestamp

```
[Expert@MyGW:0]# fw log -l -s "June 12, 2018 12:33:00"
12Jun2018 12:33:00 5 N/A 1 accept MyGW > N/A LogId: <max_null>; ContextNum: <max_null>; OriginSicName: CN=MyGW,O=MyDomain_
Server.checkpoint.com.s6t98x; fg-1_client_in_rule_name: Default; fg-1_client_out_rule_name: Default; fg-1_server_in_rule_name: Host
Redirect; fg-1_server_out_rule_name: ; ProductName: FG; ProductFamily: Network;

12Jun2018 12:33:39 5 N/A 1 drop MyGW < eth0 LogId: 0; ContextNum: <max_null>; OriginSicName: CN=MyGW,O=MyDomain_
Server.checkpoint.com.s6t98x; inzone: Local; outzone: External; service_id: ftp; src: MyGW; dst: MyFTPServer; proto: tcp; UP_match_
table: TABLE_START; ROW_START: 0; match_id: 2; layer_uid: 4e26fc30-b345-4c96-b8d7-9db6aa7cdd89; layer_name: MyPolicy Network; rule_

ProductFamily: Network;
[Expert@MyGW:0]#
```

### Example 5 - Show all log entries with action "drop", show all field headers, and show log flags

```
[Expert@MyGW:0]# fw log -l -q -w -c drop
HeaderDateHour: 12Jun2018 12:33:39; ContentVersion: 5; HighLevelLogKey: <max_null>; LogUid: ; SequenceNum: 1; Flags: 428292; Action:
drop; Origin: MyGW; IfDir: <; InterfaceName: eth0; Alert: ; LogId: 0; ContextNum: <max_null>; OriginSicName: CN=MyGW,O=MyDomain_
Server.checkpoint.com.s6t98x; inzone: Local; outzone: External; service_id: ftp; src: MyGW; dst: MyFTPServer; proto: tcp; UP_match_
table: TABLE_START; ROW_START: 0; match_id: 2; layer_uuid: 4e26fc30-b345-4c96-b8d7-9db6aa7cdd89; layer_name: MyPolicy Network; rule_
uid: 802020d9-5cdc-4c74-8e92-47e1b0eb72e5; rule_name: ; ROW_END: 0; UP_match_table: TABLE_END; UP_action_table: TABLE_START; ROW_
START: 0; action: 0; ROW_END: 0; UP_action_table: TABLE_END; ProductName: VPN-1 & FireWall-1; svc: ftp; sport_svc: 64933;
ProductFamily: Network;
[Expert@MyGW:0]#
```

### Example 6 - Show only log entries from 0 to 10 (counting from the beginning of the log file)

```
[Expert@MyGW:0]# fw log -l -x 0 -y 10
... ..
[Expert@MyGW:0]#
```

# fw logswitch

## Description

Switches the current active log file:

1. Closes the current active log file.
2. Renames the current active log file.
3. Creates a new active log file with the default name.

### Notes:

- By default, this command switches the active Security log file - `$FWDIR/log/fw.log`
- You can specify to switch the active Audit log file - `$FWDIR/log/fw.adtlog`

 **Important** You can run this command in the Expert mode or in Gaia Clish (Gaia gClish on Scalable Platforms).

## Syntax

```
fw [-d] logswitch
    [-audit] [<Name of Switched Log>]
    -h <Target> [[+ | -]<Name of Switched Log>]
```

## Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d        | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| -audit    | Specifies to switch the active Audit log file ( <code>\$FWDIR/log/fw.adtlog</code> ).<br>You can use this parameter only on a Management Server.                                                                                                                                                                                           |

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -         | <p>Specifies to <i>transfer</i> the active log from the remote server to the local server.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>■ The command saves the copied active log file in the <code>\$FWDIR/log/</code> directory on the local server and then deletes the switched log file on the remote server.</li> <li>■ If you specify the name of the switched log file, you must write it immediately after this - (minus) parameter.</li> <li>■ The default name of the saved log file is:<br/> <code>&lt;Gateway_Object_Name&gt;__&lt;YYYY-MM-DD_HHMMSS&gt;.log</code><br/> For example, <code>MyGW__2018-03-26_174455.log</code></li> <li>■ If you specify the name of the switched log file, then the name of the saved log file is:<br/> <code>&lt;Gateway_Object_Name&gt;__&lt;Specified_Log_Name&gt;.log</code></li> <li>■ When this command transfers the log file from the remote server, it compresses the file.</li> <li>■ As an alternative, you can use the <a href="#">"fw fetchlogs" on page 268</a> command.</li> </ul> |

## Compression

When this command transfers the log files from the remote server, it compresses the file with the `gzip` command (see RFC 1950 to RFC 1952 for details). The algorithm is a variation of LZ77 method. The compression ratio varies with the content of the log file and is difficult to predict. Binary data are not compressed. Text data, such as user names and URLs, are compressed.

### Example - Switching the active Security log on a Security Management Server or Security Gateway

```
[Expert@MGMT:0]# fw logswitch
Log file has been switched to: 2018-06-13_182359.log
[Expert@MGMT:0]#
```

### Example - Switching the active Audit log on a Security Management Server

```
[Expert@MGMT:0]# fw logswitch -audit
Log file has been switched to: 2018-06-13_185711.adtlog
[Expert@MGMT:0]#
```

**Example - Switching the active Security log on a managed Security Gateway and copying the switched log**

```
[Expert@MGMT:0]# fw logswitch -h MyGW +
Log file has been switched to: 2018-06-13_185451.log
[Expert@MGMT:0]#
[Expert@MGMT:0]# ls $FWDIR/log/*.log
/opt/CPsuite-R82.10/fw1/log/fw.log
/opt/CPsuite-R82.10/fw1/log/MyGW__2018-06-13_185451.log
[Expert@MGMT:0]#

[Expert@MyGW:0]# ls $FWDIR/log/*.log
/opt/CPsuite-R82.10/fw1/log/fw.log
/opt/CPsuite-R82.10/fw1/log/2018-06-13_185451.log
[Expert@MyGW:0]#
```

# fw lslogs

## Description

Shows a list of Security log files (`$FWDIR/log/*.log`) and Audit log files (`$FWDIR/log/*.adtlog`) residing on the local server or a remote server.

 **Important** - You can run this command in the Expert mode or in Gaia Clish (Gaia gClish on Scalable Platforms).

## Syntax

```
fw [-d] lslogs [-f <Name of Log File 1>] [-f <Name of Log File 2>]
... [-f <Name of Log File N>] [-e] [-r] [-s {name | size | stime |
etime}] [<Target>]
```

## Parameters

| Parameter                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-d</code>                          | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p>                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>-f &lt;Name of Log File&gt;</code> | <p>Specifies the name of the log file to show.<br/>Need to specify only the name.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>■ If the log file name is not specified explicitly, the command shows all Security log files (<code>\$FWDIR/log/*.log</code>).</li> <li>■ File names may include <code>*</code> and <code>?</code> as wildcards (for example, <code>2019-0?-*</code>).<br/>If you enter a wildcard, you must enclose it in double quotes or single quotes.</li> <li>■ You can specify multiple log files in one command.<br/>You must use the <code>-f</code> parameter for each log file name pattern:<br/> <pre>-f &lt;Name of Log File 1&gt; -f &lt;Name of Log File 2&gt; ... -f &lt;Name of Log File N&gt;</pre> </li> </ul> |

| Parameter                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-e</code>                               | Shows an extended file list. It includes the following information for each log file: <ul style="list-style-type: none"> <li>■ <code>Size</code> - The total size of the log file and its related pointer files</li> <li>■ <code>Creation Time</code> - The time the log file was created</li> <li>■ <code>Closing Time</code> - The time the log file was closed</li> <li>■ <code>Log File Name</code> - The file name</li> </ul>                                                                                                                                                                                                                              |
| <code>-r</code>                               | Reverses the sort order (descending order).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <code>-s {name   size   stime   etime}</code> | Specifies the sort order of the log files using one of the following sort options: <ul style="list-style-type: none"> <li>■ <code>name</code> - The file name</li> <li>■ <code>size</code> - The file size</li> <li>■ <code>stime</code> - The time the log file was created (this is the default option)</li> <li>■ <code>etime</code> - The time the log file was closed</li> </ul>                                                                                                                                                                                                                                                                           |
| <code>&lt;Target&gt;</code>                   | Specifies the remote Check Point server, with which this local Check Point server has established SIC trust. <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>■ The local and the remote servers must have established SIC trust.</li> <li>■ The local server can be a Security Management Server, a Log Server, a Security Gateway, a Cluster Member.</li> <li>■ The remote server can be a Security Gateway, a Cluster Member, a Log Server, or a Security Management Server in High Availability deployment.</li> <li>■ You can specify the remote managed server by its main IP address or Object Name as configured in SmartConsole.</li> </ul> |

### Example 1 - Default output

```
[Expert@HostName:0]# fw lslogs
  Size Log file name
    9KB 2019-06-14_000000.log
   11KB 2019-06-15_000000.log
    9KB 2019-06-16_000000.log
   10KB 2019-06-17_000000.log
    9KB fw.log
[Expert@HostName:0]#
```

**Example 2 - Showing all log files**

```
[Expert@HostName:0]# fw lslogs -f ""
Size Log file name
9KB fw.adtlog
9KB fw.log
9KB 2019-05-29_000000.adtlog
9KB 2019-05-29_000000.log
9KB 2019-05-20_000000.adtlog
9KB 2019-05-20_000000.log
[Expert@HostName:0]#
```

**Example 3 - Showing only log files specified by the patterns**

```
[Expert@HostName:0]# fw lslogs -f "2019-06-14*" -f '2019-06-15*'
Size Log file name
9KB 2019-06-14_000000.adtlog
9KB 2019-06-14_000000.log
11KB 2019-06-15_000000.adtlog
11KB 2019-06-15_000000.log
[Expert@HostName:0]#
```

**Example 4 - Showing only log files specified by the patterns and their extended information**

```
[Expert@HostName:0]# fw lslogs -f "2019-06-14*" -f '2019-06-15*'
Size Log file name
9KB 2019-06-14_000000.adtlog
9KB 2019-06-14_000000.log

[Expert@MGMT:0]#
```

# fw mergefiles

## Description

Merges several Security log files (`$FWDIR/log/*.log`) into a single log file.

Merges several Audit log files (`$FWDIR/log/*.adtlog`) into a single log file.

### Important:

- Do not merge the *active* Security file `$FWDIR/log/fw.log` with other Security switched log files.  
Switch the active Security file `$FWDIR/log/fw.log` (with the "[fw logswitch](#)" on [page 1177](#) command) and only then merge it with other Security switched log files.
- Do not merge the *active* Audit file `$FWDIR/log/fw.adtlog` with other Audit switched log files.  
Switch the active Audit file `$FWDIR/log/fw.adtlog` (with the "[fw logswitch](#)" on [page 1177](#) command) and only then merge it with other Audit switched log files.
- This command unifies logs entries with the same Unique-ID (UID). If you rotate the current active log file before all the segments of a specific log arrive, this command merges the records with the same Unique ID from two different files, into one fully detailed record.
- If the size of the final merged log file exceeds 2GB, this command creates a list of merged files, where the size of each merged file size is not more than 2GB.  
The user receives this warning:

```
Warning: The size of the files you have chosen to merge
is greater than 2GB. The merge will produce two or more
files.
```

The names of merged files are:

- `<Name of Merged Log File>.log`
- `<Name of Merged Log File>_1.log`
- `<Name of Merged Log File>_2.log`
- ...
- `<Name of Merged Log File>_N.log`

-  **Important** - You can run this command in the Expert mode or in Gaia Clish (Gaia gClish on Scalable Platforms).

## Syntax

```
fw [-d] mergefiles {-h | -help}
```

```
fw [-d] mergefiles [-r] [-s] [-t <Time Conversion File>] <Name of
Log File 1> <Name of Log File 2> ... <Name of Log File N> <Name of
Merged Log File>
```

## Parameters

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                        | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p>                                                                                                                                                                                                                                                                                                                                                                 |
| {-h   -help}              | Shows the built-in usage.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| -r                        | Removes duplicate entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| -s                        | Sorts the merged file by the <b>Time</b> field in log records.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| -t <Time Conversion File> | <p>Specifies a full path and name of a file that instructs this command how to adjust the times during the merge. This is required if you merge log files from Log Servers configured with different time zones.<br/>The file format is:</p> <pre>&lt;IP Address of Log Server #1&gt; &lt;Signed Date Time #1 in Seconds&gt; &lt;IP Address of Log Server #2&gt; &lt;Signed Date Time #2 in Seconds&gt; ... ..</pre> <p> <b>Notes</b></p> <ul style="list-style-type: none"> <li>■ You must specify the absolute path and the file name.</li> <li>■ The name of the time conversion file cannot exceed 230 characters.</li> </ul> |

| Parameter                                                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <p><i>&lt;Name of Log File 1&gt;</i><br/> <i>... &lt;Name of Log File N&gt;</i></p> | <p>Specifies the log files to merge.</p> <p> <b>Notes:</b></p> <ul style="list-style-type: none"> <li>■ You must specify the absolute path and the name of the input log files.</li> <li>■ The name of the input log file cannot exceed 230 characters.</li> </ul>                                                                                                                                                                                                                                          |
| <p><i>&lt;Name of Merged Log File&gt;</i></p>                                       | <p>Specifies the output merged log file.</p> <p> <b>Notes:</b></p> <ul style="list-style-type: none"> <li>■ The name of the merged log file cannot exceed 230 characters.</li> <li>■ If a file with the specified name already exists, the command stops and asks you to remove the existing file, or to specify another name.</li> <li>■ The size of the merged log file cannot exceed 2 GB. In such scenario, the command creates several merged log files, each not exceeding the size limit.</li> </ul> |

### Example - Merging Security log files

```
[Expert@HostName:0]# ls -l $FWDIR/*.log
-rw-rw-r-- 1 admin root 189497 Sep  7 00:00 2019-09-07_000000.log

# fw repairlog

## Description

Check Point Security log file (\$FWDIR/log/\*.log) and Audit log files (\$FWDIR/log/\*.adtlog) are databases, with special pointer files.

If these log pointer files become corrupted (which causes the inability to read the log file), this command can rebuild them.

| Log File Type | Log File Location    | Log Pointer Files                                                            |
|---------------|----------------------|------------------------------------------------------------------------------|
| Security log  | \$FWDIR/log/*.log    | *.logptr<br>*.logaccount_ptr<br>*.loginitial_ptr<br>*.logLuuidDB             |
| Audit log     | \$FWDIR/log/*.adtlog | *.adtlogptr<br>*.adtlogaccount_ptr<br>*.adtloginitial_ptr<br>*.adtlogLuuidDB |

 **Important** - You can run this command in the Expert mode or in Gaia Clish (Gaia gClish on Scalable Platforms).

## Syntax

```
fw [-d] repairlog [-u] <Name of Log File>
```

## Parameters

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                 | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| -u                 | Specifies to rebuild the unification chains in the log file.                                                                                                                                                                                                                                                                               |
| <Name of Log File> | The name of the log file to repair.                                                                                                                                                                                                                                                                                                        |

## Example - Repairing the Audit log file

```
fw repairlog -u 2019-06-17_000000.adtlog
```

# fw sam

## Description

Manages the Suspicious Activity Monitoring (SAM) rules. You can use the SAM rules to block connections to and from IP addresses without the need to change or reinstall the Security Policy. For more information, see [sk112061](#).

You can create the Suspicious Activity Rules in two ways:

- In SmartConsole from Monitoring Results
- In CLI with the `fw sam` command

## Notes:

- See the "fw sam\_policy" and "sam\_alert" commands.
- SAM rules consume some CPU resources on Security Gateway.
  - ★ **Best Practice** - The SAM Policy rules consume some CPU resources on Security Gateway. Set an expiration for rules that gives you time to investigate, but does not affect performance. Keep only the required SAM Policy rules. If you confirm that an activity is risky, edit the Security Policy, educate users, or otherwise handle the risk.
- Logs for enforced SAM rules (configured with the `fw sam` command) are stored in the `$FWDIR/log/sam.dat` file.  
By design, the file is purged when the number of stored entries reaches 100,000.  
This data log file contains the records in one of these formats:
 

|                                                                                                             |
|-------------------------------------------------------------------------------------------------------------|
| <code>&lt;type&gt;,&lt;actions&gt;,&lt;expire&gt;,&lt;ipaddr&gt;</code>                                     |
| <code>&lt;type&gt;,&lt;actions&gt;,&lt;expire&gt;,&lt;src&gt;,&lt;dst&gt;,&lt;dport&gt;,&lt;ip_p&gt;</code> |
- SAM Requests are stored on the Security Gateway in the kernel table `sam_requests`.
- IP Addresses that are blocked by SAM rules, are stored on the Security Gateway in the kernel table `sam_blocked_ips`.

## Note - To configure SAM Server settings for a Security Gateway or Cluster:

1. Connect with SmartConsole to the applicable Security Management Server or Domain Management Server.
2. From the left navigation panel, click **Gateways & Servers**.
3. Open the Security Gateway or Cluster object.
4. From the left tree, click **Other > SAM**.
5. Configure the settings.
6. Click **OK**.
7. Install the Access Control Policy on this Security Gateway or Cluster object.

## Important:

- You can run this command in the Expert mode or in Gaia Clish (Gaia gClish on Scalable Platforms).
- In a Cluster, you must configure all the Cluster Members in the same way.
- On Scalable Platforms, you must connect to the applicable Security Group.
- VSNext mode and Traditional VSX mode do **not** support Suspicious Activity Monitoring (SAM) Rules. See [sk79700](#).

## Syntax

- To add or cancel a SAM rule according to criteria:

```
fw [-d] sam [-v] [-s <SAM Server>] [-S <SIC Name of SAM
Server>] [-f <Security Gateway>] [-t <Timeout>] [-l <Log
Type>] [-C] [-e <key=val>]+ [-r] -{n|i|I|j|J} <Criteria>
```

- To delete all SAM rules:

```
fw [-d] sam [-v] [-s <SAM Server>] [-S <SIC Name of SAM
Server>] [-f <Security Gateway>] -D
```

- To monitor all SAM rules:

```
fw [-d] sam [-v] [-s <SAM Server>] [-S <SIC Name of SAM
Server>] [-f <Security Gateway>] [-r] -M -{i|j|n|b|q} all
```

- To monitor SAM rules according to criteria:

```
fw [-d] sam [-v] [-s <SAM Server>] [-S <SIC Name of SAM
Server>] [-f <Security Gateway>] [-r] -M -{i|j|n|b|q}
<Criteria>
```

## Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d        | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| -v        | Enables verbose mode.<br>In this mode, the command writes one message to <i>stderr</i> for each Security Gateway, on which the command is enforced. These messages show whether the command was successful or not.                                                                                                                         |

| Parameter                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-s &lt;SAM Server&gt;</code>             | <p>Specifies the IP address (in the X.X.X.X format) or resolvable HostName of the Security Gateway that enforces the command.</p> <p>The default is <code>localhost</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <code>-S &lt;SIC Name of SAM Server&gt;</code> | <p>Specifies the SIC name for the SAM server to be contacted. It is expected that the SAM server has this SIC name, otherwise the connection fails.</p> <p> <b>Notes:</b></p> <ul style="list-style-type: none"> <li>■ If you do not explicitly specify the SIC name, the connection continues without the SIC names comparison.</li> <li>■ For more information about enabling the SIC, refer to the OPSEC API Specification.</li> <li>■ On VSX Gateway, run the <code>fw vsx showncs -vs &lt;VSID&gt;</code> command to show the SIC name for the applicable Virtual System.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <code>-f &lt;Security Gateway&gt;</code>       | <p>Specifies the Security Gateway, on which to enforce the action.</p> <p><code>&lt;Security Gateway&gt;</code> can be one of these:</p> <ul style="list-style-type: none"> <li>■ <b>All</b> - Default. Specifies to enforce the action on all managed Security Gateways, where SAM Server runs.<br/>You can use this syntax only on Security Management Server or Domain Management Server.</li> <li>■ <b>localhost</b> - Specifies to enforce the action on this local Check Point server (on which the <code>fw sam</code> command is executed).<br/>You can use this syntax only on Security Gateway or StandAlone.</li> <li>■ <b>Gateways</b> - Specifies to enforce the action on all objects defined as Security Gateways, on which SAM Server runs.<br/>You can use this syntax only on Security Management Server or Domain Management Server.</li> <li>■ <b>Name of Security Gateway object</b> - Specifies to enforce the action on this specific Security Gateway object.<br/>You can use this syntax only on Security Management Server or Domain Management Server.</li> <li>■ <b>Name of Group object</b> - Specifies to enforce the action on all specific Security Gateways in this Group object.</li> </ul> <p> <b>Notes:</b></p> <ul style="list-style-type: none"> <li>■ You can use this syntax only on Security Management Server or Domain Management Server.</li> <li>■ VSX Gateways and VSX Cluster Members do not support Suspicious Activity Monitoring (SAM) Rules. ### Explanation for the **<Criteria>** syntax

| Parameter                                      | Description                                                                           |
|------------------------------------------------|---------------------------------------------------------------------------------------|
| <code>src &lt;IP&gt;</code>                    | Matches the Source IP address of the connection.                                      |
| <code>dst &lt;IP&gt;</code>                    | Matches the Destination IP address of the connection.                                 |
| <code>any &lt;IP&gt;</code>                    | Matches either the Source IP address or the Destination IP address of the connection. |
| <code>subsrc &lt;IP&gt; &lt;Netmask&gt;</code> | Matches the Source IP address of the connections according to the netmask.            |
| <code>subdst &lt;IP&gt; &lt;Netmask&gt;</code> | Matches the Destination IP address of the connections according to the netmask.       |

| Parameter                                                                                                                | Description                                                                                                                                                                       |
|--------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>subany &lt;IP&gt; &lt;Netmask&gt;</code>                                                                           | Matches either the Source IP address or Destination IP address of connections according to the netmask.                                                                           |
| <code>srv &lt;Src IP&gt; &lt;Dest IP&gt;<br/>&lt;Port&gt; &lt;Protocol&gt;</code>                                        | Matches the specific Source IP address, Destination IP address, Service (port number) and Protocol.                                                                               |
| <code>subsrv &lt;Src IP&gt; &lt;Netmask&gt;<br/>&lt;Dest IP&gt; &lt;Netmask&gt; &lt;Port&gt;<br/>&lt;Protocol&gt;</code> | Matches the specific Source IP address, Destination IP address, Service (port number) and Protocol.<br>Source and Destination IP addresses are assigned according to the netmask. |
| <code>subsrvs &lt;Src IP&gt; &lt;Src<br/>Netmask&gt; &lt;Dest IP&gt; &lt;Port&gt;<br/>&lt;Protocol&gt;</code>            | Matches the specific Source IP address, source netmask, destination netmask, Service (port number) and Protocol.                                                                  |
| <code>subsrvd &lt;Src IP&gt; &lt;Dest IP&gt;<br/>&lt;Dest Netmask&gt; &lt;Port&gt;<br/>&lt;Protocol&gt;</code>           | Matches specific Source IP address, Destination IP, destination netmask, Service (port number) and Protocol.                                                                      |
| <code>dstsrv &lt;Dest IP&gt; &lt;Service&gt;<br/>&lt;Protocol&gt;</code>                                                 | Matches specific Destination IP address, Service (port number) and Protocol.                                                                                                      |
| <code>subdstsrv &lt;Dest IP&gt;<br/>&lt;Netmask&gt; &lt;Port&gt; &lt;Protocol&gt;</code>                                 | Matches specific Destination IP address, Service (port number) and Protocol.<br>Destination IP address is assigned according to the netmask.                                      |
| <code>srcpr &lt;IP&gt; &lt;Protocol&gt;</code>                                                                           | Matches the Source IP address and protocol.                                                                                                                                       |
| <code>dstpr &lt;IP&gt; &lt;Protocol&gt;</code>                                                                           | Matches the Destination IP address and protocol.                                                                                                                                  |
| <code>subsrcpr &lt;IP&gt; &lt;Netmask&gt;<br/>&lt;Protocol&gt;</code>                                                    | Matches the Source IP address and protocol of connections.<br>Source IP address is assigned according to the netmask.                                                             |
| <code>subdstpr &lt;IP&gt; &lt;Netmask&gt;<br/>&lt;Protocol&gt;</code>                                                    | Matches the Destination IP address and protocol of connections.<br>Destination IP address is assigned according to the netmask.                                                   |

# fw sam\_policy

## Description

Manages the Suspicious Activity Policy editor that works with these types of rules:

- Suspicious Activity Monitoring (SAM) rules.

See [sk112061: How to create and view Suspicious Activity Monitoring \(SAM\) Rules](#).

- Rate Limiting rules.

See [sk182350 - How to configure Rate Limiting rules for DoS Mitigation](#).

Also, see these commands:

- ["fw sam" on page 295](#)
- ["sam\\_alert" on page 404](#)

## Notes:

- These commands are interchangeable:
  - For IPv4: "fw sam\_policy" and "fw samp".
  - For IPv6: "fw6 sam\_policy" and "fw6 samp".
- You can run these commands in Gaia Clish, or Expert mode.
- Security Gateway stores the SAM Policy rules in the `$FWDIR/database/sam_policy.db` file.
- Security Gateway stores the SAM Policy management settings in the `$FWDIR/database/sam_policy.mng` file.

## Important:

- Configuration you make with these commands, survives reboot.
- You can run this command in the Expert mode or in Gaia Clish (Gaia gClish on Scalable Platforms).
- In a Cluster, you must configure all the Cluster Members in the same way.
- On Scalable Platforms, you must connect to the applicable Security Group.
- VSNext mode and Traditional VSX mode do **not** support Suspicious Activity Monitoring (SAM) Rules. See [sk79700](#).

- ★ **Best Practice** - The SAM Policy rules consume some CPU resources on Security Gateway. Set an expiration for rules that gives you time to investigate, but does not affect performance. Keep only the required SAM Policy rules. If you confirm that an activity is risky, edit the Security Policy, educate users, or otherwise handle the risk.

## Syntax for IPv4

```
fw [-d] sam_policy
    add <options>
    batch
    del <options>
    get <options>
```

```
fw [-d] samp
    add <options>
    batch
    del <options>
    get <options>
```

## Syntax for IPv6

```
fw6 [-d] sam_policy
    add <options>
    batch
    del <options>
    get <options>
```

```
fw6 [-d] samp
    add <options>
    batch
    del <options>
    get <options>
```

## Parameters

| Parameter     | Description                                                                                                                                                                                                                                                          |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d            | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> |
| add <options> | <p>Adds one Rate Limiting rule one at a time.<br/>See "<a href="#">fw sam_policy add</a>" on page 306.</p>                                                                                                                                                           |
| batch         | <p>Adds or deletes many Rate Limiting rules at a time.<br/>See "<a href="#">fw sam_policy batch</a>" on page 319.</p>                                                                                                                                                |
| del <options> | <p>Deletes one configured Rate Limiting rule one at a time.<br/>See "<a href="#">fw sam_policy del</a>" on page 321.</p>                                                                                                                                             |
| get <options> | <p>Shows all the configured Rate Limiting rules.<br/>See "<a href="#">fw sam_policy get</a>" on page 324.</p>                                                                                                                                                        |

## fw sam\_policy add

### Description

The "fw sam\_policy add" and "fw6 sam\_policy add" commands:

- Add one Suspicious Activity Monitoring (SAM) rule at a time.
- Add one Rate Limiting rule at a time.

#### Notes:

- These commands are interchangeable:
  - For IPv4: "fw sam\_policy" and "fw samp".
  - For IPv6: "fw6 sam\_policy" and "fw6 samp".
- You can run these commands in Gaia Clish, or Expert mode.
- Security Gateway stores the SAM Policy rules in the `$FWDIR/database/sam_policy.db` file.
- Security Gateway stores the SAM Policy management settings in the `$FWDIR/database/sam_policy.mng` file.

#### Important:

- Configuration you make with these commands, survives reboot.
- You can run this command in the Expert mode or in Gaia Clish (Gaia gClish on Scalable Platforms).
- In a Cluster, you must configure all the Cluster Members in the same way.
- On Scalable Platforms, you must connect to the applicable Security Group.
- VSNext mode and Traditional VSX mode do **not** support Suspicious Activity Monitoring (SAM) Rules. See [sk79700](#).

**Best Practice** - The SAM Policy rules consume some CPU resources on Security Gateway. Set an expiration for rules that gives you time to investigate, but does not affect performance. Keep only the required SAM Policy rules. If you confirm that an activity is risky, edit the Security Policy, educate users, or otherwise handle the risk.

### Syntax to configure a Suspicious Activity Monitoring (SAM) rule for IPv4

```
fw [-d] sam_policy add [-u] -a {d|n|b} [-l {r|a}] [-t <Timeout>]
[-f <Target>] [-n <"Rule Name">] [-c <"Rule Comment">] [-o <"Rule
Originator">] [-z "<Zone>"] ip <IP Filter Arguments>
```

### Syntax to configure a Suspicious Activity Monitoring (SAM) rule for IPv6

```
fw6 [-d] sam_policy add [-u] -a {d|n|b} [-l {r|a}] [-t <Timeout>]
[-f <Target>] [-n <"Rule Name">] [-c <"Rule Comment">] [-o <"Rule
Originator">] [-z "<Zone>"] ip <IP Filter Arguments>
```

## Syntax to configure a Rate Limiting rule for IPv4

```
fw [-d] sam_policy add [-u] -a {d|n|b} [-l {r|a}] [-t <Timeout>]
[-f <Target>] [-n <"Rule Name">] [-c <"Rule Comment">] [-o <"Rule
Originator">] [-z "<Zone>"] quota <Quota Filter Arguments>
```

## Syntax to configure a Rate Limiting rule for IPv6

```
fw6 [-d] sam_policy add [-u] -a {d|n|b} [-l {r|a}] [-t <Timeout>]
[-f <Target>] [-n <"Rule Name">] [-c <"Rule Comment">] [-o <"Rule
Originator">] [-z "<Zone>"] quota <Quota Filter Arguments>
```

## Parameters

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d             | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.                                                                                                                                                                                                                                                |
| -u             | Optional.<br>Specifies that the rule category is User-defined.<br>Default rule category is Auto.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| -a {d   n   b} | Mandatory.<br>Specifies the rule action if the traffic matches the rule conditions: <ul style="list-style-type: none"> <li>■ d - Drop the connection.</li> <li>■ n - Notify (generate a log) about the connection and let it through.</li> <li>■ b - Bypass the connection - let it through without checking it against the policy rules.</li> </ul> <b>Note</b> - Rules with action set to <i>Bypass</i> cannot have a log or limit specification. Bypassed packets and connections do not count towards overall number of packets and connection for limit enforcement of type ratio. |
| -l {r   a}     | Optional.<br>Specifies which type of log to generate for this rule for all traffic that matches: <ul style="list-style-type: none"> <li>■ -r - Generate a regular log</li> <li>■ -a - Generate an alert log</li> </ul>                                                                                                                                                                                                                                                                                                                                                                  |

| Parameter                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -t<br><i>&lt;Timeout&gt;</i>       | Optional.<br>Specifies the time period (in seconds), during which the rule will be enforced.<br>Default timeout is indefinite.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| -f <i>&lt;Target&gt;</i>           | Optional.<br>Specifies the target Security Gateways, on which to enforce the Rate Limiting rule.<br><i>&lt;Target&gt;</i> can be one of these: <ul style="list-style-type: none"> <li>■ <b>all</b> - This is the default option. Specifies that the rule should be enforced on all managed Security Gateways.</li> <li>■ <b>Name of the Security Gateway or Cluster object</b> - Specifies that the rule should be enforced only on this Security Gateway or Cluster object (the object name must be as defined in the SmartConsole).</li> <li>■ <b>Name of the Group object</b> - Specifies that the rule should be enforced on all Security Gateways that are members of this Group object (the object name must be as defined in the SmartConsole).</li> </ul> |
| -n " <i>&lt;Rule Name&gt;</i> "    | Optional.<br>Specifies the name (label) for this rule.<br><b>Notes:</b> <ul style="list-style-type: none"> <li>■ You must enclose this string in double quotes.</li> <li>■ The length of this string is limited to 128 characters.</li> <li>■ Before each space or a backslash character in this string, you must write a backslash (\) character. Example:               <div style="border: 1px solid black; padding: 5px; margin-top: 10px;">                 "This\ is\ a\ rule\ name\ with\ a\ backslash\ \\"               </div> </li> </ul>                                                                                                                                                                                                               |
| -c " <i>&lt;Rule Comment&gt;</i> " | Optional.<br>Specifies the comment for this rule.<br><b>Notes:</b> <ul style="list-style-type: none"> <li>■ You must enclose this string in double quotes.</li> <li>■ The length of this string is limited to 128 characters.</li> <li>■ Before each space or a backslash character in this string, you must write a backslash (\) character. Example:               <div style="border: 1px solid black; padding: 5px; margin-top: 10px;">                 "This\ is\ a\ comment\ with\ a\ backslash\ \\"               </div> </li> </ul>                                                                                                                                                                                                                       |

| Parameter                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-o "&lt;Rule Originator&gt;"</code>   | <p>Optional.<br/>Specifies the name of the originator for this rule.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>■ You must enclose this string in double quotes.</li> <li>■ The length of this string is limited to 128 characters.</li> <li>■ Before each space or a backslash character in this string, you must write a backslash (\) character. Example:</li> </ul> <pre>"Created\ by\ John\ Doe"</pre>                                           |
| <code>-z "&lt;Zone&gt;"</code>              | <p>Optional.<br/>Specifies the name of the Security Zone for this rule.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>■ You must enclose this string in double quotes.</li> <li>■ The length of this string is limited to 128 characters.</li> </ul>                                                                                                                                                                                                     |
| <code>ip &lt;IP Filter Arguments&gt;</code> | <p>Mandatory (use this <code>ip</code> parameter, or the <code>quota</code> parameter).<br/>Configures the <i>Suspicious Activity Monitoring (SAM)</i> rule.<br/>Specifies the IP Filter Arguments for the SAM rule (you must use at least one of these options):</p> <pre>[-C] [-s &lt;Source IP&gt;] [-m &lt;Source Mask&gt;] [-d &lt;Destination IP&gt;] [-M &lt;Destination Mask&gt;] [-p &lt;Port&gt;] [-r &lt;Protocol&gt;]</pre> <p>See the explanations below.</p> |

| Parameter                                                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>quota</code><br><code>&lt;Quota</code><br><code>Filter</code><br><code>Arguments&gt;</code> | <p>Mandatory (use this <code>quota</code> parameter, or the <code>ip</code> parameter).<br/> Configures the <i>Rate Limiting</i> rule.<br/> Specifies the Quota Filter Arguments for the Rate Limiting rule (see the explanations below):</p> <ul style="list-style-type: none"> <li>■ <code>[flush true]</code></li> <li>■ <code>[source-negated {true   false}] source &lt;Source&gt;</code></li> <li>■ <code>[destination-negated {true   false}] destination &lt;Destination&gt;</code></li> <li>■ <code>[service-negated {true   false}] service &lt;Protocol and Port numbers&gt;</code></li> <li>■ <code>[&lt;Limit1 Name&gt; &lt;Limit1 Value&gt;] [&lt;Limit2 Name&gt; &lt;Limit2 Value&gt;] ... [&lt;LimitN Name&gt; &lt;LimitN Value&gt;]</code></li> <li>■ <code>[track &lt;Track&gt;]</code></li> </ul> <p> <b>Important:</b></p> <ul style="list-style-type: none"> <li>■ The Quota rules are not applied immediately to the Security Gateway. They are only registered in the Suspicious Activity Monitoring (SAM) policy database. To apply all the rules from the SAM policy database immediately, add "flush true" in the <code>fw sam_policy add</code> command syntax.</li> <li>■ Explanation:<br/> For new connections rate (and for any rate limiting in general), when a rule's limit is violated, the Security Gateway also drops all packets that match the rule.<br/> The Security Gateway computes new connection rates on a per-second basis.<br/> At the start of the 1-second timer, the Security Gateway allows all packets, including packets for existing connections.<br/> If, at some point, during that 1 second period, there are too many new connections, then the Security Gateway blocks all remaining packets for the remainder of that 1-second interval.<br/> At the start of the next 1-second interval, the counters are reset, and the process starts over - the Security Gateway allows packets to pass again up to the point, where the rule's limit is violated.</li> </ul> |

## Explanation for the *IP Filter Arguments* syntax for Suspicious Activity Monitoring (SAM) rules

| Argument              | Description                                                                                  |
|-----------------------|----------------------------------------------------------------------------------------------|
| -C                    | Specifies that open connections should be closed.                                            |
| -s <Source IP>        | Specifies the Source IP address.                                                             |
| -m <Source Mask>      | Specifies the Source subnet mask (in dotted decimal format - x.y.z.w).                       |
| -d <Destination IP>   | Specifies the Destination IP address.                                                        |
| -M <Destination Mask> | Specifies the Destination subnet mask (in dotted decimal format - x.y.z.w).                  |
| -p <Port>             | Specifies the port number (see <a href="#">IANA Service Name and Port Number Registry</a> ). |
| -r <Protocol>         | Specifies the protocol number (see <a href="#">IANA Protocol Numbers</a> ).                  |

Explanation for the *Quota Filter Arguments* syntax for Rate Limiting rules

| Argument                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Examples

### Example 1 - Rate Limiting rule with a range

```
fw sam_policy add -a d -l r -t 3600 quota service any source range:172.16.7.11-172.16.7.13 new-conn-rate 5 flush true
```

#### Explanations:

- This rule drops packets for all connections (`-a d`) that exceed the quota set by this rule, including packets for existing connections.
- This rule logs packets (`-l r`) that exceed the quota set by this rule.
- This rule will expire in 3600 seconds (`-t 3600`).
- This rule limits the rate of creation of new connections to 5 connections per second (`new-conn-rate 5`) for any traffic (`service any`) from the source IP addresses in the range 172.16.7.11 - 172.16.7.13 (`source range:172.16.7.11-172.16.7.13`).

**Note** - The limit of the total number of log entries per second is configured with the *fwaccel dos config set -n <rate>* command.

- This rule will be compiled and loaded on the SecureXL, together with other rules in the Suspicious Activity Monitoring (SAM) policy database immediately, because this rule includes the "flush true" parameter.

## Example 2 - Rate Limiting rule with a service specification

```
fw sam_policy add -a n -l r quota service 1,50-51,6/443,17/53 service-negated true source cc:QQ byte-rate 0
```

### Explanations:

- This rule logs and lets through all packets (`-a n`) that exceed the quota set by this rule.
- This rule does not expire (the `timeout` parameter is not specified). To cancel it, you must delete it explicitly.
- This rule applies to all packets except (`service-negated true`) the packets with IP protocol number 1, 50-51, 6 port 443 and 17 port 53 (`service 1,50-51,6/443,17/53`).
- This rule applies to all packets from source IP addresses that are assigned to the country with specified country code (`cc:QQ`).
- This rule does not let any traffic through (`byte-rate 0`) except the packets with IP protocol number 1, 50-51, 6 port 443 and 17 port 53.
- This rule will not be compiled and installed on the SecureXL immediately, because it does not include the "`flush true`" parameter.

## Example 3 - Rate Limiting rule with ASN

```
fw sam_policy -a d quota source asn:AS64500,cidr:[::FFFF:C0A8:1100]/120 service any pkt-rate 0
```

### Explanations:

- This rule drops (`-a d`) all packets that match this rule.
- This rule does not expire (the `timeout` parameter is not specified). To cancel it, you must delete it explicitly.
- This rule applies to packets from the Autonomous System number 64500 (`asn:AS64500`).
- This rule applies to packets from source IPv6 addresses FFFF:C0A8:1100/120 (`cidr:[::FFFF:C0A8:1100]/120`).
- This rule applies to all traffic (`service any`).
- This rule does not let any traffic through (`pkt-rate 0`).
- This rule will not be compiled and installed on the SecureXL immediately, because it does not include the "`flush true`" parameter.

## Example 4 - Rate Limiting rule with an Allow List

```
fw sam_policy add -a b quota source range:172.16.8.17-172.16.9.121 service 6/80
```

### Explanations:

- This rule bypasses (`-a b`) all packets that match this rule.

**Note** - The Access Control Policy and other types of security policy rules still apply.

- This rule does not expire (the `timeout` parameter is not specified). To cancel it, you must delete it explicitly.
- This rule applies to packets from the source IP addresses in the range 172.16.8.17 - 172.16.9.121 (`range:172.16.8.17-172.16.9.121`).
- This rule applies to packets sent to TCP port 80 (`service 6/80`).
- This rule will not be compiled and installed on the SecureXL immediately, because it does not include the "`flush true`" parameter.

### Example 5 - Rate Limiting rule with tracking

```
fw sam_policy add -a d quota service any source-negated true source cc:QQ concurrent-conns-ratio 655 track source
```

#### Explanations:

- This rule drops (`-a d`) all packets that match this rule.
- This rule does not log any packets (the `-l r` parameter is not specified).
- This rule does not expire (the `timeout` parameter is not specified). To cancel it, you must delete it explicitly.
- This rule applies to all traffic (`service any`).
- This rule applies to all sources except (`source-negated true`) the source IP addresses that are assigned to the country with specified country code (`cc:QQ`).
- This rule limits the maximum number of concurrent active connections to  $655/65536 \approx 1\%$  (`concurrent-conns-ratio 655`) for any traffic (`service any`) except (`source-negated true`) the connections from the source IP addresses that are assigned to the country with specified country code (`cc:QQ`).
- This rule counts connections, packets, and bytes for traffic only from sources that match this rule, and not cumulatively for this rule.
- This rule will not be compiled and installed on the SecureXL immediately, because it does not include the "`flush true`" parameter.

## fw sam\_policy batch

### Description

The "fw sam\_policy batch" and "fw6 sam\_policy batch" commands:

- Add and delete many Suspicious Activity Monitoring (SAM) rules at a time.
- Add and delete many Rate Limiting rules at a time.

#### Notes:

- These commands are interchangeable:
  - For IPv4: "fw sam\_policy" and "fw samp".
  - For IPv6: "fw6 sam\_policy" and "fw6 samp".
- You can run these commands in Gaia Clish, or Expert mode.
- Security Gateway stores the SAM Policy rules in the `$FWDIR/database/sam_policy.db` file.
- Security Gateway stores the SAM Policy management settings in the `$FWDIR/database/sam_policy.mng` file.

#### Important:

- Configuration you make with these commands, survives reboot.
- You can run this command in the Expert mode or in Gaia Clish (Gaia gClish on Scalable Platforms).
- In a Cluster, you must configure all the Cluster Members in the same way.
- On Scalable Platforms, you must connect to the applicable Security Group.
- VSNext mode and Traditional VSX mode do **not** support Suspicious Activity Monitoring (SAM) Rules. See [sk79700](#).

**Best Practice** - The SAM Policy rules consume some CPU resources on Security Gateway. Set an expiration for rules that gives you time to investigate, but does not affect performance. Keep only the required SAM Policy rules. If you confirm that an activity is risky, edit the Security Policy, educate users, or otherwise handle the risk.

### Procedure

#### 1. Start the batch mode

- For IPv4, run:

```
fw sam_policy batch << EOF
```

- For IPv6, run:

```
fw6 sam_policy batch << EOF
```

## 2. Enter the applicable commands

- Enter one "add" or "del" command on each line, on as many lines as necessary.

Start each line with only "add" or "del" parameter (not with "fw samp").

- Use the same set of parameters and values as described in these commands:
  - fw sam\_policy add
  - fw sam\_policy del
- Terminate each line with a Return (ASCII 10 - Line Feed) character (press Enter).

## 3. End the batch mode

Type EOF and press Enter.

### Example of a Rate Limiting rule for IPv4

```
[Expert@HostName]# fw samp batch <<EOF
add -a d -l r -t 3600 -c "Limit\ conn\ rate\ to\ 5\ conn/sec from\ these\ sources" quota service
any source range:172.16.7.13-172.16.7.13 new-conn-rate 5

del <501f6ef0,00000000,cb38a8c0,0a0afffe>

add -a b quota source range:172.16.8.17-172.16.9.121 service 6/80

EOF
[Expert@HostName]#
```

## fw sam\_policy del

### Description

The "fw sam\_policy del" and "fw6 sam\_policy del" commands:

- Delete one configured Suspicious Activity Monitoring (SAM) rule at a time.
- Delete one configured Rate Limiting rule at a time.

#### Notes:

- These commands are interchangeable:
  - For IPv4: "fw sam\_policy" and "fw samp".
  - For IPv6: "fw6 sam\_policy" and "fw6 samp".
- You can run these commands in Gaia Clish, or Expert mode.
- Security Gateway stores the SAM Policy rules in the `$FWDIR/database/sam_policy.db` file.
- Security Gateway stores the SAM Policy management settings in the `$FWDIR/database/sam_policy.mng` file.

#### Important:

- Configuration you make with these commands, survives reboot.
- You can run this command in the Expert mode or in Gaia Clish (Gaia gClish on Scalable Platforms).
- In a Cluster, you must configure all the Cluster Members in the same way.
- On Scalable Platforms, you must connect to the applicable Security Group.
- VSNext mode and Traditional VSX mode do **not** support Suspicious Activity Monitoring (SAM) Rules. See [sk79700](#).

**Best Practice** - The SAM Policy rules consume some CPU resources on Security Gateway. Set an expiration for rules that gives you time to investigate, but does not affect performance. Keep only the required SAM Policy rules. If you confirm that an activity is risky, edit the Security Policy, educate users, or otherwise handle the risk.

### Syntax for IPv4

```
fw [-d] sam_policy del '<Rule UID>'
```

### Syntax for IPv6

```
fw6 [-d] sam_policy del '<Rule UID>'
```

## Parameters

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                         |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d           | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.            |
| '<Rule UID>' | Specifies the UID of the rule you wish to delete.<br> <b>Important:</b> <ul style="list-style-type: none"> <li>■ The quote marks and angle brackets ('&lt;...&gt;') are mandatory.</li> <li>■ To see the Rule UID, run the "fw sam_policy get" command.</li> </ul> |

## Procedure

### 1. List all the existing rules in the Suspicious Activity Monitoring policy database

List all the existing rules in the Suspicious Activity Monitoring policy database.

- For IPv4, run:

```
fw sam_policy get
```

- For IPv6, run:

```
fw6 sam_policy get
```

The rules show in this format:

```
operation=add uid=<Value1,Value2,Value3,Value4> target=...
timeout=... action=... log= ... name= ... comment=...
originator= ... src_ip_addr=... req_tpe=...
```

Example for IPv4:

```
operation=add uid=<5ac3965f,00000000,3403a8c0,0000264a>
target=all timeout=300 action=notify log=log name=Test\ Rule
comment=Notify\ about\ traffic\ from\ 1.1.1.1
originator=John\ Doe src_ip_addr=1.1.1.1 req_tpe=ip
```

## 2. Delete a rule from the list by its UID

- For IPv4, run:

```
fw [-d] sam_policy del '<Rule UID>'
```

- For IPv6, run:

```
fw6 [-d] sam_policy del '<Rule UID>'
```

Example for IPv4:

```
fw samp del '<5ac3965f,00000000,3403a8c0,0000264a>'
```

## 3. Add the flush-only rule

- For IPv4, run:

```
fw samp add -t 2 quota flush true
```

- For IPv6, run:

```
fw6 samp add -t 2 quota flush true
```

Explanation:

The "fw samp del" and "fw6 samp del" commands only remove a rule from the persistent database. The Security Gateway continues to enforce the deleted rule until the next time you compiled and load a policy. To force the rule deletion immediately, you must enter a flush-only rule right after the "fw samp del" and "fw6 samp del" command. This flush-only rule immediately deletes the rule you specified in the previous step, and times out in 2 seconds.

- ★ **Best Practice** - Specify a short timeout period for the flush-only rules. This prevents accumulation of rules that are obsolete in the database.

## fw sam\_policy get

### Description

The "fw sam\_policy get" and "fw6 sam\_policy get" commands:

- Show all the configured Suspicious Activity Monitoring (SAM) rules.
- Show all the configured Rate Limiting rules.

#### Notes:

- These commands are interchangeable:
  - For IPv4: "fw sam\_policy" and "fw samp".
  - For IPv6: "fw6 sam\_policy" and "fw6 samp".
- You can run these commands in Gaia Clish, or Expert mode.
- Security Gateway stores the SAM Policy rules in the `$FWDIR/database/sam_policy.db` file.
- Security Gateway stores the SAM Policy management settings in the `$FWDIR/database/sam_policy.mng` file.

#### Important:

- Configuration you make with these commands, survives reboot.
- You can run this command in the Expert mode or in Gaia Clish (Gaia gClish on Scalable Platforms).
- In a Cluster, you must configure all the Cluster Members in the same way.
- On Scalable Platforms, you must connect to the applicable Security Group.
- VSNext mode and Traditional VSX mode do **not** support Suspicious Activity Monitoring (SAM) Rules. See [sk79700](#).

**Best Practice** - The SAM Policy rules consume some CPU resources on Security Gateway. Set an expiration for rules that gives you time to investigate, but does not affect performance. Keep only the required SAM Policy rules. If you confirm that an activity is risky, edit the Security Policy, educate users, or otherwise handle the risk.

### Syntax for IPv4

```
fw [-d] sam_policy get [-l] [-u '<Rule UID>'] [-k '<Key>' -t
<Type> [{-v '<Value>'}] [-n]]
```

### Syntax for IPv6

```
fw6 [-d] sam_policy get [-l] [-u '<Rule UID>'] [-k '<Key>' -t
<Type> [{-v '<Value>'}] [-n]]
```

## Parameters

**Note** - All these parameters are optional.

| Parameter       | Description                                                                                                                                                                                                                                                                                                                              |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d              | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| -l              | Controls how to print the rules: <ul style="list-style-type: none"> <li>■ In the default format (without "-l"), the output shows each rule on a separate line.</li> <li>■ In the list format (with "-l"), the output shows each parameter of a rule on a separate line.</li> <li>■ See the "fw sam_policy add" command.</li> </ul>       |
| -u '<Rule UID>' | Prints the rule specified by its Rule UID or its zero-based rule index.<br>The quote marks and angle brackets ('<...>') are mandatory.                                                                                                                                                                                                   |
| -k '<Key>'      | Prints the rules with the specified predicate key.<br>The quote marks are mandatory.                                                                                                                                                                                                                                                     |
| -t <Type>       | Prints the rules with the specified predicate type.<br>For Rate Limiting rules, you must always use "-t in".                                                                                                                                                                                                                             |
| +{-v '<Value>'} | Prints the rules with the specified predicate values.<br>The quote marks are mandatory.                                                                                                                                                                                                                                                  |
| -n              | Negates the condition specified by these predicate parameters: <ul style="list-style-type: none"> <li>■ -k</li> <li>■ -t</li> <li>■ +-v</li> </ul>                                                                                                                                                                                       |

## Examples

### Example 1 - Output in the default format

```
[Expert@HostName:0]# fw samp get

operation=add uid=<5ac3965f,00000000,3403a8c0,0000264a> target=all timeout=300 action=notify
log=log name=Test\ Rule comment=Notify\ about\ traffic\ from\ 1.1.1.1 originator=John\ Doe
src_ip_addr=1.1.1.1 req_tpe=ip
```

**Example 2 - Output in the list format**

```
[Expert@HostName:0]# fw samp get -l
uid
<5ac3965f,00000000,3403a8c0,0000264a>
target
all
timeout
2147483647
action
notify
log
log
name
Test\ Rule
comment
Notify\ about\ traffic\ from\ 1.1.1.1
originator
John\ Doe
src_ip_addr
1.1.1.1
req_type
ip
```

**Example 3 - Printing a rule by its Rule UID**

```
[Expert@HostName:0]# fw samp get -u '<5ac3965f,00000000,3403a8c0,0000264a>'
0
operation=add uid=<5ac3965f,00000000,3403a8c0,0000264a> target=all timeout=300 action=notify
log=log name=Test\ Rule comment=Notify\ about\ traffic\ from\ 1.1.1.1 originator=John\ Doe
src_ip_addr=1.1.1.1 req_tpe=ip
```

#### Example 4 - Printing rules that match the specified filters

```

[Expert@HostName:0]# fw samp get
no corresponding SAM policy requests
[Expert@HostName:0]#
[Expert@HostName:0]# fw samp add -a d -l r -t 3600 quota service any source
range:172.16.7.11-172.16.7.13 new-conn-rate 5 flush true

# fwm

## Description

Performs various management operations and shows various management information.

### Notes:

- For debug instructions, see the description of the `fwm` process in [sk97638](#).
- On a Multi-Domain Server, you must run these commands in the context of the applicable Domain Management Server.

## Syntax

```
fwm [-d]
    dbload <options>
    exportcert <options>
    fetchfile <options>
    fingerprint <options>
    getpcap <options>
    ikecrypt <options>
    load [<options>]
    logexport <options>
    mds <options>
    printcert <options>
    sic_reset
    snmp_trap <options>
    unload [<options>]
    ver [<options>]
    verify <options>
```

## Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                               |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d        | <p>Runs the command in debug mode.</p> <p>Use only if you troubleshoot the command itself.</p> <p> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> |

| Parameter                                                | Description                                                                                                                                                                                            |
|----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>dbload</code><br><code>&lt;options&gt;</code>      | Downloads the user database and network objects information to the specified targets<br>See <a href="#">"fwm dbload" on page 333</a> .                                                                 |
| <code>exportcert</code><br><code>&lt;options&gt;</code>  | Export a SIC certificate of the specified object to file.<br>See <a href="#">"fwm exportcert" on page 334</a> .                                                                                        |
| <code>fetchfile</code><br><code>&lt;options&gt;</code>   | Fetches a specified OPSEC configuration file from the specified source server.<br>See <a href="#">"fwm fetchfile" on page 335</a> .                                                                    |
| <code>fingerprint</code><br><code>&lt;options&gt;</code> | Shows the Check Point fingerprint.<br>See <a href="#">"fwm fingerprint" on page 337</a> .                                                                                                              |
| <code>getpcap</code><br><code>&lt;options&gt;</code>     | Fetches the IPS packet capture data from the specified Security Gateway.<br>See <a href="#">"fwm getpcap" on page 339</a> .                                                                            |
| <code>ikecrypt</code><br><code>&lt;options&gt;</code>    | Encrypts a secret with a key.<br>See <a href="#">"fwm ikecrypt" on page 341</a> .                                                                                                                      |
| <code>load</code><br><code>&lt;options&gt;</code>        | This command is obsolete for R80 and higher.<br>Use the <a href="#">"mgmt_cli" on page 386</a> command to load a policy to a managed Security Gateway.<br>See <a href="#">"fwm load" on page 342</a> . |
| <code>logexport</code><br><code>&lt;options&gt;</code>   | Exports a Security log file ( <code>\$FWDIR/log/*.log</code> ) or Audit log file ( <code>\$FWDIR/log/*.adtlog</code> ) to an ASCII file.<br>See <a href="#">"fwm logexport" on page 343</a> .          |
| <code>mds &lt;options&gt;</code>                         | Shows information and performs various operations on Multi-Domain Server.<br>See <a href="#">"fwm mds" on page 348</a> .                                                                               |
| <code>printcert</code><br><code>&lt;options&gt;</code>   | Shows a SIC certificate's details.<br>See <a href="#">"fwm printcert" on page 350</a> .                                                                                                                |
| <code>sic_reset</code>                                   | Resets SIC on the Management Server.<br>See <a href="#">"fwm sic_reset" on page 356</a> .                                                                                                              |
| <code>snmp_trap</code><br><code>&lt;options&gt;</code>   | Sends an SNMP Trap to the specified host.<br>See <a href="#">"fwm snmp_trap" on page 357</a> .                                                                                                         |
| <code>unload</code><br><code>&lt;options&gt;</code>      | Unloads the policy from the specified managed Security Gateways.<br>See <a href="#">"fwm unload" on page 360</a> .                                                                                     |

| Parameter                               | Description                                                                                                                                                                  |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ver &lt;options&gt;</code>        | Shows the Check Point version of the Management Server.<br>See <a href="#">"fwm ver" on page 364</a> .                                                                       |
| <code>verify<br/>&lt;options&gt;</code> | This command is obsolete for R80 and higher.<br>Use the <a href="#">"mgmt_cli" on page 386</a> command to verify a policy.<br>See <a href="#">"fwm verify" on page 365</a> . |

# fwm dbload

## Description

Copies the user database and network objects information to specified managed servers with one or more **Management** Software Blades enabled.

**Important** - This command is obsolete for R80 and higher.

Use the API command `"install-database"` to install the database on the applicable servers.

See the [Check Point Management API Reference](#) (at the top, select the correct version) .

# fwm exportcert

## Description

Export a SIC certificate of the specified managed object to a file.

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
fwm [-d] exportcert -obj <Name of Object> -cert <Name of CA> -file  
<Output File> [-withroot] [-pem]
```

## Parameters

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d               | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.<br>For complete debug instructions, see the description of the <code>fwm</code> process in <a href="#">sk97638</a> . |
| <Name of Object> | Specifies the name of the managed object, whose certificate you wish to export.                                                                                                                                                                                                                                                                                                                                                                                 |
| <Name of CA>     | Specifies the name of Certificate Authority, whose certificate you wish to export.                                                                                                                                                                                                                                                                                                                                                                              |
| <Output File>    | Specifies the name of the output file.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| -withroot        | Exports the certificate's root in addition to the certificate's content.                                                                                                                                                                                                                                                                                                                                                                                        |
| -pem             | Save the exported information in a text file.<br>Default is to save in a binary file.                                                                                                                                                                                                                                                                                                                                                                           |

# fwm fetchfile

## Description

Fetches a specified OPSEC configuration file from the specified source server.

This command supports only the `fwopsec.conf` or `fwopsec.v4x` files.

 **Note:**  
On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

`mdsenv <IP Address or Name of Domain Management Server>`

## Syntax

```
fwm [-d] fetchfile -r <File> [-d <Local Path>] <Source>
```

## Parameters

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d              | <p>Runs the command in debug mode.</p> <p>Use only if you troubleshoot the command itself.</p> <p> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> |
| -r <File>       | <p>Specifies the relative <code>fw1</code> directory.</p> <p>This command supports only these files:</p> <ul style="list-style-type: none"><li>■ <code>conf/fwopsec.conf</code></li><li>■ <code>conf/fwopsec.v4x</code></li></ul>                                                                                                                         |
| -d <Local Path> | <p>Specifies the local directory to save the fetched file.</p>                                                                                                                                                                                                                                                                                            |
| <Source>        | <p>Specifies the managed remote source server, from which to fetch the file.</p> <p> <b>Note</b> - The local and the remote source servers must have established SIC trust.</p>                                                                                        |

## Example

```
[Expert@MGMT:0]# fwm fetchfile -r "conf/fwopsec.conf" -d /tmp 192.168.3.52
Fetching conf/fwopsec.conf from 192.168.3.52...
Done
[Expert@MGMT:0]#
```

# fwm fingerprint

## Description

Shows the Check Point fingerprint.

 **Note:**  
On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

mdsensv <IP Address or Name of Domain Management Server>

## Syntax

```
fwm [-d] fingerprint [-d]
    <IP address of Target> <SSL Port>
    localhost <SSL Port>
```

## Parameters

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                     | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> <p>The debug options are:</p> <ul style="list-style-type: none"><li>■ <code>fwm -d</code><br/>Runs the complete debug of all <code>fwm</code> actions.<br/>For complete debug instructions, see the description of the <code>fwm process</code> in <a href="#">sk97638</a>.</li><li>■ <code>fingerprint -d</code><br/>Runs the debug only for the fingerprint actions.</li></ul> |
| <IP address of Target> | Specifies the IP address of a remote managed server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <SSL Port>             | Specifies the SSL port number.<br>The default is 443.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Example 1 - Showing the fingerprint on the local Management Server

```
[Expert@MGMT:0]# fwm fingerprint localhost 443
#DN OID.1.2.840.113549.1.9.2=An optional company name,Email=Email
Address,CN=192.168.3.51,L=Locality Name (eg\, city)
#FINGER 11:A6:F7:1F:B9:F5:15:BC:F9:7B:5F:DC:28:FC:33:C5
##
[Expert@MGMT:0]#
```

## Example 2 - Showing the fingerprint from a managed Security Gateway

```
[Expert@MGMT:0]# fwm fingerprint 192.168.3.52 443
#DN OID.1.2.840.113549.1.9.2=An optional company name,Email=Email
Address,CN=192.168.3.52,L=Locality Name (eg\, city)
#FINGER 5C:8E:4D:B9:B4:3A:58:F3:79:18:F1:70:99:8B:5F:2B
##
[Expert@MGMT:0]#
```

# fwm getpcap

## Description

Fetches the IPS packet capture data from the specified Security Gateway.

This command only works with IPS packet captures stored on the Security Gateway in the `$FWDIR/log/captures_repository/` directory.

This command does not work with other Software Blades, such as Anti-Bot and Anti-Virus that store packet captures in the `$FWDIR/log/blob/` directory on the Security Gateway.

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsend <IP Address or Name of Domain Management Server>
```

## Syntax

```
fwm [-d] getpcap -g <Security Gateway> -u '{<Capture UID>}' -p <Local Path>
```

## Parameters

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                       | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br><b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.<br>For complete debug instructions, see the description of the <code>fwm</code> process in <a href="#">sk97638</a> . |
| -g<br><Security Gateway> | Specifies the main IP address or Name of Security Gateway object as configured in SmartConsole.                                                                                                                                                                                                                                                                             |
| -u '<br>{<Capture UID>}' | Specifies the Unique ID of the packet capture file.<br>To see the Unique ID of the packet capture file, open the applicable log file in <b>SmartConsole &gt; Logs &amp; Events &gt; Logs</b> .                                                                                                                                                                              |
| -p <Local Path>          | Specifies the local path to save the specified packet capture file.<br>If you do not specify the local directory explicitly, the command saves the packet capture file in the current working directory.                                                                                                                                                                    |

## Example

```
[Expert@MGMT:0]# fwm getpcap -g 192.168.162.1 -u '{0x4d79dc02,0x10000,0x220da8c0,0xffffffff}'  
/var/log/  
[Expert@MGMT:0]#
```

# fwm ikecrypt

## Description

Encrypts the password of an Endpoint VPN Client user using IKE. The resulting string must then be stored in the LDAP database.

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
fwm [-d] ikecrypt <Key> <Password>
```

## Parameters

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d         | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.<br>For complete debug instructions, see the description of the <code>fwm</code> process in <a href="#">sk97638</a> . |
| <Key>      | Specifies the IKE Key as defined in the <b>LDAP Account Unit</b> properties window on the <b>Encryption</b> tab.                                                                                                                                                                                                                                                                                                                                                |
| <Password> | Specifies the password for the Endpoint VPN Client user.                                                                                                                                                                                                                                                                                                                                                                                                        |

## Example

```
[Expert@MGMT:0]# fwm ikecrypt MySecretKey MyPassword
OUQJHiNHCj6HJGH8ntnKQ7tg
[Expert@MGMT:0]#
```

# fwm load

## Description

Loads a policy on a managed Security Gateway.

**Important** - This command is obsolete for R80 and higher.

Use the API command "install-policy" to load a policy on a managed Security Gateway.

See the [Check Point Management API Reference](#) (at the top, select the correct version) .

# fwm logexport

## Description

Exports a Security log file (\$FWDIR/log/\*.log) or Audit log file (\$FWDIR/log/\*.adtlog) to an ASCII file.

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
fwm logexport -h
```

```
fwm [-d] logexport [{-d <Delimiter> | -s}] [-t <Table Delimiter>]
[-i <Input File>] [-o <Output File>] [{-f | -e}] [-x <Start Entry
Number>] [-y <End Entry Number>] [-z] [-n] [-p] [-a] [-u
<Unification Scheme File>] [-m {initial | semi | raw}]
```

## Parameters

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -h                        | Shows the built-in usage.                                                                                                                                                                                                                                                                                                                                                                   |
| -d                        | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> <p>For complete debug instructions, see the description of the <code>fwm</code> process in <a href="#">sk97638</a>.</p> |
| -d<br><Delimiter><br>  -s | <p>Specifies the output delimiter between fields of log entries:</p> <ul style="list-style-type: none"> <li>▪ -d &lt;Delimiter&gt; - Uses the specified delimiter.</li> <li>▪ -s - Uses the ASCII character #255 (non-breaking space) as the delimiter.</li> </ul> <p><b>Note</b> - If you do not specify the delimiter explicitly, the default is a semicolon (;).</p>                     |

| Parameter                                  | Description                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-t &lt;Table Delimiter&gt;</code>    | <p>Specifies the output delimiter inside table field.<br/>Table field would look like:<br/><i>ROWx:COL0,ROWx:COL1,ROWx:COL2</i>, and so on</p> <p><b>Note</b> - If you do not specify the table delimiter explicitly, the default is a comma (,).</p>                                                                                                                      |
| <code>-i &lt;Input File&gt;</code>         | <p>Specifies the name of the input log file.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>■ This command supports only Security log file (\$FWDIR/log/*.log) and Audit log file (\$FWDIR/log/*.adtlog)</li> <li>■ If you do not specify the input log file explicitly, the command processes the active Security log file \$FWDIR/log/fw.log</li> </ul> |
| <code>-o &lt;Output File&gt;</code>        | <p>Specifies the name of the output file.</p> <p><b>Note</b> - If you do not specify the output log file explicitly, the command prints its output on the screen.</p>                                                                                                                                                                                                      |
| <code>-f</code>                            | <p>After reaching the end of the currently opened log file, specifies to continue to monitor the log file indefinitely and export the new entries as well.</p> <p><b>Note</b> - Applies only to the <i>active</i> log file: \$FWDIR/log/fw.log or \$FWDIR/log/fw.adtlog</p>                                                                                                |

| -p                                 | Specifies to not to perform resolution of the port numbers in the log file (this is the default behavior).<br>This significantly speeds up the log processing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| -a                                 | Exports only Account log entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| -u<br><Unification<br>Scheme File> | Specifies the path and name of the log unification scheme file.<br>The default log unification scheme file is:<br>\$FWDIR/conf/log_unification_scheme.C                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| -m {initial<br>  semi  <br>raw}    | Specifies the log unification mode: <ul style="list-style-type: none"> <li>■ <b>initial</b> - Complete unification of log entries. The command exports one unified log entry for each ID. This is the default. If you also specify the "-f" parameter, then the output does not export any updates, but exports only entries that relate to the start of new connections. To export updates as well, use the "semi" parameter.</li> <li>■ <b>semi</b> - Step-by-step unification of log entries. For each log entry, exports entry that unifies this entry with all previously encountered entries with the same ID.</li> <li>■ <b>raw</b> - No log unification. Exports all log entries.</li> </ul> |

The output of the `fwm logexport` command appears in tabular format.

The first row lists the names of all log fields included in the log entries.

Each of the next rows consists of a single log entry, whose fields are sorted in the same order as the first row.

If a log entry has no information in a specific field, this field remains empty (as indicated by two successive semi-colons "; ;").

You can control which log fields appear in the output of the command output:

| Step | Instructions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

[Expert@MGMT:0]#
```

# fwm mds

## Description

- Shows the Check Point version of the Multi-Domain Server.
- Rebuilds status tree for Global VPN Communities.

 **Note** - On a Multi-Domain Server, you can run this command:

- In the context of the MDS:

```
mdsenv
```

- In the context of a Domain Management Server:

```
mdsenv <IP Address or Name of Domain  
Management Server>
```

## Syntax

```
fwm [-d] mds  
    ver  
    rebuild_global_communities_status {all | missing}
```

## Parameters

| Parameter                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                                | <p>Runs the command in debug mode.</p> <p>Use only if you troubleshoot the command itself.</p> <p> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> <p>For complete debug instructions, see the description of the <code>fwm</code> process in <a href="#">sk97638</a>.</p> |
| ver                               | <p>Shows the Check Point version of the Multi-Domain Server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                  |
| rebuild_global_communities_status | <p>Rebuilds status tree for Global VPN Communities:</p> <ul style="list-style-type: none"><li>▪ <code>all</code> - Rebuilds status tree for all Global VPN Communities.</li><li>▪ <code>missing</code> - Rebuild status tree only for Global VPN Communities that do not have status trees.</li></ul>                                                                                                                                                                             |

## Example

```
[Expert@MDS:0]# fwm mds ver  
This is Check Point Multi-Domain Security Management R82.10 -  
Build 11  
[Expert@MDS:0]#
```

# fwm printcert

## Description

Shows a SIC certificate's details.

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
fwm [-d] printcert
      -obj <Name of Object> [-cert <Certificate Nick Name>] [-
verbose]
      -ca <CA Name> [-x509 <Name of File> [-p]] [-verbose]
      -f <Name of Binary Certificate File> [-verbose]
```

## Parameters

| Item                                 | Description                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                                   | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> <p>For complete debug instructions, see the description of the <code>fwm</code> process in <a href="#">sk97638</a>.</p> |
| -obj <Name of Object>                | Specifies the name of the managed object, for which to show the SIC certificate information.                                                                                                                                                                                                                                                                                                 |
| -cert <Certificate Nick Name>        | Specifies the certificate nick name.                                                                                                                                                                                                                                                                                                                                                         |
| -ca <CA Name>                        | <p>Specifies the name of the Certificate Authority.</p> <p><b>Note</b> - Check Point CA Name is <code>internal_ca</code>.</p>                                                                                                                                                                                                                                                                |
| -x509 <Name of File>                 | Specifies the name of the X.509 file.                                                                                                                                                                                                                                                                                                                                                        |
| -p                                   | Specifies to show the SIC certificate as a text file.                                                                                                                                                                                                                                                                                                                                        |
| -f <Name of Binary Certificate File> | Specifies the binary SIC certificate file to show.                                                                                                                                                                                                                                                                                                                                           |
| -verbose                             | Shows the information in verbose mode.                                                                                                                                                                                                                                                                                                                                                       |

## Examples

### Example 1 - Showing the SIC certificate of a Management Server

```
[Expert@MGMT:0]# fwm printcert -ca internal_ca
Subject: O=MGMT.checkpoint.com.s6t98x
Issuer: O=MGMT.checkpoint.com.s6t98x
Not Valid Before: Sun Apr 8 13:41:00 2018 Local Time
Not Valid After: Fri Jan 1 05:14:07 2038 Local Time
Serial No.: 1
Public Key: RSA (2048 bits)
Signature: RSA with SHA256
Key Usage:
    digitalSignature
    keyCertSign
    cRLSign
Basic Constraint:
    is CA
MD5 Fingerprint:
    7B:F9:7B:4C:BD:40:B9:1C:AB:2C:AE:CF:66:2E:E7:06
SHA-1 Fingerprints:

# fwm sic\_reset

## Description

Resets SIC on the Management Server.

For detailed procedure, see [sk65764: How to reset SIC](#).

 **Warning:**

- Before you run this command, take a Gaia Snapshot and a full backup of the Management Server.  
This command resets SIC between the Management Server and all its managed objects.
- This operation breaks trust in all Internal CA certificates and SIC trust across the managed environment.  
Therefore, we do not recommend it at all, except for real disaster recovery.

 **Note**

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

`mdsend <IP Address or Name of Domain Management Server>`

## Syntax

```
fwm [-d] sic_reset
```

## Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d        | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.<br/>For complete debug instructions, see the description of the <code>fwm</code> process in <a href="#">sk97638</a>.</p> |

# fwm snmp\_trap

## Description

Sends an SNMPv1 Trap to the specified host.

## Notes:

- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsensv <IP Address or Name of Domain Management Server>
```

- On a Multi-Domain Server, the SNMP Trap packet is sent from the IP address of the Leading Interface.

## Syntax

```
fwm [-d] snmp_trap [-v <SNMP OID>] [-g <Generic Trap Number>] [-s  
<Specific Trap Number>] [-p <Source Port>] [-c <SNMP Community>]  
<Target> ["<Message>"]
```

## Parameters

| Parameter                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-d</code>                              | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> <p>For complete debug instructions, see the description of the <code>fwm</code> process in <a href="#">sk97638</a>.</p>                                                                                                            |
| <code>-v &lt;SNMP OID&gt;</code>             | Specifies an optional SNMP OID to bind with the message.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>-g &lt;Generic Trap Number&gt;</code>  | <p>Specifies the generic trap number.<br/>One of these values:</p> <ul style="list-style-type: none"> <li>▪ 0 - For <code>coldStart</code> trap</li> <li>▪ 1 - For <code>warmStart</code> trap</li> <li>▪ 2 - For <code>linkDown</code> trap</li> <li>▪ 3 - For <code>linkUp</code> trap</li> <li>▪ 4 - For <code>authenticationFailure</code> trap</li> <li>▪ 5 - For <code>egpNeighborLoss</code> trap</li> <li>▪ 6 - For <code>enterpriseSpecific</code> trap (this is the default value)</li> </ul> |
| <code>-s &lt;Specific Trap Number&gt;</code> | <p>Specifies the unique trap type.<br/>Valid only if generic trap value is 6 (for <code>enterpriseSpecific</code>).<br/>Default value is 0.</p>                                                                                                                                                                                                                                                                                                                                                         |
| <code>-p &lt;Source Port&gt;</code>          | Specifies the source port, from which to send the SNMP Trap packets.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>-c &lt;SNMP Community&gt;</code>       | Specifies the SNMP community.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>&lt;Target&gt;</code>                  | <p>Specifies the managed target host, to which to send the SNMP Trap packets.<br/>Enter an IP address of a resolvable hostname.</p>                                                                                                                                                                                                                                                                                                                                                                     |
| <code>"&lt;Message&gt;"</code>               | Specifies the SNMP Trap text message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Example - Sending an SNMP Trap from a Management Server and capturing the traffic on the Security Gateway

```
[Expert@MGMT:0]# fwm snmp_trap -g 2 -c public 192.168.3.52 "My Trap Message"
[Expert@MGMT:0]#

[Expert@MyGW_192.168.3.52:0]# tcpdump -s 1500 -vvvv -i eth0 udp and host 192.168.3.51
tcpdump: listening on eth0, link-type EN10MB (Ethernet), capture size 1500 bytes
22:49:43.891287 IP (tos 0x0, ttl 64, id 0, offset 0, flags [DF], proto: UDP (17), length: 103)
192.168.3.51.53450 > MyGW_192.168.3.52.snmptrap: [udp sum ok] { SNMPv1 { Trap(58) E:2620.1.1
192.168.3.240 linkDown 1486440 E:2620.1.1.11.0="My Trap Message" } }
Pressed CTRL+C
[Expert@MyGW_192.168.3.52:0]#
```

# fwm unload

## Description

Unloads the policy from the specified managed Security Gateways or Cluster Members.

### Warning:

1. The `fwm unload` command prevents all traffic from passing through the Security Gateway (Cluster Member), because it disables the IP Forwarding in the Linux kernel on the specified Security Gateway (Cluster Member).
2. The `fwm unload` command removes all policies from the specified Security Gateway (Cluster Member).

This means that the Security Gateway (Cluster Member) accepts all incoming connections destined to all active interfaces without any filtering or protection enabled.

### Notes:

- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsensv <IP Address or Name of Domain Management Server>
```

- If it is necessary to remove the current policy, but keep the Security Gateway (Cluster Member) protected, then run the ["comp\\_init\\_policy" on page 964](#) command on the Security Gateway (Cluster Member).
- To load the policies on the Security Gateway (Cluster Member), run one of these commands on the Security Gateway (Cluster Member), or reboot:
  - ["fw fetch" on page 1154](#)
  - ["cpstart" on page 1032](#)
- In addition, see the ["fw unloadlocal" on page 1279](#) command.

## Syntax

```
fwm [-d] unload <GW1> <GW2> ... <GWN>
```

## Parameters

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                       | <p>Runs the command in debug mode.</p> <p>Use only if you troubleshoot the command itself.</p> <p>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> <p>For complete debug instructions, see the description of the <code>fwm</code> process in <a href="#">sk97638</a>.</p> |
| <GW1> <GW2><br>... <GWN> | <p>Specifies the managed Security Gateways by their main IP address or Object Name as configured in SmartConsole.</p>                                                                                                                                                                                                                                                                           |

## Example

```
[Expert@MyGW:0]# cpstat -f policy fw

```

# fwm ver

## Description

Shows the Check Point version of the Security Management Server.

 **Note** - On a Multi-Domain Server, you can run this command:

- In the context of the MDS:

```
mdsend
```

- In the context of a Domain Management Server:

```
mdsend <IP Address or Name of Domain  
Management Server>
```

## Syntax

```
fwm [-d] ver [-f <Output File>]
```

## Parameters

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d               | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> <p>For complete debug instructions, see the description of the <code>fwm</code> process in <a href="#">sk97638</a>.</p> |
| -f <Output File> | Specifies the name of the output file, in which to save this information.                                                                                                                                                                                                                                                                                                                                                                                                      |

## Example

```
[Expert@MGMT:0]# fwm ver
This is Check Point Security Management Server R82.10 - Build 11
[Expert@MGMT:0]#
```

## fwm verify

**Important** - This command is obsolete for R80 and higher. Use the ["mgmt\\_cli" on page 386](#) command to verify a policy on a managed Security Gateway.

### Description

Verifies the specified policy package without installing it.

### Note

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsend <IP Address or Name of Domain Management Server>
```

### Syntax

```
fwm [-d] verify <Policy Name>
```

### Parameters

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d            | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.<br/>For complete debug instructions, see the description of the <code>fwm</code> process in <a href="#">sk97638</a>.</p> |
| <Policy Name> | Specifies the name of the policy package as configured in SmartConsole.                                                                                                                                                                                                                                                                                                                   |

### Example

```
[Expert@MGMT:0]# fwm verify Standard
Verifier messages:
Error: Rule 1 Hides rule 2 for Services & Applications: any .
[Expert@MGMT:0]#
```

# inet\_alert

## Description

Notifies an Internet Service Provider (ISP) when a company's corporate network is under attack. This command forwards log messages generated by the alert daemon on your Check Point Security Gateway to an external Management Station. This external Management Station is usually located at the ISP site. The ISP can then analyze the alert and react accordingly.

This command uses the Event Logging API (ELA) protocol to send the alerts. The Management Station receiving the alert must be running the ELA Proxy.

If communication with the ELA Proxy is to be authenticated or encrypted, a key exchange must be performed between the external Management Station running the ELA Proxy at the ISP site and the Check Point Security Gateway generating the alert.

## Procedure

| Step | Instructions                                                                                                                                                                                                          |
|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Connect with SmartConsole to the applicable Security Management Server or Domain Management Server, which manages the applicable Security Gateway that should forward log messages to an external Management Station. |
| 2    | From the top left <b>Menu</b> , click <b>Global properties</b> .                                                                                                                                                      |
| 3    | Click on the <b>[+]</b> near the <b>Log and Alert</b> and click <b>Alerts</b> .                                                                                                                                       |
| 4    | Clear the <b>Send user defined alert no. 1 to SmartView Monitor</b> .                                                                                                                                                 |
| 5    | Select the next option <b>Run UserDefined script under the above</b> .                                                                                                                                                |
| 6    | Enter the applicable <b>inet_alert</b> syntax (see the <i>Syntax</i> section below).                                                                                                                                  |
| 7    | Click <b>OK</b> .                                                                                                                                                                                                     |
| 8    | Install the Access Control Policy on the applicable Security Gateway.                                                                                                                                                 |

## Syntax

```
inet_alert -s <IP Address> [-o] [-a <Auth Type>] [-p <Port>] [-f <Token> <Value>] [-m <Alert Type>]
```

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Parameters

| Parameter                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-s &lt;IP Address&gt;</code>          | The IPv4 address of the ELA Proxy (usually located at the ISP site).                                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>-o</code>                             | Prints the alert log received to <code>stdout</code> .<br>Use this option when <code>inet_alert</code> is part of a pipe syntax ( <code>&lt;some command&gt;   inet_alert ...</code> ).                                                                                                                                                                                                                                                                                     |
| <code>-a &lt;Auth Type&gt;</code>           | Specifies the type of connection to the ELA Proxy.<br>One of these values: <ul style="list-style-type: none"> <li>■ <code>ssl_opsec</code> - The connection is authenticated and encrypted (this is the default).</li> <li>■ <code>auth_opsec</code> - The connection is authenticated.</li> <li>■ <code>clear</code> - The connection is neither authenticated, nor encrypted.</li> </ul>                                                                                  |
| <code>-p &lt;Port&gt;</code>                | Specifies the port number on the ELA proxy. Default port is 18187.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>-f &lt;Token&gt; &lt;Value&gt;</code> | A field to be added to the log, represented by a <code>&lt;Token&gt; &lt;Value&gt;</code> pair as follows: <ul style="list-style-type: none"> <li>■ <code>&lt;Token&gt;</code> - The name of the field to be added to the log. Cannot contain spaces.</li> <li>■ <code>&lt;Value&gt;</code> - The field's value. Cannot contain spaces.</li> </ul> <p>This option can be used multiple times to add multiple <code>&lt;Token&gt; &lt;Value&gt;</code> pairs to the log.</p> |

| Parameter                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-m &lt;Alert Type&gt;</code> | <p>The alert to be triggered at the ISP site.</p> <p>This alert overrides the alert specified in the log message generated by the alert daemon.</p> <p>The response to the alert is handled according to the actions specified in the ISP Security Policy:</p> <p>These alerts execute the OS commands:</p> <ul style="list-style-type: none"> <li>▪ <code>alert</code> - Popup alert command</li> <li>▪ <code>mail</code> - Mail alert command</li> <li>▪ <code>snmptrap</code> - SNMP trap alert command</li> <li>▪ <code>spoofalert</code> - Anti-Spoof alert command</li> </ul> <p>These NetQuota and ServerQuota alerts execute the OS commands specified in the <code>\$FWDIR/conf/objects.C</code> file:<br/> <code>value=clientquotaalert. Parameter=clientquotaalertcmd</code></p> |

## Exist Status

| Exit Status | Description                                              |
|-------------|----------------------------------------------------------|
| 0           | Execution was successful.                                |
| 102         | Undetermined error.                                      |
| 103         | Unable to allocate memory.                               |
| 104         | Unable to obtain log information from <code>stdin</code> |
| 106         | Invalid command line arguments.                          |
| 107         | Failed to invoke the OPSEC API.                          |

## Example

```
inet_alert -s 10.0.2.4 -a clear -f product cads -m alert
```

This command specifies to perform these actions in the event of an attack:

- Establish a clear connection with the ELA Proxy located at IP address 10.0.2.4
- Send a log message to the specified ELA Proxy. Set the product field of this log message to `cads`
- Trigger the OS command specified in the SmartConsole > **Menu** > **Global properties** > **Log and Alert** > **Popup Alert Command** field.

# ldapcmd

## Description

This is an LDAP utility that controls these features:

| Feature    | Description                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cache      | LDAP cache operations, such as emptying the cache, as well as providing debug information.                                                                                                                                                                                                                                                                                                                                  |
| Statistics | <p>LDAP search statistics, such as:</p> <ul style="list-style-type: none"> <li>▪ All user searches</li> <li>▪ Pending lookups (when two or more lookups are identical)</li> <li>▪ Total lookup time (the total search time for a specific lookup)</li> <li>▪ Cache statistics such as hits and misses</li> </ul> <p>These statistics are saved in the <code>\$FWDIR/log/ldap_pid_&lt;Process PID&gt;.stats</code> file.</p> |
| Logging    | View the alert and warning logs.                                                                                                                                                                                                                                                                                                                                                                                            |

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
ldapcmd [-d <Debug Level>] -p {<Process Name> | all} <Command>
```

## Parameters

| Parameter                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-d &lt;Debug Level&gt;</code>          | Runs the command in debug mode with the specified TDERROR debug level.<br>Valid values are from 0 (disabled) to 5 (maximum level, recommended).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>-p {&lt;Process Name&gt;   all}</code> | Runs on a specified Check Point process, or all supported Check Point processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

# ldapcompare

## Description

This is an LDAP utility that performs compare queries and prints a message whether the result returned a match or not.

This utility opens a connection to an LDAP directory server, binds, and performs the comparison specified on the command line or from a specified file.

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
ldapcompare [-d <Debug Level>] [<Options>] <DN> {<Attribute>
<Value> | <Attribute> <Base64 Value>}
```

## Parameters

| Parameter                           | Description                                                                                                                                     |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-d &lt;Debug Level&gt;</code> | Runs the command in debug mode with the specified TDERROR debug level.<br>Valid values are from 0 (disabled) to 5 (maximum level, recommended). |
| <code>&lt;Options&gt;</code>        | See the tables below: <ul style="list-style-type: none"> <li>■ Compare options</li> <li>■ Common options</li> </ul>                             |
| <code>&lt;DN&gt;</code>             | Specifies the Distinguished Name.                                                                                                               |
| <code>&lt;Attribute&gt;</code>      | Specifies the assertion attribute.                                                                                                              |
| <code>&lt;Value&gt;</code>          | Specifies the assertion value.                                                                                                                  |
| <code>&lt;Base64 Value&gt;</code>   | Specifies the Base64 encoding of the assertion value.                                                                                           |

## Compare options

| Option                                                              | Description                                                                                                                                                           |
|---------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-E [!]&lt;Extension&gt; [=&lt;Extension Parameter&gt;]</code> | Specifies the compare extensions.<br><b>Note</b> - The exclamation sign "!" indicates criticality.<br>For example: <code>!dontUseCopy</code> = Do <b>not</b> use Copy |
| <code>-M</code>                                                     | Enables the Manage DSA IT control.<br>Use the " <code>-MM</code> " option to make it critical.                                                                        |
| <code>-P &lt;LDAP Protocol Version&gt;</code>                       | Specifies the LDAP protocol version. Default version is 3.                                                                                                            |
| <code>-z</code>                                                     | Enables the quiet mode.<br>The command does not print anything. You can use the command return values.                                                                |

## Common options

| Option                          | Description                                                 |
|---------------------------------|-------------------------------------------------------------|
| <code>-D &lt;Bind DN&gt;</code> | Specifies the LDAP Server administrator Distinguished Name. |

| Option                                                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| -o <i>&lt;Option&gt; [=&lt;Option Parameter&gt;]</i> | Specifies the general options:<br>nettimeout={ <i>&lt;Timeout in Sec&gt;</i>   none   max}  |
| -O <i>&lt;Properties&gt;</i>                         | Specifies the SASL security properties.                                                     |
| -p <i>&lt;LDAP Server Port&gt;</i>                   | Specifies the LDAP Server port. Default is 389.                                             |
| -Q                                                   | Specifies to use the SASL Quiet mode.                                                       |
| -R <i>&lt;Realm&gt;</i>                              | Specifies the SASL realm.                                                                   |
| -U <i>&lt;Authentication Identity&gt;</i>            | Specifies the SASL authentication identity.                                                 |
| -v                                                   | Runs in verbose mode (prints the diagnostics to <i>stdout</i> ).                            |
| -V                                                   | Prints version information (use the "-vv" option only).                                     |
| -w <i>&lt;LDAP Admin Password&gt;</i>                | Specifies the LDAP Server administrator password (for simple authentication).               |
| -W                                                   | Specifies to prompt the user for the LDAP Server administrator password.                    |
| -x                                                   | Specifies to use simple authentication.                                                     |
| -X <i>&lt;Authorization Identity&gt;</i>             | Specifies the SASL authorization identity (either "dn:<DN>", or "u:<Username>" option).     |
| -y <i>&lt;File&gt;</i>                               | Specifies to read the LDAP Server administrator password from the <i>&lt;File&gt;</i> .     |
| -Y <i>&lt;SASL Mechanism&gt;</i>                     | Specifies the SASL mechanism.                                                               |
| -Z                                                   | Specifies to start the TLS request.<br>Use the "-ZZ" option to require successful response. |

# ldapmemberconvert

## Description

This is an LDAP utility that ports from the "Member" attribute values in LDAP group entries to the "MemberOf" attribute values in LDAP member (User or Template) entries.

This utility converts the LDAP server data to work in either the "MemberOf" mode, or "Both" mode. The utility searches through all specified group or template entries that hold one or more "Member" attribute values and modifies each value. The utility searches through all specified group/template entries and fetches their "Member" attribute values.

Each value is the DN of a member entry. The entry identified by this DN is added to the "MemberOf" attribute value of the group/template DN at hand. In addition, the utility delete those "Member" attribute values from the group/template, unless you run the command in the "Both" mode.

When you run the command, it creates a log file `ldapmemberconvert.log` in the current working directory. The command logs all modifications done and errors encountered in that log file.

**Important** - Back up the LDAP server database *before* you run this conversion utility.

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
ldapmemberconvert [-d <Debug Level>] -h <LDAP Server> -p <LDAP
Server Port> -D <LDAP Admin DN> -w <LDAP Admin Password> -m
<Member Attribute Name> -o <MemberOf Attribute Name> -c <Member
ObjectClass Value> [-B] [-f <File> | -g <Group DN>] [-L <LDAP
Server Timeout>] [-M <Number of Updates>] [-S <Size>] [-T <LDAP
Client Timeout>] [-Z]
```

## Parameters

| Parameter                                        | Description                                                                                                                                                                                                                                                                        |
|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-d &lt;Debug Level&gt;</code>              | Runs the command in debug mode with the specified TDERROR debug level.<br>Valid values are from 0 (disabled) to 5 (maximum level, recommended).                                                                                                                                    |
| <code>-h &lt;LDAP Server&gt;</code>              | Specifies the LDAP Server server by its IP address or resolvable hostname.<br>If you do not specify the LDAP Server explicitly, the command connects to <code>localhost</code> .                                                                                                   |
| <code>-p &lt;LDAP Server Port&gt;</code>         | Specifies the LDAP Server port. Default is 389.                                                                                                                                                                                                                                    |
| <code>-D &lt;LDAP Admin DN&gt;</code>            | Specifies the LDAP Server administrator Distinguished Name.                                                                                                                                                                                                                        |
| <code>-w &lt;LDAP Admin Password&gt;</code>      | Specifies the LDAP Server administrator password.                                                                                                                                                                                                                                  |
| <code>-m &lt;Member Attribute Name&gt;</code>    | Specifies the LDAP attribute name when fetching and (possibly) deleting a group Member attribute value.                                                                                                                                                                            |
| <code>-o &lt;MemberOf Attribute Name&gt;</code>  | Specifies the LDAP attribute name for adding an LDAP "memberOf" attribute value.                                                                                                                                                                                                   |
| <code>-c &lt;Member ObjectClass Value&gt;</code> | Specifies the LDAP "ObjectClass" attribute value that defines, which type of member to modify.<br>You can specify multiple attribute values with this syntax:<br><pre>-c &lt;Member Object Class 1&gt; -c &lt;Member Object Class 2&gt; ... -c &lt;Member Object Class N&gt;</pre> |
| <code>-B</code>                                  | Specifies to run in "Both" mode.                                                                                                                                                                                                                                                   |
| <code>-f &lt;File&gt;</code>                     | Specifies the file that contains a list of Group DNs separated by a new line:<br><pre>&lt;Group DN 1&gt; &lt;Group DN 2&gt; ... &lt;Group DN N&gt;</pre> Length of each line is limited to 256 characters.                                                                         |

| Parameter                                   | Description                                                                                                                                                                                                                                 |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-g &lt;Group DN&gt;</code>            | <p>Specifies the Group or Template Distinguished Name, on which to perform the conversion.</p> <p>You can specify multiple Group DNs with this syntax:</p> <pre>-g &lt;Group DN 1&gt; -g &lt;Group DN 2&gt; ... -g &lt;Group DN N&gt;</pre> |
| <code>-L &lt;LDAP Server Timeout&gt;</code> | <p>Specifies the Server side time limit for LDAP operations, in seconds.</p> <p>Default is "never".</p>                                                                                                                                     |
| <code>-M &lt;Number of Updates&gt;</code>   | <p>Specifies the maximum number of simultaneous member LDAP updates.</p> <p>Default is 20.</p>                                                                                                                                              |
| <code>-S &lt;Size&gt;</code>                | <p>Specifies the Server side size limit for LDAP operations, in number of entries.</p> <p>Default is "none".</p>                                                                                                                            |
| <code>-T &lt;LDAP Client Timeout&gt;</code> | <p>Specifies the Client side timeout for LDAP operations, in milliseconds.</p> <p>Default is "never".</p>                                                                                                                                   |
| <code>-Z</code>                             | <p>Specifies to use SSL connection.</p>                                                                                                                                                                                                     |

## Notes

There are two "GroupMembership" modes. You must keep these modes consistent:

- `template-to-groups`
- `user-to-groups`

For example, if you apply conversion on LDAP users to include the "memberOf" attributes for their groups, then this conversion has to be applied on LDAP defined templates for their groups.

## Troubleshooting

### *Symptom:*

A command fails with an error message stating the connection stopped unexpectedly when you run it with the parameter `-M <Number of Updates>`.

### *Root Cause:*

The LDAP server could not handle that many LDAP requests simultaneously and closed the connection.

### *Solution:*

Run the command again with a lower value for the `"-M"` parameter. The default value should be adequate, but can also cause a connection failure in extreme situations. Continue to reduce the value until the command runs normally. Each time you run the command with the same set of groups, the command continues from where it left off.

## Examples

### Example 1

A group is defined with the DN "cn=cpGroup, ou=groups, ou=cp, c=us" and these attributes:

```
...
cn=cpGroup
uniquemember="cn=member1, ou=people, ou=cp, c=us"
uniquemember="cn=member2, ou=people, ou=cp, c=us"
...
```

For the two member entries:

```
...
cn=member1
objectclass=fw1Person
...
```

and:

```
...
cn=member2
objectclass=fw1Person
...
```

Run:

```
[Expert@MGMT:0]# ldapconvert -g cn=cpGroup,ou=groups,ou=cp,c=us -h MyLdapServer -d cn=admin -w secret -m uniquemember -o memberof -c fw1Person
```

The result for the group DN is:

```
...
cn=cpGroup
...
```

The result for the two member entries is:

```
...
cn=member1
objectclass=fw1Person
memberof="cn=cpGroup,ou=groups,ou=cp,c=us"
...
```

and:

```
...
cn=member2
objectclass=fw1Person
memberof="cn=cpGroup,ou=groups,ou=cp,c=us"
...
```

If you run the same command with the "-B" parameter, it produces the same result, but the group entry is not modified.

## Example 2

If there is another member attribute value for the same group entry:

```
uniquemember="cn=templatel,ou=people, ou=cp,c=us"
```

and the template is:

```
cn=member1  
objectclass=fwlTemplate
```

Then after running the same command, the template entry stays intact, because of the parameter `"-c fwlPerson"`, but the object class of "templatel" is "fwlTemplate".

# ldapmodify

## Description

This is an LDAP utility that imports users to an LDAP server. The input file must be in the LDIF format.

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
ldapmodify [-d <Debug Level>] [-h <LDAP Server>] [-p <LDAP Server Port>] [-D <LDAP Admin DN>] [-w <LDAP Admin Password>] [-a] [-b] [-c] [-F] [-k] [-n] [-r] [-v] [-T <LDAP Client Timeout>] [-Z] [-f <Input File> .ldif | <<Entry>>]
```

## Parameters

| Parameter                                   | Description                                                                                                                                                                      |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-d &lt;Debug Level&gt;</code>         | Runs the command in debug mode with the specified TDERROR debug level.<br>Valid values are from 0 (disabled) to 5 (maximum level, recommended).                                  |
| <code>-h &lt;LDAP Server&gt;</code>         | Specifies the LDAP Server server by its IP address or resolvable hostname.<br>If you do not specify the LDAP Server explicitly, the command connects to <code>localhost</code> . |
| <code>-p &lt;LDAP Server Port&gt;</code>    | Specifies the LDAP Server port. Default is 389.                                                                                                                                  |
| <code>-D &lt;LDAP Admin DN&gt;</code>       | Specifies the LDAP Server administrator Distinguished Name.                                                                                                                      |
| <code>-w &lt;LDAP Admin Password&gt;</code> | Specifies the LDAP Server administrator password.                                                                                                                                |

| Parameter                             | Description                                                                                                                                                                                                |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -a                                    | Specifies that this is the LDAP "add" operation.                                                                                                                                                           |
| -b                                    | Specifies to read values from files (for binary attributes).                                                                                                                                               |
| -c                                    | Specifies to ignore errors during continuous operation.                                                                                                                                                    |
| -F                                    | Specifies to force changes on all records.                                                                                                                                                                 |
| -k                                    | Specifies the Kerberos bind.                                                                                                                                                                               |
| -K                                    | Specifies the Kerberos bind, part 1 only.                                                                                                                                                                  |
| -n                                    | Specifies to print the LDAP "add" operations, but do not actually perform them.                                                                                                                            |
| -r                                    | Specifies to replace values, instead of adding values.                                                                                                                                                     |
| -v                                    | Specifies to run in verbose mode.                                                                                                                                                                          |
| -T <i>&lt;LDAP Client Timeout&gt;</i> | Specifies the Client side timeout for LDAP operations, in milliseconds.<br>Default is "never".                                                                                                             |
| -Z                                    | Specifies to use SSL connection.                                                                                                                                                                           |
| -f <i>&lt;Input File&gt;.ldif</i>     | Specifies to read from the <i>&lt;Input File&gt;.ldif</i> file.<br>The input file must be in the LDIF format.                                                                                              |
| < <i>&lt;Entry&gt;</i>                | Specifies to read the entry from the <i>stdin</i> .<br>The "<" character is mandatory part of the syntax.<br>It specifies the input comes from the standard input (from the data you enter on the screen). |

# ldapsearch

## Description

This is an LDAP utility that queries an LDAP directory and returns the results.

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
ldapsearch [-d <Debug Level>] [-h <LDAP Server>] [-p <LDAP Port>]
[-D <LDAP Admin DN>] [-w <LDAP Admin Password>] [-A] [-B] [-b
<Base DN>] [-F <Separator>] [-l <LDAP Server Timeout>] [-s
<Scope>] [-S <Sort Attribute>] [-t] [-T <LDAP Client Timeout>] [-
u] [-z <Number of Search Entries>] [-Z] <Filter> [<Attributes>]
```

## Parameters

| Parameter                                   | Description                                                                                                                                                                      |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-d &lt;Debug Level&gt;</code>         | Runs the command in debug mode with the specified TDERROR debug level.<br>Valid values are from 0 (disabled) to 5 (maximum level, recommended).                                  |
| <code>-h &lt;LDAP Server&gt;</code>         | Specifies the LDAP Server server by its IP address or resolvable hostname.<br>If you do not specify the LDAP Server explicitly, the command connects to <code>localhost</code> . |
| <code>-p &lt;LDAP Port&gt;</code>           | Specifies the LDAP Server port. Default is 389.                                                                                                                                  |
| <code>-D &lt;LDAP Admin DN&gt;</code>       | Specifies the LDAP Server administrator Distinguished Name.                                                                                                                      |
| <code>-w &lt;LDAP Admin Password&gt;</code> | Specifies the LDAP Server administrator password.                                                                                                                                |
| <code>-A</code>                             | Specifies to retrieve attribute names only, without values.                                                                                                                      |

| Parameter                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-B</code>                                  | Specifies not to suppress the printing of non-ASCII values.                                                                                                                                                                                                                                                                                                                                                           |
| <code>-b &lt;Base DN&gt;</code>                  | Specifies the Base Distinguished Name (DN) for search.                                                                                                                                                                                                                                                                                                                                                                |
| <code>-F &lt;Separator&gt;</code>                | Specifies the print separator character between attribute names and their values.<br>The default separator is the equal sign (=).                                                                                                                                                                                                                                                                                     |
| <code>-l &lt;LDAP Server Timeout&gt;</code>      | Specifies the Server side time limit for LDAP operations, in seconds.<br>Default is "never".                                                                                                                                                                                                                                                                                                                          |
| <code>-s &lt;Scope&gt;</code>                    | Specifies the search scope. One of these: <ul style="list-style-type: none"> <li>■ base</li> <li>■ one</li> <li>■ sub</li> </ul>                                                                                                                                                                                                                                                                                      |
| <code>-S &lt;Sort Attribute&gt;</code>           | Specifies to sort the results by the values of this attribute.                                                                                                                                                                                                                                                                                                                                                        |
| <code>-t</code>                                  | Specifies to write values to files in the <code>/tmp/</code> directory.<br>Writes each <code>&lt;attribute&gt;-&lt;value&gt;</code> pair to a separate file named:<br><code>/tmp/ldapsearch-&lt;Attribute&gt;-&lt;Value&gt;</code><br>For example, for the <code>fwlcolor</code> attribute with the value <code>a00188</code> , the command writes to the file named:<br><code>/tmp/ldapsearch-fwlcolor-a00188</code> |
| <code>-T &lt;LDAP Client Timeout&gt;</code>      | Specifies the Client side timeout for LDAP operations, in milliseconds.<br>Default is never.                                                                                                                                                                                                                                                                                                                          |
| <code>-u</code>                                  | Specifies to show user-friendly entry names in the output.<br>For example:<br>shows <code>cn=Babs Jensen, users, omi</code><br>instead of <code>cn=Babs Jensen, cn=users, cn=omi</code>                                                                                                                                                                                                                               |
| <code>-z &lt;Number of Search Entries&gt;</code> | Specifies the maximum number of entries to search on the LDAP Server.                                                                                                                                                                                                                                                                                                                                                 |
| <code>-Z</code>                                  | Specifies to use SSL connection.                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>&lt;Filter&gt;</code>                      | LDAP search filter compliant with RFC-1558.<br>For example:<br><code>objectclass=fwlhost</code>                                                                                                                                                                                                                                                                                                                       |

| Parameter                       | Description                                                                                                                              |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;Attributes&gt;</code> | Specifies the list of attributes to retrieve.<br>If you do not specify attributes explicitly, then the command retrieves all attributes. |

## Example

```
[Expert@MGMT:0]# ldapsearch -p 18185 -b cn=omi objectclass=fwlhost objectclass
```

With this syntax, the command:

1. Connects to the LDAP Server to port 18185.
2. Connects to the LDAP Server with Base DN "cn=omi".
3. Queries the LDAP directory for "fwlhost" objects.
4. For each object found, prints the value of its "objectclass" attribute.

# mgmt\_cli

## Description

The `mgmt_cli` tool works directly with the management database on your Management Server.

## Syntax on Management Server or Security Gateway running on Gaia OS

```
mgmt_cli <Command Name> <Command Parameters> <Optional Switches>
```

## Syntax on SmartConsole computer running on Windows OS 32-bit

Open Windows Command Prompt and run these commands:

```
cd /d "%ProgramFiles%\CheckPoint\SmartConsole\<VERSION>\PROGRAM\"
mgmt_cli.exe <Command Name> <Command Parameters> <Optional
Switches>
```

## Syntax on SmartConsole computer running on Windows OS 64-bit

Open Windows Command Prompt and run these commands:

```
cd /d "%ProgramFiles
(x86)%\CheckPoint\SmartConsole\<VERSION>\PROGRAM\"
mgmt_cli.exe <Command Name> <Command Parameters> <Optional
Switches>
```

## Notes

- For a complete list of the `mgmt_cli` options, enter the `mgmt_cli (mgmt_cli.exe)` command and press Enter.
- For more information, see the [Check Point Management API Reference](#) (at the top, select the correct version) .

# migrate

**Important** - This command is used to migrate the management database from R80.10 and lower versions.

For more information, see the [R82.10 Installation and Upgrade Guide](#).

## Description

Exports the management database and applicable Check Point configuration.

Imports the exported management database and applicable Check Point configuration.

## **Backing up and restoring in Management High Availability environment:**

- To back up and restore a consistent environment, make sure to collect and restore the backups and snapshots from all servers in the High Availability environment at the same time.
- Make sure other administrators do not make changes in SmartConsole until the backup operation is completed.

For more information:

- About Gaia Backup and Gaia Snapshot, see the [R82.10 Gaia Administration Guide](#).
- About Virtual Machine Snapshots, see the vendor documentation.

## **Notes:**

- You must run this command from the Expert mode.
- If it is necessary to back up the current management database, and you do **not** plan to import it on a Management Server that runs a higher software version, then you can use the built-in command in the `$FWDIR/bin/upgrade_tools/` directory.
- If you plan to import the management database on a Management Server that runs a higher software version, then you must use the `migrate` utility from the migration tools package created specifically for that higher software version. See the **Installation and Upgrade Guide** for that higher software version.
- If this command completes successfully, it creates this log file:  
`/var/log/opt/CPshrd-R82.10/migrate-<YYYY.MM.DD_HH.MM.SS>.log`  
 For example: `/var/log/opt/CPshrd-R82.10/migrate-2019.06.14_11.03.46.log`
- If this command fails, it creates this log file:  
`$CPDIR/log/migrate-<YYYY.MM.DD_HH.MM.SS>.log`  
 For example: `/opt/CPshrd-R82.10/log/migrate-2019.06.14_11.21.39.log`

## Syntax

- To see the built-in help:

```
[Expert@MGMT:0]# ./migrate -h
```

- To export the management database and configuration:

```
[Expert@MGMT:0]# cd $FWDIR/bin/upgrade_tools/
[Expert@MGMT:0]# yes | nohup ./migrate export [-l | -x] [-n]
[--exclude-uepm-postgres-db] [--include-uepm-msi-files] /<Full
Path>/<Name of Exported File> &
```

- To import the management database and configuration:

```
[Expert@MGMT:0]# cd $FWDIR/bin/upgrade_tools/
[Expert@MGMT:0]# yes | nohup ./migrate import [-l | -x] [-n]
[--exclude-uepm-postgres-db] [--include-uepm-msi-files] /<Full
Path>/<Name of Exported File>.txz &
```

## Parameters

| Parameter                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -h                                | Shows the built-in help.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <i>&lt;Name of Exported File&gt;</i> | <ul style="list-style-type: none"> <li>During the export operation, specifies the name of the output file.<br/>The command automatically adds the *.txz extension.</li> <li>During the import operation, specifies the name of the exported file.<br/>You must manually enter the *.txz extension in the end.</li> </ul> |

### Example 1 - Export operation succeeded

```
[Expert@MGMT:0]# cd $FWDIR/bin/upgrade_tools/
[Expert@MGMT:0]# ./migrate export /var/log/Migrate_Export

You are required to close all clients to Security Management Server
or execute 'cpstop' before the Export operation begins.

Do you want to continue? (y/n) [n]? y

Copying required files...
Compressing files...

The operation completed successfully.

Location of archive with exported database: /var/log/Migrate_Export.txz

[Expert@MGMT:0]#
[Expert@MGMT:0]# find / -name migrate-\* -type f
/var/log/opt/CPshrd-R82.10/migrate-2019.06.14_11.03.46.log
[Expert@MGMT:0]#
```

### Example 2 - Export operation failed

```
[Expert@MGMT:0]# ./migrate export /var/log/My_Migrate_Export
Execution finished with errors. See log file '/opt/CPshrd-R82.10/log/migrate-2019.06.14_
11.21.39.log' for further details
[Expert@MGMT:0]#
```

# migrate\_server

**Important** - This command is used to migrate the management database from R80.20.M1, R80.20, R80.20.M2, R80.30, and higher versions.

For more information, see:

- [sk135172 - Upgrade Tools](#)
- The [R82.10 Installation and Upgrade Guide](#)

## Description

Exports the management database and applicable Check Point configuration.

Imports the exported management database and applicable Check Point configuration.

**Backing up and restoring in Management High Availability environment:**

- To back up and restore a consistent environment, make sure to collect and restore the backups and snapshots from all servers in the High Availability environment at the same time.
- Make sure other administrators do not make changes in SmartConsole until the backup operation is completed.

For more information:

- About Gaia Backup and Gaia Snapshot, see the [R82.10 Gaia Administration Guide](#).
- About Virtual Machine Snapshots, see the vendor documentation.

## Notes:

- You must run this command from the Expert mode.
- If it is necessary to back up the current management database, and you do **not** plan to import it on a Management Server that runs a higher software version, then you can use the built-in command in the `$FWDIR/scripts/` directory.
- If you plan to import the management database on a Management Server that runs a higher software version, then you must use the `migrate_server` utility from the migration tools package created specifically for that higher software version. See the **Installation and Upgrade Guide** for that higher software version.
- If this command completes successfully, it creates this log file:  
`/var/log/opt/CPshrd-R82.10/migrate-<YYYY.MM.DD_HH.MM.SS>.log`  
 For example: `/var/log/opt/CPshrd-R82.10/migrate-2022.06.14_11.03.46.log`
- If this command fails, it creates this log file:  
`$CPDIR/log/migrate-<YYYY.MM.DD_HH.MM.SS>.log`  
 For example: `/opt/CPshrd-R82.10/log/migrate-2025 - 2026.06.14_11.21.39.log`

 **Important** - If it is necessary to back up the current management database, and you do **not** plan to import it on a Management Server that runs a higher software version, then you must make sure the source Management Server and the target Management Server run the same Jumbo Hotfix Accumulator Take and all other private hotfixes.

To see all the installed software packages, you can run this command: `cpinfo -y all`

## Syntax

- To see the built-in help:

```
[Expert@MGMT:0]# cd $FWDIR/scripts/
[Expert@MGMT:0]# ./migrate_server -h
```

- To see the build number of the installed Upgrade Tools package:

```
[Expert@MGMT:0]# cd $FWDIR/scripts/
[Expert@MGMT:0]# ./migrate_server print_installed_tools -v
R82.10
```

- To run the Pre-Upgrade Verifier:

```
[Expert@MGMT:0]# cd $FWDIR/scripts/
[Expert@MGMT:0]# ./migrate_server verify -v R82.10 [-skip_
upgrade_tools_check]
```

- To export the management database and configuration:

```
[Expert@MGMT:0]# cd $FWDIR/scripts/
[Expert@MGMT:0]# ./migrate_server export -v R82.10 [-skip_
upgrade_tools_check] [-l | -x] [--include-uepm-msi-files] [--
exclude-uepm-postgres-db] [--ignore_warnings] /<Full
Path>/<Name of Exported File>
```

- To import the management database and configuration:

```
[Expert@MGMT:0]# cd $FWDIR/scripts/
[Expert@MGMT:0]# ./migrate_server import -v R82.10 [-skip_
upgrade_tools_check] [-l | -x] [/var/log/mdss.json] [--
include-uepm-msi-files] [--exclude-uepm-postgres-db] /<Full
Path>/<Name of Exported File>.tgz
```

- To import the Domain Management Server database and configuration on a Security Management Server:

```
[Expert@MGMT:0]# cd $FWDIR/scripts/
[Expert@MGMT:0]# ./migrate_server migrate_import_domain -v
R82.10 [-skip_upgrade_tools_check] [-l | -x]
[/var/log/mdss.json] [--include-uepm-msi-files] [--exclude-
uepm-postgres-db] /<Full Path>/<Name of Exported File>.tgz
```

## Parameters

| Parameter                                                  | Description                                                    |
|------------------------------------------------------------|----------------------------------------------------------------|
| -h                                                         | Shows the built-in help.                                       |
| <code>print_<br/>installed_<br/>tools -v<br/>R82.10</code> | Shows the build number of the installed Upgrade Tools package. |

| Parameter                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <code>-prepare_background</code>                          | Prepares upgrade in background.                                                                                                                                                                                                                                                                                                                                                         |
| <code>-cancel_prepare</code>                              | Cancels upgrade preparation.                                                                                                                                                                                                                                                                                                                                                            |
| <code>-grace_period &lt;Minutes&gt;</code>                | Grace period before starting upgrade completion.                                                                                                                                                                                                                                                                                                                                        |
| <code>-o &lt;Path to File&gt;</code>                      | Path to the archived file from which to import the database.                                                                                                                                                                                                                                                                                                                            |

| Parameter                                             | Description                                    |
|-------------------------------------------------------|------------------------------------------------|
| <code>-sn &lt;Name of Domain Server&gt;</code>        | Name of the Domain Management Server.          |
| <code>-dsi &lt;IP address of Domain Server&gt;</code> | IP address of the Management Server.           |
| <code>-skip_logs</code>                               | Skip the import of logs (without log indexes). |

### Example 1 - Export operation succeeded

```
[Expert@MGMT:0]# cd $FWDIR/scripts/
[Expert@MGMT:0]# ./migrate_server export -v R82.10 /var/log/Migrate_Export

You are required to close all clients to Security Management Server
or execute 'cpstop' before the Export operation begins.

Do you want to continue? (y/n) [n]? y

Copying required files...
Compressing files...

The operation completed successfully.

Location of archive with exported database: /var/log/Migrate_Export.tgz

[Expert@MGMT:0]#
[Expert@MGMT:0]# find / -name migrate-* -type f
/var/log/opt/CPshrd-R82.10/migrate-2025 - 2026.06.14_11.03.46.log
[Expert@MGMT:0]#
```

### Example 2 - Export operation failed

```
[Expert@MGMT:0]# ./migrate_server export /var/log/My_Migrate_Export
Execution finished with errors. See log file '/opt/CPshrd-R82.10/log/migrate-2025 - 2026.06.14_11.21.39.log' for further details
[Expert@MGMT:0]#
```

# queryDB\_util

## Description

Searches in the management database for objects or policy rules.

 **Important** - This command is obsolete for R80 and higher. Use the ["mgmt\\_cli" on page 386](#) command to search in the management database for objects or policy rules according to search parameters.

# rs\_db\_tool

## Description

Manages Dynamically Assigned IP address (DAIP) gateways in a DAIP database.

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

- To add an entry to the DAIP database:

```
[Expert@MGMT:0]# rs_db_tool [-d] -operation add -name <Object Name> -ip <IPv4 Address> -ip6 <Pv6 Address> -TTL <Time-To-Live>
```

- To fetch a specific entry from the DAIP database:

```
[Expert@MGMT:0]# rs_db_tool [-d] -operation fetch -name <Object Name>
```

- To delete a specific entry from the DAIP database:

```
[Expert@MGMT:0]# rs_db_tool [-d] -operation delete -name <Object Name>
```

- To list all entries in the DAIP database:

```
[Expert@MGMT:0]# rs_db_tool [-d] -operation list
```

- To synchronize the DAIP database:

```
[Expert@MGMT:0]# rs_db_tool [-d] -operation sync
```

**Note** - You must run this command from the Expert mode.

## Parameters

| Parameter           | Description                                                                                                                                                                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                  | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> |
| -name <Object Name> | Specifies the name of the DAIP object.                                                                                                                                                                                                                               |
| -ip <IPv4 Address>  | Specifies the IPv4 address of the DAIP object                                                                                                                                                                                                                        |
| -ip6 <IPv6 Address> | Specifies the IPv6 address of the DAIP object.                                                                                                                                                                                                                       |
| -TTL <Time-To-Live> | Specifies the relative time interval (in seconds), during which the entry is valid.                                                                                                                                                                                  |

# sam\_alert

## Description

For SAM v1, this utility executes Suspicious Activity Monitoring (SAM) actions according to the information received from the standard input.

For SAM v2, this utility executes Suspicious Activity Monitoring (SAM) actions with User Defined Alerts mechanism.

### Important:

- You must run this command on the Management Server.
- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsend <IP Address or Name of Domain Management Server>
```

### Notes:

- VSX Gateways and VSX Cluster Members do **not** support Suspicious Activity Monitoring (SAM) Rules. See [sk79700](#).
- See the ["fw sam" on page 295](#) and ["fw sam\\_policy" on page 303](#) commands.

## SAM v1 syntax

```
sam_alert [-v] [-o] [-s <SAM Server>] [-t <Time>] [-f <Security Gateway>] [-C] {-n|-i|-I} {-src|-dst|-any|-srv}
```

## Parameters for SAM v1

| Parameter       | Description                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------------------|
| -v              | Enables the verbose mode for the "fw sam" command.                                                    |
| -o              | Specifies to print the input of this tool to the standard output (to use with pipes in a CLI syntax). |
| -s <SAM Server> | Specifies the SAM Server to be contacted. Default is "localhost".                                     |
| -t <Time>       | Specifies the time (in seconds), during which to enforce the action. The default is forever.          |

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -f<br><Security Gateway> | Specifies the Security Gateway / Cluster object, on which to run the operation.<br> <b>Important</b> - If you do not specify the target Security Gateway / Cluster object explicitly, this command applies to all managed Security Gateways and Clusters. |
| -C                       | Cancels the specified operation.                                                                                                                                                                                                                                                                                                           |
| -n                       | Specifies to notify every time a connection, which matches the specified criteria, passes through the Security Gateway / ClusterXL / Security Group.                                                                                                                                                                                       |
| -i                       | Inhibits (drops or rejects) connections that match the specified criteria.                                                                                                                                                                                                                                                                 |
| -I                       | Inhibits (drops or rejects) connections that match the specified criteria and closes all existing connections that match the specified criteria.                                                                                                                                                                                           |
| -src                     | Matches the source address of connections.                                                                                                                                                                                                                                                                                                 |
| -dst                     | Matches the destination address of connections.                                                                                                                                                                                                                                                                                            |
| -any                     | Matches either the source or destination address of connections.                                                                                                                                                                                                                                                                           |
| -srv                     | Matches specific source, destination, protocol and port.                                                                                                                                                                                                                                                                                   |

## SAM v2 syntax

```
sam_alert -v2 [-v] [-O] [-S <SAM Server>] [-t <Time>] [-f
<Security Gateway>] [-n <Name>] [-c "<Comment>"] [-o
<Originator>] [-l {r | a}] -a {d | r | n | b | q | i} [-C] {-ip
|-eth} {-src|-dst|-any|-srv}
```

## Parameters for SAM v2

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                  |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -v2                   | Specifies to use SAM v2.                                                                                                                                                                                                                                                                                                                     |
| -v                    | Enables the verbose mode for the "fw sam" command.                                                                                                                                                                                                                                                                                           |
| -O                    | Specifies to print the input of this tool to the standard output (to use with pipes in a CLI syntax).                                                                                                                                                                                                                                        |
| -S <SAM Server>       | Specifies the SAM server to be contacted. Default is "localhost".                                                                                                                                                                                                                                                                            |
| -t <Time>             | Specifies the time (in seconds), during which to enforce the action. The default is forever.                                                                                                                                                                                                                                                 |
| -f <Security Gateway> | Specifies the Security Gateway / Cluster object, on which to run the operation.<br> <b>Important</b> - If you do not specify the target Security Gateway / Cluster object explicitly, this command applies to all managed Security Gateways and Clusters. |
| -n <Name>             | Specifies the name for the SAM rule.<br>Default is empty.                                                                                                                                                                                                                                                                                    |
| -c "<Comment>"        | Specifies the comment for the SAM rule.<br>Default is empty.<br>You must enclose the text in the double quotes or single quotes.                                                                                                                                                                                                             |
| -o <Originator>       | Specifies the originator for the SAM rule.<br>Default is "sam_alert".                                                                                                                                                                                                                                                                        |

| Parameter                               | Description                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-l {r   a}</code>                 | <p>Specifies the log type for connections that match the specified criteria:</p> <ul style="list-style-type: none"> <li>▪ <code>r</code> - Regular</li> <li>▪ <code>a</code> - Alert</li> </ul> <p>Default is <code>None</code>.</p>                                                                                                                 |
| <code>-a {d   r   n   b   q   i}</code> | <p>Specifies the action to apply on connections that match the specified criteria:</p> <ul style="list-style-type: none"> <li>▪ <code>d</code> - Drop</li> <li>▪ <code>r</code> - Reject</li> <li>▪ <code>n</code> - Notify</li> <li>▪ <code>b</code> - Bypass</li> <li>▪ <code>q</code> - Quarantine</li> <li>▪ <code>i</code> - Inspect</li> </ul> |
| <code>-C</code>                         | Specifies to close all existing connections that match the criteria.                                                                                                                                                                                                                                                                                 |
| <code>-ip</code>                        | Specifies to use IP addresses as criteria parameters.                                                                                                                                                                                                                                                                                                |
| <code>-eth</code>                       | Specifies to use MAC addresses as criteria parameters.                                                                                                                                                                                                                                                                                               |
| <code>-src</code>                       | Matches the source address of connections.                                                                                                                                                                                                                                                                                                           |
| <code>-dst</code>                       | Matches the destination address of connections.                                                                                                                                                                                                                                                                                                      |
| <code>-any</code>                       | Matches either the source or destination address of connections.                                                                                                                                                                                                                                                                                     |
| <code>-srv</code>                       | Matches specific source, destination, protocol and port.                                                                                                                                                                                                                                                                                             |

## Example

See [sk110873: How to configure Security Gateway to detect and prevent port scan.](#)

# stattest

## Description

Check Point AMON client to query SNMP OIDs.

You can use this command as an alternative to the standard SNMP commands for debug purposes - to make sure the applicable SNMP OIDs provide the requested information.

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsensv <IP Address or Name of Domain Management Server>
```

## Syntax to query a Regular OID

- On a Management Server / Security Gateway / Cluster Member:

```
stattest get [-d] [-h <Host>] [-p <Port>] [-x <Proxy Server>] [-v <VSID>] [-t <Timeout>] <Regular_OID_1> <Regular_OID_2> ...  
<Regular_OID_N>
```

- On a Scalable Platform Security Group:

```
g_all stattest get [-d] [-h <Host>] [-p <Port>] [-x <Proxy Server>] [-v <VSID>] [-t <Timeout>] <Regular_OID_1> <Regular_OID_2>  
... <Regular_OID_N>
```

### Notes:

- These Regular OIDs are specified in the SNMP MIB files.
- For Check Point MIB files, see [sk90470](#).

## Syntax to query a Statistical OID

- On a Management Server / Security Gateway / Cluster Member:

```
stattest get [-d] [-h <Host>] [-p <Port>] [-x <Proxy Server>] -l <Polling Interval> -r <Polling Duration> [-v <VSID>] [-t <Timeout>] <Statistical_OID_1> <Statistical_OID_2> ... <Statistical_OID_N>
```

- On a Scalable Platform Security Group:

```
g_all stattest get [-d] [-h <Host>] [-p <Port>] [-x <Proxy Server>] -l <Polling Interval> -r <Polling Duration> [-v <VSID>] [-t <Timeout>] <Statistical_OID_1> <Statistical_OID_2> ... <Statistical_OID_N>
```

### Notes:

- These Statistical OIDs take some time to "initialize".
- For example, to calculate an average, it is necessary to collect enough samples.
- Check Point statistical OIDs are registered in the `$CPDIR/conf/statistical_oid.conf` file.

### Parameters

| Parameter                                | Description                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-d</code>                          | <p>Runs the command in debug mode. Use only if you troubleshoot the command itself.</p> <p> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> |
| <code>-h &lt;Host&gt;</code>             | Specifies the remote Check Point host to query by its IP address or resolvable hostname.                                                                                                                                                                                                                                                           |
| <code>-p &lt;Port&gt;</code>             | Specifies the port number, on which the AMON server listens. Default port is 18192.                                                                                                                                                                                                                                                                |
| <code>-x &lt;Proxy Server&gt;</code>     | <p>Specifies the Proxy Server by its IP address or resolvable hostname.</p> <p> <b>Note</b> - Use only when you query a remote host.</p>                                                                                                                        |
| <code>-l &lt;Polling Interval&gt;</code> | <p>Specifies the time in seconds between queries.</p> <p> <b>Note</b> - Use only when you query a Statistical OID.</p>                                                                                                                                          |

| Parameter                                                                                              | Description                                                                                                                                                                                                                                                                                                           |
|--------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <code>&lt;Statistical_OID_1&gt;<br/>&lt;Statistical_OID_2&gt; ...<br/>&lt;Statistical_OID_N&gt;</code> | Specifies the Statistical OIDs to query.<br> <b>Notes:</b> <ul style="list-style-type: none"> <li>▪ OID must not start with period.</li> <li>▪ Separate the OIDs with spaces.</li> <li>▪ You can specify up to 100 OIDs.</li> </ul> |

### Example - Query a Regular OID

Query the CPU Idle utilization at the OID 1.3.6.1.4.1.2620.1.6.7.2.3 (`procIdleTime`).

```
[Expert@HostName]# stattest get 1.3.6.1.4.1.2620.1.6.7.4.2
```

### Example - Query a Statistical OID

Query the CPU Idle utilization at the OID 1.3.6.1.4.1.2620.1.6.7.2.3 (`procIdleTime`).

Information is collected with intervals of 5 seconds during 5 seconds

```
[Expert@HostName]# stattest get -l 5 -r 5 1.3.6.1.4.1.2620.1.6.7.2.3
```

# threshold\_config

## Description

You can configure a variety of different SNMP thresholds that generate SNMP traps, or alerts.

You can use these thresholds to monitor many system components automatically without requesting information from each object or device.

You configure these SNMP Monitoring Thresholds only on the Security Management Server, Multi-Domain Server, or Domain Management Server.

During policy installation, the managed a Security Gateway and Clusters receive and apply these thresholds as part of their policy.

For more information, see [sk90860: How to configure SNMP on Gaia OS](#).

## Procedure

| Step | Instructions                                                                                                                                                                                 |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Connect to the command line on the Management Server.                                                                                                                                        |
| 2    | Log in to the Expert mode.                                                                                                                                                                   |
| 3    | On a Multi-Domain Server, switch to the context of the applicable Domain Management Server:<br><pre>[Expert@HostName:0]# mdsenv &lt;Name or IP address of Domain Management Server&gt;</pre> |
| 4    | Go to the Threshold Engine Configuration menu:<br><pre>[Expert@HostName:0]# threshold_config</pre>                                                                                           |

| Step | Instructions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Thresholds Categories

| Category                      | Sub-Categories                                                                                                                                                                               |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| (1) Hardware                  | <pre> Hardware Thresholds: ----- (1) RAID volume state (2) RAID disk state (3) RAID disk flags (4) Temperature sensor reading (5) Fan speed sensor reading (6) Voltage sensor reading </pre> |
| (2) High Availability         | <pre> High Availability Thresholds: ----- (1) Cluster member state changed (2) Cluster block state (3) Cluster state (4) Cluster problem status (5) Cluster interface status </pre>          |
| (3) Local Logging Mode Status | <pre> Local Logging Mode Status Thresholds: ----- (1) Local Logging Mode </pre>                                                                                                              |
| (4) Log Server Connectivity   | <pre> Log Server Connectivity Thresholds: ----- (1) Connection with log server (2) Connection with all log servers </pre>                                                                    |

| Category       | Sub-Categories                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| (5) Networking | <p>Networking Thresholds:</p> <p>-----</p> <ul style="list-style-type: none"> <li>(1) Interface Admin Status</li> <li>(2) Interface removed</li> <li>(3) Interface Operational Link Status</li> <li>(4) New connections rate</li> <li>(5) Concurrent connections rate</li> <li>(6) Bytes Throughput</li> <li>(7) Accepted Packet Rate</li> <li>(8) Drop caused by excessive traffic</li> </ul> |
| (6) Resources  | <p>Resources Thresholds:</p> <p>-----</p> <ul style="list-style-type: none"> <li>(1) Swap Memory Utilization</li> <li>(2) Real Memory Utilization</li> <li>(3) Partition free space</li> <li>(4) Core Utilization</li> <li>(5) Core interrupts rate</li> </ul>                                                                                                                                 |

**Notes:**

- If you run the `threshold_config` command *locally* on a Security Gateway or Cluster Members to configure the SNMP Monitoring Thresholds, then each policy installation erases these *local* SNMP threshold settings and reverts them to the *global* SNMP threshold settings configured on the Management Server that manages this Security Gateway or Cluster.
- On a Security Gateway and Cluster Members, you can save the local Threshold Engine Configuration settings to a file and load it locally later.
- The Threshold Engine Configuration is stored in the `$FWDIR/conf/thresholds.conf` file.
- In a Multi-Domain Security Management environment:
  - You can configure the SNMP thresholds in the context of Multi-Domain Server (MDS) and in the context of each individual Domain Management Server.
  - Thresholds that you configure in the context of the Multi-Domain Server are for the Multi-Domain Server only.
  - Thresholds that you configure in the context of a Domain Management Server are for that Domain Management Server and its managed Security Gateway and Clusters.
  - If an SNMP threshold applies both to the Multi-Domain Server and a Domain Management Server, then configure the SNMP threshold both in the context of the Multi-Domain Server and in the context of the Domain Management Server.  
However, in this scenario you can only get alerts from the Multi-Domain Server, if the monitored object exceeds the threshold.  
Example:  
If you configure the CPU threshold, then when the monitored value exceeds the configured threshold, it applies to both the Multi-Domain Server and the Domain Management Server. However, only the Multi-Domain Server generates SNMP alerts.

# Multi-Domain Security Management Commands

For more information about Multi-Domain Server, see the [R82.10 Multi-Domain Security Management Administration Guide](#).

In addition, see *"Security Management Server Commands" on page 42*.

# Managing Security through API

This section describes the API Server on a Management Server and the applicable API Tools.

## API

You can configure and manage the Management Server through API Requests that you send to the API Server that runs on the Management Server.

The API Server can automate daily tasks and integrate Check Point solutions with 3rd-party systems, such as virtualization, ticketing, and change management systems.

To learn more about the management APIs, to see code samples, and to take advantage of user forums, see:

- The API Documentation:
  - Online - [Check Point Management API Reference](#) (at the top, select the correct version)
  - Local - `https://<IP Address of Management Server>/api_docs`

By default, access to the local API Documentation is disabled. Follow the instructions in [sk174606](#).

**Note** - On a Standalone server (a server which runs both a Security Management Server and a Security Gateway), the API Documentation web portal (`https://<IP Address of Management Server>/api_docs`) stops working when you open SmartView Web Application (`https://<IP Address of Management Server>/smartview`).

- The **Developers Network** section of [Check Point CheckMates Community](#).

## API Tools

You can run the required API commands on the Management Server in these ways:

- From the Command Line dialog in the SmartConsole GUI application (bottom left corner).
- From the command line on the Management Server with the "mgmt\_cli" command in the Expert mode.
- From the command line on the Management Server with the "mgmt" command in Gaia Clish.
- From the command line on the SmartConsole client host with the "mgmt\_cli.exe" tool (installed as part of SmartConsole for Windows OS).

## Configuring the API Server

To configure the API Server:

1. Connect with SmartConsole to the Security Management Server or applicable Domain Management Server.
2. From the left navigation panel, click **Manage & Settings**.
3. In the upper left section, click **Blades**.
4. In the **Management API** section, click **Advanced Settings**.

The **Management API Settings** window opens.

5. Configure the **Startup Settings** and the **Access Settings**.

### Configuring Startup Settings

Select **Automatic start** to automatically start the API server when you start or reboot the Management Server.

#### Notes:

- If the Management Server has more than 4GB of RAM installed, the **Automatic start** option is activated by default during the Management Server installation.
- If the Management Server has less than 4GB of RAM, the **Automatic start** option is deactivated.

## Configuring Access Settings

Select one of these options to configure which clients can connect to the API Server:

- **Management server only**

Only the Management Server itself can connect to the API Server.

This option only lets you use the `mgmt_cli` utility on the Management Server command line to send API requests.

You cannot use SmartConsole or Web services to send API requests.

- **All IP addresses that can be used for GUI clients**

You can send API requests from all IP addresses that are defined in SmartConsole > **Permissions & Administrators** > **Trusted Clients**.

This includes requests from SmartConsole, Web services, and the `mgmt_cli` utility on the Management Server.

- **All IP addresses**

You can send API requests from all IP addresses.

This includes requests from SmartConsole, Web services, and the `mgmt_cli` utility on the Management Server.

6. Click **OK**.
7. In the upper left section, click **Permissions & Administrators**.
8. In the object of each applicable Administrator, make sure the assigned Permission Profile allows access to Management API.

### Instructions

- a. Edit the Administrator object.
- b. In the left panel, click **General**.
- c. In the **Permissions** section, on the right side of the selected Permission Profile, click the eye icon.

The Permission Profile object opens in the read-only view.
- d. In the left panel, click **Management**.
- e. The permission **Management API Login** has to be selected.

If it is not selected, then close this window and edit this Permission Profile object.
- f. Click **Close**.

9. Publish the SmartConsole session.
10. Restart the API Server on the Management Server with this command:

```
api restart
```

 **Notes:**

- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

- The output of this command must show:

```
API started successfully
```

11. Examine the status of the API server on the Management Server with this command:

```
api status
```

**Notes:**

- The output of this command must show:

```
-----
Overall API Status: Started
-----

API readiness test SUCCESSFUL. The server is up and ready
to receive connections
```

- The output of this command may show the state of the "API" process as "Stopped" when the API access is set to "All IP addresses that can be used for GUI clients", and more than 200 Trusted Clients are configured:

```
Processes:

Name          State      PID      More Information
-----
API           Stopped   ...
```

## Discarding API Sessions with Locks or Pending Changes

Open SmartConsole and API sessions that contain locks or unpublished changes are not automatically discarded. As a result, some sessions can remain open for extended periods.

The `ENABLE_DISCARD_WORKSESSIONS_OLDER_THAN_DAYS` environment variable controls whether stale open sessions are automatically discarded. By default, this variable is disabled, and open sessions with locks or unpublished changes remain available until they are manually discarded.

When enabled, the Security Management Server periodically evaluates open sessions and discards sessions that exceed the configured age threshold.

### To configure automatic discard of stale sessions:

1. Connect to the Security Management Server or Multi-Domain Server using SSH.
2. Switch to Expert mode.
3. To enable automatic discard of open sessions that contain locks or unpublished changes, set `ENABLE_DISCARD_WORKSESSIONS_OLDER_THAN_DAYS` to "true".

Run:

```
MDS_FWDIR/scripts/reload_env_vars.sh -e "ENABLE_DISCARD_
WORKSESSIONS_OLDER_THAN_DAYS=true"
```

```
$MDS_FWDIR/scripts/override_server_setting.sh -e ENABLE_DISCARD_
WORKSESSIONS_OLDER_THAN_DAYS true
```

4. By default, only sessions which are open for more than 60 days are automatically discarded. To configure the number of days after which sessions are discarded, run:

```
$MDS_FWDIR/scripts/reload_env_vars.sh -e "DISCARD_WORKSESSIONS_
OLDER_THAN_DAYS=<Number_of_Days>" $MDS_FWDIR/scripts/override_
server_setting.sh -e DISCARD_WORKSESSIONS_OLDER_THAN_DAYS
<Number_of_Days>
```

For example, to set the threshold to 30 days, run:

```
$MDS_FWDIR/scripts/reload_env_vars.sh -e "DISCARD_WORKSESSIONS_
OLDER_THAN_DAYS=30"
```

```
$MDS_FWDIR/scripts/override_server_setting.sh -e DISCARD_
WORKSESSIONS_OLDER_THAN_DAYS 30
```

### Result:

When `ENABLE_DISCARD_WORKSESSIONS_OLDER_THAN_DAYS` is set to "true":

- The Security Management Server checks all open SmartConsole and API sessions one time per day.
- If a session remains open longer than the number of days configured in `DISCARD_WORKSESSIONS_OLDER_THAN_DAYS`, the session is automatically discarded.

# cma\_migrate

## Description

On the applicable target Domain Management Server, imports the management database that was exported from an R7x Domain Management Server.

 **Note** - This command updates the database schema before it imports. First, the command runs pre-upgrade verification. If no errors are found, migration continues. If there are errors, you must fix them on the source R7x Domain Management Server according to instructions in the error messages. Then do this procedure again.

For the complete procedure, see the [R82.10 Installation and Upgrade Guide](#).

## Syntax

```
cma_migrate /<Full Path>/<Name of R7x Domain Exported File>.tgz  
/<Full Path>/<$FWDIR Directory of the New Domain Management  
Server>/
```

## Example

```
[Expert@R82.10_MDS:0]# cma_migrate /var/log/orig_R7x_database.tgz  
/opt/CPmds-R82.10/customers/MyDomain3/CPsuite-R82.10/fw1/
```

# contract\_util

## Description

Works with the Check Point Service Contracts.

For more information about Service Contract files, see [sk33089: What is a Service Contract File?](#)

## Syntax

```
contract_util [-d]
    check <options>
    cpmacro <options>
    download <options>
    mgmt
    print <options>
    summary <options>
    update <options>
    verify
```

## Parameters

| Parameter             | Description                                                                                                                                                                               |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| check<br><options>    | Checks whether the Security Gateway is eligible for an upgrade.<br>See <a href="#">"contract_util check" on page 50</a> .                                                                 |
| cpmacro<br><options>  | Overwrites the current <code>cp.macro</code> file with the specified <code>cp.macro</code> file.<br>See <a href="#">"contract_util cpmacro" on page 51</a> .                              |
| download<br><options> | Downloads all associated Check Point Service Contracts from the User Center, or from a local file.<br>See <a href="#">"contract_util download" on page 52</a> .                           |
| mgmt                  | Delivers the Service Contract information from the Management Server to the managed Security Gateways.<br>See <a href="#">"contract_util mgmt" on page 54</a> .                           |
| print<br><options>    | Shows all the installed licenses and whether the Service Contract covers these license, which entitles them for upgrade or not.<br>See <a href="#">"contract_util print" on page 55</a> . |

| Parameter            | Description                                                                                                                                                                                                  |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| update<br><options>  | Updates Check Point Service Contracts from your User Center account.<br>See <a href="#">"contract_util update" on page 57</a> .                                                                              |
| verify               | Checks whether the Security Gateway is eligible for an upgrade.<br>This command also interprets the return values and shows a meaningful message.<br>See <a href="#">"contract_util verify" on page 58</a> . |

# contract\_util check

## Description

Checks whether the Security Gateway is eligible for an upgrade.

For more information about Service Contract files, see [sk33089: What is a Service Contract File?](#)

## Syntax

```
contract_util check
  {-h | -help}
  hfa
  maj_upgrade
  min_upgrade
  upgrade
```

## Parameters

| Parameter    | Description                                                                                    |
|--------------|------------------------------------------------------------------------------------------------|
| {-h   -help} | Shows the applicable built-in usage.                                                           |
| hfa          | Checks whether the Security Gateway is eligible for an upgrade to a higher Hotfix Accumulator. |
| maj_upgrade  | Checks whether the Security Gateway is eligible for an upgrade to a higher Major version.      |
| min_upgrade  | Checks whether the Security Gateway is eligible for an upgrade to a higher Minor version.      |
| upgrade      | Checks whether the Security Gateway is eligible for an upgrade.                                |

# contract\_util cpmacro

## Description

Overwrites the current `cp_macro` file with the specified `cp_macro` file, if the specified is newer than the current file.

For more information about the `cp_macro` file, see [sk96217: What is a cp\\_macro file?](#)

## Syntax

```
contract_util cpmacro /<path_to>/cp_macro
```

This command shows one of these messages:

| Message                                | Description                                                                                                                                                                                                                        |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CntrctUtils_Write_cp_macro returned -1 | The <code>contract_util cpmacro</code> command failed: <ul style="list-style-type: none"><li>Failed to create a temporary file.</li><li>Failed to write to a temporary file.</li><li>Failed to replace the current file.</li></ul> |
| CntrctUtils_Write_cp_macro returned 0  | The <code>contract_util cpmacro</code> command was able to overwrite the current file with the specified file, because the specified file is newer.                                                                                |
| CntrctUtils_Write_cp_macro returned 1  | The <code>contract_util cpmacro</code> command did not overwrite the current file, because it is newer than the specified file.                                                                                                    |

# contract\_util download

## Description

Downloads all associated Check Point Service Contracts from User Center, or from a local file.

For more information about Service Contract files, see [sk33089: What is a Service Contract File?](#)

## Syntax

```
contract_util download
    {-h | -help}
    local
        {-h | -help}
        [{hfa | maj_upgrade | min_upgrade | upgrade}] <Service
Contract File>
    uc
        {-h | -help}
        [-i] [{hfa | maj_upgrade | min_upgrade | upgrade}]
<Username> <Password> [<Proxy Server> [<Proxy Username>:<Proxy
Password>]]
```

## Parameters

| Parameter                                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

# contract\_util mgmt

## Description

Delivers the Service Contract information from the Management Server to the managed Security Gateways.

For more information about Service Contract files, see [sk33089: What is a Service Contract File?](#)

## Syntax

```
contract_util mgmt
```

# contract\_util print

## Description

Shows all the installed licenses and whether the Service Contract covers these license, which entitles them for upgrade or not.

This command can show which licenses are not recognized by the Service Contract file.

For more information about Service Contract files, see [sk33089: What is a Service Contract File?](#)

## Syntax

```
contract_util [-d] print
               {-h | -help}
               hfa
               maj_upgrade
               min_upgrade
               upgrade
```

## Parameters

| Parameter    | Description                                          |
|--------------|------------------------------------------------------|
| {-h   -help} | Shows the applicable built-in usage.                 |
| -d           | Shows a formatted table header and more information. |
| hfa          | Shows the information about Hotfix Accumulator.      |
| maj_upgrade  | Shows the information about Major version.           |
| min_upgrade  | Shows the information about Minor version.           |
| upgrade      | Shows the information about an upgrade.              |

# contract\_util summary

## Description

Shows post-installation summary and whether this Check Point server is eligible for upgrades.

## Syntax

```
contract_util summary  
    hfa  
    maj_upgrade  
    min_upgrade  
    upgrade
```

## Parameters

| Parameter   | Description                                     |
|-------------|-------------------------------------------------|
| hfa         | Shows the information about Hotfix Accumulator. |
| maj_upgrade | Shows the information about Major version.      |
| min_upgrade | Shows the information about Minor version.      |
| upgrade     | Shows the information about an upgrade.         |

# contract\_util update

## Description

Updates the Check Point Service Contracts from your User Center account.

For more information about Service Contract files, see [sk33089: What is a Service Contract File?](#)

## Syntax

```
contract_util update
  [-proxy <Proxy Server>:<Proxy Port>]
  [-ca_path <Path to ca-bundle.crt File>]
```

## Parameters

| Parameter                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                |

# contract\_util verify

## Description

Checks whether the Security Gateway is eligible for an upgrade.

This command is the same as the "[contract\\_util check](#)" on page 50 command, but it also interprets the return values and shows a meaningful message.

For more information about Service Contract files, see [sk33089: What is a Service Contract File?](#)

## Syntax

```
contract_util verify
```

# cp\_conf

## Description

Configures or reconfigures a Check Point product installation.

**Note** - The available options for each Check Point server depend on the configuration and installed products.

## Syntax on a Management Server

```
cp_conf
  -h
  admin <options>
  auto <options>
  ca <options>
  client <options>
  finger <options>
  lic <options>
  snmp <options>
```

## Syntax on a Security Gateway / each Cluster Member in Gaia Clish or the Expert mode

```
cp_conf
  -h
  adv_routing <options>
  auto <options>
  corexl <options>
  fullha <options>
  ha <options>
  intfs <options>
  lic <options>
  sic <options>
  snmp <options>
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cp_conf
  -h
  adv_routing <options>
  auto <options>
  corexl <options>
  fullha <options>
  ha <options>
  intfs <options>
  lic <options>
  sic <options>
  snmp <options>
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cp_conf
  -h
  adv_routing <options>
  auto <options>
  corexl <options>
  fullha <options>
  ha <options>
  intfs <options>
  lic <options>
  sic <options>
  snmp <options>
```

## Parameters

| Parameter                | Description                                                                                                                                                                                                                                                                                                                         |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -h                       | Shows the entire built-in usage.                                                                                                                                                                                                                                                                                                    |
| admin<br><options>       | Configures Check Point system administrators for the Security Management Server.<br>See <a href="#">"cp_conf admin" on page 63</a> .                                                                                                                                                                                                |
| adv_routing<br><options> | Enables or disables the Advanced Routing feature on this Security Gateway.<br> <b>Important</b> - Do not use these outdated commands. To configure Advanced Routing, see the <a href="#">R82.10 Gaia Advanced Routing Administration Guide</a> . |

| Parameter           | Description                                                                                                                                                                                                                                                            |

| sic<br><options>    | Manages SIC on this Security Gateway / Cluster Member / Security Group.<br>See <a href="#">"cp_conf sic" on page 1000</a> .                                                                                                                                            |

| Parameter         | Description                                                                                                                                                                          |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| snmp<br><options> | Do <b>not</b> use these outdated commands.<br>To configure SNMP, see the <a href="#">R82.10 Gaia Administration Guide</a> - Chapter <i>System Management</i> - Section <i>SNMP</i> . |

# cp\_conf admin

## Description

Configures Check Point system administrators for the Security Management Server.

### Notes:

- Multi-Domain Server does not support this command.
- Only one administrator can be defined in the *"cpconfig" on page 133* menu. To define additional administrators, use SmartConsole.
- This command corresponds to the option **Administrator** in the *"cpconfig" on page 133* menu.

## Syntax

```
cp_conf admin
  -h
  add [<UserName> <Password> {a | w | r}]
  add -gaia [{a | w | r}]
  del <UserName1> <UserName2> ...
  get
```

## Parameters

| Parameter                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -h                                         | Shows the applicable built-in usage.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| del <UserName1><br><UserName2> ...         | Deletes the specified system administrators.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| get                                        | Shows the list of the configured system administrators.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| get -gaia                                  | Shows the management permissions assigned to the Gaia administrator user <code>admin</code> .                                                                                                                                                                                                                                                                                                                                                                                                   |

## Example 1 - Adding a Check Point system administrator

```
[Expert@MGMT:0]# cp_conf admin add
Administrator name: admin
Administrator admin already exists.
Do you want to change Administrator's Permissions (y/n) [n] ? y

Permissions for all products (Read/[W]rite All, [R]ead Only All, [C]ustomized) c
    Permission for SmartUpdate (Read/[W]rite, [R]ead Only, [N]one) w
    Permission for Monitoring (Read/[W]rite, [R]ead Only, [N]one) w

Administrator admin was modified successfully and has
Read/Write Permission for SmartUpdate
Read/Write Permission for Monitoring
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf admin get

The following Administrators
are defined for this Security Management Server:

admin (Read/Write Permission for all products; )
[Expert@MGMT:0]#
```

## Example 2 - Adding the Gaia administrator user

```
[Expert@MGMT:0]# cp_conf admin add -gaia
Permissions for all products (Read/[W]rite All, [R]ead Only All, [C]ustomized) c
    Permission for SmartUpdate (Read/[W]rite, [R]ead Only, [N]one) w
    Permission for Monitoring (Read/[W]rite, [R]ead Only, [N]one) w
Administrator admin was added successfully and has
Read/Write Permission for SmartUpdate
Read/Write Permission for Monitoring
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf admin get -gaia

The following Administrators
are defined for this Security Management Server:

admin (Read/Write Permission for all products; ) - Gaia admin
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf admin add -gaia a
Administrator admin already exists.

Administrator admin was modified successfully and has
Read/Write Permission for all products with Permission to Manage Administrators
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf admin add -gaia w
Administrator admin already exists.

Administrator admin was modified successfully and has
Read/Write Permission for all products without Permission to Manage Administrators
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf admin add -gaia r
Administrator admin already exists.

Administrator admin was modified successfully and has
Read Only Permission for all products
[Expert@MGMT:0]#
```

# cp\_conf auto

## Description

Shows and controls which of Check Point products start automatically during boot.

-  **Note** - This command corresponds to the option **Automatic start of Check Point Products** in the "[cpconfig](#)" on page 133 menu.
-  **Note** - On a Multi-Domain Server, use the option **Automatic Start of Multi-Domain Server** in the "[mdsconfig](#)" on page 763 menu.

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cp_conf auto
    -h
    {enable | disable} <Product1> <Product2> ...
    get all
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cp_conf auto
    -h
    {enable | disable} <Product1> <Product2> ...
    get all
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cp_conf auto
    -h
    {enable | disable} <Product1> <Product2> ...
    get all
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cp_conf auto
    -h
    {enable | disable} <Product1> <Product2> ...
    get all
```

## Parameters

| Parameter                                       | Description                                                                                                                                                                                                                 |
|-------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -h                                              | Shows the applicable built-in usage.                                                                                                                                                                                        |
| {enable   disable}<br><Product1> <Product2> ... | Controls whether the installed Check Point products start automatically during boot. This command is for Check Point use only.                                                                                              |
| get all                                         | Shows which of these Check Point products start automatically during boot: <ul style="list-style-type: none"> <li>■ Check Point Security Gateway</li> <li>■ QoS (former FloodGate-1)</li> <li>■ SmartEvent Suite</li> </ul> |

### Example from a Security Management Server

```
[Expert@MGMT:0]# cp_conf auto get all
Check Point Security Gateway is not installed

QoS is not installed

The SmartEvent Suite will start automatically at boot time.

[Expert@MGMT:0]#
```

### Example from a Security Gateway

```
[Expert@GW:0] cp_conf auto get all
The Check Point Security Gateway will start automatically at boot time.

QoS will start automatically at boot time.

SmartEvent Suite is not installed.

[Expert@GW:0]#
```

# cp\_conf ca

## Description

This command changes the settings of the Internal Certificate Authority (ICA).

 **Note** - On a Security Management Server, this command corresponds to the option **Certificate Authority** in the ["cpconfig" on page 133](#) menu.

 **Note:**  
On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsend <IP Address or Name of Domain Management Server>
```

## Syntax

```
cp_conf ca
    -h
    fqdn <FQDN Name>
    init
```

## Parameters

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -h               | Shows the applicable built-in usage.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| fqdn <FQDN Name> | <p>Configures the Fully Qualified Domain Name (FQDN) for the Internal Certificate Authority (ICA).</p> <p>The "&lt;FQDN Name&gt;" is the text string in this format:<br/><i>hostname.domainname</i></p> <p> <b>Notes:</b></p> <ul style="list-style-type: none"> <li>■ The existing certificates for configured objects are <b>not</b> revoked.</li> <li>■ The existing ICA certificate is <b>not</b> changed.</li> <li>■ The Management Server uses the specified "&lt;FQDN Name&gt;" to configure the Certificate Revocation List Distribution Point (CRL DP) property in all certificates that the ICA generates. Refer to this command: <a href="#">"cpca_client get_crl dp" on page 107</a></li> </ul> |
| init             | Initializes the Internal Certificate Authority (ICA).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Example

```
[Expert@MyMGMT:0]# hostname
MyMGMT
[Expert@MyMGMT:0]#

[Expert@MyMGMT:0]# domainname
checkpoint.com
[Expert@MyMGMT:0]#

[Expert@MyMGMT:0]# cp_conf ca fqdn MyMGMT.checkpoint.com
Trying to contact Certificate Authority. It might take a while...
Certificate was created successfully
MyMGMT.checkpoint.com was successfully set to the Internal CA
[Expert@MyMGMT:0]#
```

# cp\_conf client

## Description

Configures the GUI clients that are allowed to connect with SmartConsoles to the Security Management Server.

### Notes:

- Multi-Domain Server does not support this command.
- This command corresponds to the option **GUI Clients** in the "[cpconfig](#)" on [page 133](#) menu.

## Syntax

```
cp_conf client
  add <GUI Client>
  createlist <GUI Client 1> <GUI Client 2> ...
  del <GUI Client 1> <GUI Client 2> ...
  get
```

## Parameters

| Parameter                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -h                                              | Shows the built-in usage.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <GUI Client>                                    | <p>&lt;GUI Client&gt; can be one of these:</p> <ul style="list-style-type: none"> <li>■ One IPv4 address (for example, 192.168.10.20), or one IPv6 address (for example, 3731:54:65fe:2::a7)</li> <li>■ One hostname (for example, MyComputer)</li> <li>■ "Any" - To denote all IPv4 and IPv6 addresses without restriction</li> <li>■ A range of IPv4 addresses (for example, 192.168.10.0/255.255.255.0), or a range of IPv6 addresses (for example, 2001::1/128)</li> <li>■ IPv4 address wildcard (for example, 192.168.10.*)</li> </ul> |
| add <GUI Client>                                | Adds a GUI client.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| createlist <GUI Client 1><br><GUI Client 2> ... | Deletes the current allowed GUI clients and creates a new list of allowed GUI clients.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| del <GUI Client 1> <GUI Client 2> ...           | Deletes the specified the GUI clients.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| get                                             | Shows the allowed GUI clients.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Examples

### Example 1 - Configure one IPv4 address

```
[Expert@MGMT:0]# cp_conf client get
There are no GUI Clients defined for this Security Management Server
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client add 172.20.168.15
172.20.168.15 was successfully added.
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client get
172.20.168.15
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client del 172.20.168.15
172.20.168.15 was deleted successfully
[Expert@MGMT:0]#
```

## Example 2 - Configure one hostname

```
[Expert@MGMT:0]# cp_conf client get
There are no GUI Clients defined for this Security Management Server
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client add MySmartConsoleHost
MySmartConsoleHost was successfully added.
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client get
MySmartConsoleHost
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client del MySmartConsoleHost
MySmartConsoleHost was deleted successfully
[Expert@MGMT:0]#
```

## Example 3 - Configure "Any"

```
[Expert@MGMT:0]# cp_conf client get
There are no GUI Clients defined for this Security Management Server
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client add "Any"
Any was successfully added.
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client get
Any
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client del "Any"
Any was deleted successfully
[Expert@MGMT:0]#
```

## Example 4 - Configure a range of IPv4 addresses

```
[Expert@MGMT:0]# cp_conf client get
There are no GUI Clients defined for this Security Management Server
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client add 172.20.168.0/255.255.255.0
172.20.168.0/255.255.255.0 was successfully added.
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client get
172.20.168.0/255.255.255.0
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client del 172.20.168.0/255.255.255.0
172.20.168.0/255.255.255.0 was deleted successfully
[Expert@MGMT:0]#
```

### Example 5 - Configure IPv4 address wildcard

```
[Expert@MGMT:0]# cp_conf client get
There are no GUI Clients defined for this Security Management Server
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client add 172.20.168.*
172.20.168.* was successfully added.
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client get
172.20.168.*
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client del 172.20.168.*
172.20.168.* was deleted successfully
[Expert@MGMT:0]#
```

### Example 6 - Delete the current list and create a new list of allowed GUI clients

```
[Expert@MGMT:0]# cp_conf client get
There are no GUI Clients defined for this Security Management Server
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client add 172.20.168.0/255.255.255.0
172.20.168.0/255.255.255.0 was successfully added.
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client get
172.20.168.0/255.255.255.0
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client createlist 192.168.40.0/255.255.255.0 172.30.40.55
New list was created successfully
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client get
192.168.40.0/255.255.255.0
172.30.40.55
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client createlist "Any"
New list was created successfully
[Expert@MGMT:0]#

[Expert@MGMT:0]# cp_conf client get
Any
[Expert@MGMT:0]#
```

# cp\_conf finger

## Description

Shows the Internal Certificate Authority's Fingerprint.

This fingerprint is a text string derived from the ICA certificate on the Security Management Server, Multi-Domain Server, or Domain Management Server.

This fingerprint verifies the identity of the Security Management Server, Multi-Domain Server, or Domain Management Server when you connect to it with SmartConsole.

 **Note** - This command corresponds to the option **Certificate's Fingerprint** in the *"cpconfig" on page 133* menu.

 **Note** - On a Multi-Domain Server:

- To see the fingerprint of the Multi-Domain Server, this command corresponds to the option **Certificate's Fingerprint** in the *"mdsconfig" on page 763* menu.
- You can run this command in these contexts:
  - To see the fingerprint of the Multi-Domain Server, run it in the context of the Multi-Domain Server:

```
mdsenv
```

- To see the fingerprint of a Domain Management Server, run it in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
cp_conf finger
    -h
    get
```

## Parameters

| Parameter | Description                          |
|-----------|--------------------------------------|
| -h        | Shows the applicable built-in usage. |
| get       | Shows the ICA's Fingerprint.         |

## Example

```
[Expert@MGMT:0]# cp_conf finger get  
EDNA COCO MOLE ATOM ASH MOT SAGE NINE ILL TINT HI CUBE  
[Expert@MGMT:0]#
```

## cp\_conf lic

### Description

Shows, adds and deletes Check Point licenses.

 **Note** - This command corresponds to the option **Licenses and contracts** in the *"cpconfig" on page 133* menu.

 **Note:**  
On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cp_conf lic
-h
add -f <Full Path to License File>
add -m <Host> <Date> <Signature Key> <SKU/Features>
del <Signature Key>
get [-x]
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cp_conf lic
-h
add -f <Full Path to License File>
add -m <Host> <Date> <Signature Key> <SKU/Features>
del <Signature Key>
get [-x]
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cp_conf lic
-h
add -f <Full Path to License File>
add -m <Host> <Date> <Signature Key> <SKU/Features>
del <Signature Key>
get [-x]
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cp_conf lic
-h
add -f <Full Path to License File>
add -m <Host> <Date> <Signature Key> <SKU/Features>
del <Signature Key>
get [-x]
```

## Parameters

| Parameter                                                 | Description                                                                                                                                                                                                                    |
|-----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -h                                                        | Shows the applicable built-in usage.                                                                                                                                                                                           |
| add -f <Full Path to License File>                        | <p>Adds a license from the specified Check Point license file.</p> <p>You get this license file in the <a href="#">Check Point User Center</a>.</p> <p>This is the same command as the <i>"cplic db_add" on page 143</i>.</p>  |
| add -m <Host> <Date><br><Signature Key><br><SKU/Features> | <p>Adds the license manually.</p> <p>You get these license details in the <a href="#">Check Point User Center</a>.</p> <p>This is the same command as the <i>"cplic db_add" on page 143</i>.</p>                               |
| del <Signature Key>                                       | <p>Delete the license based on its signature.</p> <p>This is the same command as the <i>"cplic del" on page 148</i>.</p>                                                                                                       |
| get [-x]                                                  | <p>Shows the local installed licenses.</p> <p>If you specify the "-x" parameter, output also shows the signature key for every installed license.</p> <p>This is the same command as the <i>"cplic print" on page 152</i>.</p> |

### Example 1 - Adding the license from the file

```
[Expert@HostName:0]# cp_conf lic add -f ~/License.lic
License was installed successfully.
[Expert@HostName:0]#

[Expert@HostName:0]# cp_conf lic get
Host          Expiration  Signature                                     Features
192.168.3.28   25Aug2019   xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx  CPMP-XXX
[Expert@HostName:0]#
```

## Example 2 - Adding the license manually

```
[Expert@MyHostName:0]# cp_conf lic add -m MyHostName 25Aug2019
xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx CPMP-XXX
License was successfully installed
[Expert@MyHostName:0]#

[Expert@MyHostName:0]# cp_conf lic get
Host          Expiration  Signature                                     Features
192.168.3.28   25Aug2019   xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx  CPMP-XXX
[Expert@MyHostName:0]#
```

# cp\_log\_export

## Description

Exports Check Point logs over syslog.

For more information, see [sk122323](#) and [R82.10 Logging and Monitoring Administration Guide](#).

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsensv <IP Address or Name of Domain Management Server>
```

## Syntax

```
cp_log_export
```

```
cp_log_export <command-name> help
```

## Parameters

| Parameter           | Description                                              |
|---------------------|----------------------------------------------------------|
| No Parameters       | Shows the built-in general help.                         |
| <command-name> help | Shows the built help for the specified internal command. |

## Internal Commands

| Name     | Description                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| add      | <p>Configures a new Check Point Log Exporter.</p> <pre>cp_log_export add name &lt;Name&gt; target-server &lt;Target-Server&gt; target-port &lt;Target-Server-Port&gt; protocol {udp   tcp} [Optional Arguments]</pre>                                                                                                                                                                                                                    |
| delete   | <p>Removes an existing Log Exporter.</p> <pre>cp_log_export delete name &lt;Name&gt;</pre>                                                                                                                                                                                                                                                                                                                                               |
| reexport | <p>Resets the current log position and exports all logs again based on the configuration.</p> <pre>cp_log_export reexport name &lt;Name&gt; --apply-now</pre> <pre>cp_log_export reexport name &lt;Name&gt; start-position &lt;Position of Last Exported Log&gt; --apply-now</pre> <pre>cp_log_export reexport name &lt;Name&gt; start-position &lt;Position of Gap Start&gt; end-position &lt;Position of Gap End&gt; --apply-now</pre> |
| restart  | <p>Restarts a Log Exporter process.</p> <pre>cp_log_export restart name &lt;Name&gt;</pre>                                                                                                                                                                                                                                                                                                                                               |
| set      | <p>Updates an existing Log Exporter configuration.</p> <pre>cp_log_export set name &lt;Name&gt; [&lt;Optional Arguments&gt;]</pre>                                                                                                                                                                                                                                                                                                       |
| show     | <p>Shows the current Log Exporter configuration.</p> <pre>cp_log_export show [&lt;Optional Arguments&gt;]</pre>                                                                                                                                                                                                                                                                                                                          |
| start    | <p>Starts an existing Log Exporter process.</p> <pre>cp_log_export start name &lt;Name&gt;</pre>                                                                                                                                                                                                                                                                                                                                         |
| status   | <p>Shows a Log Exporter overview status.</p> <pre>cp_log_export status [&lt;Optional Arguments&gt;]</pre>                                                                                                                                                                                                                                                                                                                                |
| stop     | <p>Stops an existing Log Exporter process.</p> <pre>cp_log_export stop name &lt;Name&gt;</pre>                                                                                                                                                                                                                                                                                                                                           |

## Internal Command Arguments

| Name                                              | Description                                                                                                                                                                                                                                  | Required for "add" command | Required for "set" command | Required for "delete" command | Required for "reconf" command | Required for "restart", "show", "status", "start", "stop" command | Required for "reexport" command |

# cpca\_client

## Description

Execute operations on the Internal Certificate Authority (ICA).

 **Note:**  
On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

mdsenv <IP Address or Name of Domain Management Server>

## Syntax

```
cpca_client [-d]
    create_cert <options>
    double_sign <options>
    get_crldp <options>
    get_pubkey <options>
    init_certs <options>
    lscert <options>
    recreate_crls
    revoke_cert <options>
    revoke_non_exist_cert <options>
    search <options>
    set_ca_services <options>
    set_cert_validity <options>
    set_mgmt_tool <options>
    set_sign_hash <options>
```

## Parameters

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                               |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                    | <p>Runs the command in debug mode.</p> <p>Use only if you troubleshoot the command itself.</p> <p> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> |
| create_cert <options> | <p>Issues a SIC certificate for the Security Management Server or Domain Management Server.</p> <p>See "<a href="#">cpca_client create_cert</a>" on page 103.</p>                                                                                                                                                                                         |

| Parameter                                       | Description                                                                                                                                                                                                                            |
|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>double_sign</code><br><options>           | Creates a second signature for a certificate.<br>See <a href="#">"cpca_client double_sign" on page 105</a> .                                                                                                                           |
| <code>get_crl_dp</code><br><options>            | Shows how to access a CRL file from a CRL Distribution Point.<br>See <a href="#">"cpca_client get_crl_dp" on page 107</a> .                                                                                                            |
| <code>get_pubkey</code><br><options>            | Saves the encoding of the public key of the ICA's certificate to a file.<br>See <a href="#">"cpca_client get_pubkey" on page 109</a> .                                                                                                 |
| <code>init_certs</code><br><options>            | Imports a list of DNs for users and creates a file with registration keys for each user.<br>See <a href="#">"cpca_client init_certs" on page 110</a> .                                                                                 |
| <code>lscert</code><br><options>                | Shows all certificates issued by the ICA.<br>See <a href="#">"cpca_client lscert" on page 111</a> .                                                                                                                                    |
| <code>recreate_crls</code>                      | Recreates all CRLs in the Internal CA database after you manually remove expired certificates from the Internal CA database as described in <a href="#">sk42424</a> .<br>See <a href="#">"cpca_client recreate_crls" on page 114</a> . |
| <code>revoke_cert</code><br><options>           | Revokes a certificate issued by the ICA.<br>See <a href="#">"cpca_client revoke_cert" on page 115</a> .                                                                                                                                |
| <code>revoke_non_exist_cert</code><br><options> | Revokes a non-existent certificate issued by the ICA.<br>See <a href="#">"cpca_client revoke_non_exist_cert" on page 118</a> .                                                                                                         |
| <code>search</code><br><options>                | Searches for certificates in the ICA.<br>See <a href="#">"cpca_client search" on page 119</a> .                                                                                                                                        |
| <code>set_ca_services</code><br><options>       | Controls the Certificate Authority Services Portal.<br>See <a href="#">"cpca_client set_ca_services" on page 122</a> .                                                                                                                 |
| <code>set_cert_validity</code><br><options>     | Configures the default certificate validity period for new certificates.<br>See <a href="#">"cpca_client set_cert_validity" on page 124</a> .                                                                                          |
| <code>set_mgmt_tool</code><br><options>         | Controls the ICA Management Tool.<br>See <a href="#">"cpca_client set_mgmt_tool" on page 125</a> .                                                                                                                                     |
| <code>set_sign_hash</code><br><options>         | Sets the hash algorithm that the CA uses to sign the file hash.<br>See <a href="#">"cpca_client set_sign_hash" on page 130</a> .                                                                                                       |

# cpca\_client create\_cert

## Description

Issues a SIC certificate for the Security Management Server or Domain Management Server.

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
cpca_client [-d] create_cert [-p <CA port number>] -n "CN=<Common Name>" -f <Full Path to PKCS12 file> [-w <Password>] [-k {SIC | USER | IKE | ADMIN_PKG}] [-c "<Comment for Certificate>"] [-s <2048 | 3072 | 4096>]
```

## Parameters

| Parameter                         | Description                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                                | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| -p <CA port number>               | Specifies the TCP port on the Security Management Server or Domain Management Server, which is used to connect to the Certificate Authority.<br>The default TCP port number is 18209.                                                                                                                                                    |
| -n "CN=<Common Name>"             | Sets the CN to the specified <Common Name>.                                                                                                                                                                                                                                                                                              |
| -f <Full Path to PKCS12 file>     | Specifies the PKCS12 file, which stores the certificate and keys.                                                                                                                                                                                                                                                                        |
| -w <Password>                     | Optional. Specifies the certificate password.                                                                                                                                                                                                                                                                                            |
| -k {SIC   USER   IKE   ADMIN_PKG} | Optional. Specifies the certificate kind.                                                                                                                                                                                                                                                                                                |
| -c "<Comment for Certificate>"    | Optional. Specifies the certificate comment (must enclose in double quotes).                                                                                                                                                                                                                                                             |
| -s <2048   3072   4096>           | Optional. Specifies the length of the RSA key size in bits.                                                                                                                                                                                                                                                                              |

## Example

```
[Expert@MGMT:0]# cpa_client create_cert -n "cn=cp_mgmt" -f $CPDIR/conf/sic_cert.p12
```

# cpca\_client double\_sign

## Description

Creates a second signature for a certificate.

 **Note:**

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

`mdsenv <IP Address or Name of Domain Management Server>`

## Syntax

```
cpca_client [-d] double_sign [-p <CA port number>] -i <Certificate File in PEM format> [-o <Full Path to Output File>]
```

## Parameters

| Parameter                           | Description                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                                  | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| -p <CA port number>                 | Optional. Specifies the TCP port on the Security Management Server or Domain Management Server, which is used to connect to the Certificate Authority.<br>The default TCP port number is 18209.                                                                                                                                            |
| -i <Certificate File in PEM format> | Imports the specified certificate (only in PEM format).                                                                                                                                                                                                                                                                                    |
| -o <Full Path to Output File>       | Optional. Saves the certificate into the specified file.                                                                                                                                                                                                                                                                                   |

## Example

```
[Expert@MGMT:0]# cpa_client double_sign -i certificate.pem

Requesting Double Signature for the following Certificate:
    refCount: 1
    Subject: Email=example@example.com,CN=http://www.example.com/,OU=ValiCert Class 2 Policy
Validation Authority,O=exampleO\, Inc.,L=ExampleL Validation Network

Double Sign of Cert:
=====
(
    : (
        :dn ("Email=example@example.com,CN=http://www.example.com/,OU=exampleOU Class 2
Policy Validation Authority,O=exampleO\, Inc.,L=exampleL Validation Network")
        :doubleSignCert (52016390... ..ebb67e96)
        :return_code (0)
    )
)

[Expert@MGMT:0]#
```

# cpca\_client get\_crl dp

## Description

Shows the Fully Qualified Domain Name (FQDN) configured for the Internal Certificate Authority (ICA) with the "[cp\\_conf ca](#)" on page 68" command.

The Management Server uses this FQDN:

1. To configure the Certificate Revocation List Distribution Point (CRL DP) property in all certificates that the ICA generates.
2. To create the URL for accessing the CRL.

Example: `http://MyMGMT.checkpoint.com:18264/ICA_CRL1.crl`

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsend <IP Address or Name of Domain Management Server>
```

## Syntax

```
cpca_client [-d] get_crl dp [-p <ICA port number>]
```

## Parameters

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                   | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| -p <ICA port number> | Optional.<br>Specifies the TCP port on the Security Management Server or Domain Management Server, which is used to connect to the Certificate Authority.<br>The default TCP port number is 18264.                                                                                                                                         |

## Example

```
[Expert@MyMGMT:0]# hostname
MyMGMT
[Expert@MyMGMT:0]#

[Expert@MyMGMT:0]# domainname
checkpoint.com
[Expert@MyMGMT:0]#

[Expert@MyMGMT:0]# cpc_a_client get_crldp
MyMGMT.checkpoint.com
[Expert@MyMGMT:0]
```

# cpca\_client get\_pubkey

## Description

Saves the encoding of the public key of the ICA's certificate to a file.

 **Note:**  
On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

mdsend <IP Address or Name of Domain Management Server>

## Syntax

```
cpca_client [-d] get_pubkey [-p <CA port number>] <Full Path to Output File>
```

## Parameters

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                               |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                         | <p>Runs the command in debug mode.</p> <p>Use only if you troubleshoot the command itself.</p> <p> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> |
| -p <CA port number>        | <p>Specifies the TCP port on the Security Management Server or Domain Management Server, which is used to connect to the Certificate Authority.</p> <p>The default TCP port number is 18209.</p>                                                                                                                                                          |
| <Full Path to Output File> | <p>Saves the encoding of the public key of the ICA's certificate to the specified file.</p>                                                                                                                                                                                                                                                               |

## Example

```
[Expert@MGMT:0]# cpcal_client get_pubkey /tmp/key.txt[Expert@MGMT:0]#
[Expert@MGMT:0]# cat /tmp/key.txt
3082010a... ..f98b8910
[Expert@MGMT:0]#
```

# cpca\_client init\_certs

## Description

Imports a list of Distinguished Names (DN) for users and creates a file with registration keys for each user.

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
cpca_client [-d] init_certs [-p <CA port number>] -i <Full Path to Input File> -o <Full Path to Output File>
```

## Parameters

| Parameter                     | Description                                                                                                                                                                                                                                                          |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                            | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> |
| -p <CA port number>           | <p>Optional. Specifies the TCP port on the Security Management Server or Domain Management Server, which is used to connect to the Certificate Authority.<br/>The default TCP port number is 18209.</p>                                                              |
| -i <Full Path to Input File>  | <p>Imports the specified file.<br/>Make sure to use the full path.<br/>Make sure that there is an empty line between each DN in the specified file.<br/>Example:</p> <pre>...CN=test1,OU=users... &amp;ltltEmpty Line&gt; ...CN=test2,OU=users...</pre>              |
| -o <Full Path to Output File> | <p>Saves the registration keys to the specified file.<br/>This command saves the error messages in the &lt;Name of Output File&gt;.failures file in the same directory.</p>                                                                                          |

# cpca\_client lscert

## Description

Shows all certificates issued by the ICA.

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
cpca_client [-d] lscert [-dn <SubString>] [-stat {Pending | Valid  
| Revoked | Expired | Renewed}] [-kind {SIC | IKE | User | LDAP}]  
[-ser <Certificate Serial Number>] [-dp <Certificate Distribution  
Point>]
```

## Parameters

| Parameter                                                          | Description                                                                                                                                                                                                                                                          |
|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-d</code>                                                    | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> |
| <code>-dn &lt;SubString&gt;</code>                                 | <p>Optional. Filters the search results to those with a DN that matches the specified <i>&lt;SubString&gt;</i>.<br/>This command does not support multiple values.</p>                                                                                               |
| <code>-stat {Pending   Valid   Revoked   Expired   Renewed}</code> | <p>Optional. Filters the search results to those with certificate status that matches the specified status.<br/>This command does not support multiple values.</p>                                                                                                   |
| <code>-kind {SIC   IKE   User   LDAP}</code>                       | <p>Optional. Filters the search results to those with certificate kind that matches the specified kind.<br/>This command does not support multiple values.</p>                                                                                                       |
| <code>-ser &lt;Certificate Serial Number&gt;</code>                | <p>Optional. Filters the search results to those with certificate serial number that matches the specified serial number.<br/>This command does not support multiple values.</p>                                                                                     |
| <code>-dp &lt;Certificate Distribution Point&gt;</code>            | <p>Optional. Filters the search results to the specified Certificate Distribution Point (CDP).<br/>This command does not support multiple values.</p>                                                                                                                |

## Example

```
[Expert@MGMT:0]# cpa_client lscert -stat Revoked
Operation succeeded. rc=0.
5 certs found.

# cpca\_client recreate\_crls

## Description

Recreates all CRLs in the Internal CA database after you manually remove expired certificates from the Internal CA database as described in [sk42424](#).

 **Note:**  
On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

mdsenv <IP Address or Name of Domain Management Server>

## Syntax

```
cpca_client [-d] recreate_crls
```

## Parameters

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d            | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| recreate_crls | Recreates all CRLs in the Internal CA database.                                                                                                                                                                                                                                                                                            |

## Example

```
[Expert@MGMT:0]# cpcal_client recreate_crls

About to ask the Internal CA to recreate all CRLs.

Recreating the Internal CA CRLs finished successfully.

[Expert@MGMT:0]#
```

# cpca\_client revoke\_cert

## Description

Revokes a certificate issued by the ICA.

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
cpca_client [-d] revoke_cert [-p <CA port number>] -n "CN=<Common Name>" -s <Certificate Serial Number>
```

## Parameters

| Parameter                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                                | <p>Runs the command in debug mode.</p> <p>Use only if you troubleshoot the command itself.</p> <p>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p>                                                                                                                                                                                                                                                                                                                                                                  |
| -p <CA port number>               | <p>Optional. | -n<br>"CN=<Common Name>"          | <p>Specifies the certificate CN.</p> <p>To get the CN, run the <a href="#">"cpca_client lscert" on page 111</a> command and examine the text that you see between the "Subject =" and the ", O=...".</p> <p><b>Example</b></p> <p>From this output:</p> <pre>Subject = CN=VS1 VPN Certificate,O=MyDomain_Server.checkpoint.com.s6t98x Status = Valid Kind = IKE Serial = 27214 DP = 1 Not_Before: Wed Apr 11 17:26:02 2018 Not_After: Tue Apr 11 17:26:02 2023</pre> <p>you get this syntax:</p> <pre>-n "CN=VS1 VPN Certificate"</pre> <p>📘 <b>Note</b> - You can use the parameter '-n' only, or together with the parameter "-s".</p> |
| -s<br><Certificate Serial Number> | <p>Specifies the certificate serial number.</p> <p>To see the serial number, run the <a href="#">"cpca_client lscert" on page 111</a> command.</p> <p>📘 <b>Note</b> - You can use the parameter "-s" only, or together with the parameter "-n".</p>                                                                                                                                                                                                                                                                                                                                                                                      |

## Example 1 - Revoking a certificate specified by its CN

```
[Expert@MGMT:0]# cpca_client lscert
Subject = CN=VS1 VPN Certificate,O=MyDomain_Server.checkpoint.com.s6t98x
Status = Valid Kind = IKE Serial = 27214 DP = 1
Not_Before: Wed Apr 11 17:26:02 2018 Not_After: Tue Apr 11 17:26:02 2023
[Expert@MGMT:0]#
[Expert@MGMT:0]# cpca_client -d revoke_cert -n "CN=VS1 VPN Certificate"
Certificate was revoked successfully
[Expert@MGMT:0]#
```

**Example 2 - Revoking a certificate specified by its serial number.**

```
[Expert@MGMT:0]# cpa_client lscert
Subject = CN=VS1 VPN Certificate,O=MyDomain_Server.checkpoint.com.s6t98x
Status = Valid Kind = IKE Serial = 27214 DP = 1
Not_Before: Wed Apr 11 17:26:02 2018 Not_After: Tue Apr 11 17:26:02 2023
[Expert@MGMT:0]#
[Expert@MGMT:0]# cpa_client -d revoke_cert -s 27214
Certificate was revoked successfully
[Expert@MGMT:0]#
```

# cpca\_client revoke\_non\_exist\_cert

## Description

Revokes a non-existent certificate issued by the ICA.

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsend <IP Address or Name of Domain Management Server>
```

## Syntax

```
cpca_client [-d] revoke_non_exist_cert -i <Full Path to Input File>
```

## Parameters

| Parameter                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                              | Runs the <code>cpca_client</code> command under debug.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| -i<br><Full Path to Input File> | <p>Specifies the file that contains the list of the certificate to revoke. You must create this file in the same format as the <a href="#">"cpca_client lscert" on page 111</a> command prints its output.</p> <p><b>Example</b></p> <pre>Subject = CN=cp_mgmt,O=MGMT.5p72vp Status = Valid    Kind = SIC    Serial = 30287    DP = 0 Not_Before: Sat Apr  7 19:40:12 2018    Not_After: Fri Apr  7 19:40:12 2023 &lt;Empty Line&gt; Subject = CN=cp_mgmt,O=MGMT.5p72vp Status = Valid    Kind = SIC    Serial = 60870    DP = 0 Not_Before: Sat Apr  7 19:40:13 2018    Not_After: Fri Apr  7 19:40:13 2023</pre> |

**Note** - This command saves the error messages in the `<Name of Input File>.failures` file.

# cpca\_client search

## Description

Searches for certificates in the ICA.

 **Note:**  
On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

mdsenv <IP Address or Name of Domain Management Server>

## Syntax

```
cpca_client [-d] search <String> [-where {dn | comment | serial | device_type | device_id | device_name}] [-kind {SIC | IKE | User | LDAP}] [-stat {Pending | Valid | Revoked | Expired | Renewed}] [-max <Maximum Number of Results>] [-showfp {y | n}]
```

## Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d        | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| <String>  | Specifies the text to search in the certificates.<br>You can enter only one text string that does not contain spaces.                                                                                                                                                                                                                      |

| Parameter                                                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-where {dn   comment   serial   device_type   device_id   device_name}</code> | <p>Optional. Specifies the certificate's field, in which to search for the string:</p> <ul style="list-style-type: none"> <li>▪ <code>dn</code> - Certificate DN</li> <li>▪ <code>comment</code> - Certificate comment</li> <li>▪ <code>serial</code> - Certificate serial number</li> <li>▪ <code>device_type</code> - Device type</li> <li>▪ <code>device_id</code> - Device ID</li> <li>▪ <code>device_name</code> - Device Name</li> </ul> <p>The default is to search in all fields.</p> |
| <code>-kind {SIC   IKE   User   LDAP}</code>                                        | <p>Optional. [Expert@MGMT:0]#
```

## cpca\_client set\_ca\_services

### Description

This command enables and disables the Certificate Authority Services Portal on the Management Server on the TCP port 18268.

From this portal, you can download the applicable Internal Certificate Authority certificates.

For trust purposes, you can install this certificate on the applicable Security Gateways, externally managed Site to Site VPN peer gateways, Remote Access VPN clients, clients that use Clientless VPN, and so on.

**Note** - In R82.10, the TCP port 18264 on the Management Server is available only for the retrieval of the CRL (Certificate Revocation List).

### Syntax

```
cpca_client set_ca_services {on | off}
```

### Parameters

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| on        | Enables the Certificate Authority Services Portal  |
| off       | Disables the Certificate Authority Services Portal |

### Procedure for a Security Management Server

#### Enabling the Certificate Authority Services Portal

1. Connect to the command line on the Security Management Server.
2. Log in to the Expert mode.
3. Enable the Certificate Authority Services Portal:

```
cpca_client set_ca_services on
```

4. With a web browser, connect to:

```
http://<IP Address of Security Management Server>:18268
```

5. Download the required certificate.
6. Install this certificate on the applicable computers.

## Disabling the Certificate Authority Services Portal

1. Connect to the command line on the Security Management Server.
2. Log in to the Expert mode.
3. Disable the Certificate Authority Services Portal:

```
cpca_client set_ca_services off
```

## Procedure for a Domain Management Server

### Enabling the Certificate Authority Services Portal

1. Connect to the command line on the Multi-Domain Server.
2. Log in to the Expert mode.
3. Go to the context of the Domain Management Server:

```
mdsensv <IP Address or Name of Domain Management Server>
```

4. Enable the Certificate Authority Services Portal:

```
cpca_client set_ca_services on
```

5. With a web browser, connect to:

```
http://<IP Address of Domain Management Server>:18268
```

6. Download the required certificate.
7. Install this certificate on the applicable computers.

### Disabling the Certificate Authority Services Portal

1. Connect to the command line on the Multi-Domain Server.
2. Log in to the Expert mode.
3. Go to the context of the Domain Management Server:

```
mdsensv <IP Address or Name of Domain Management Server>
```

4. Disable the Certificate Authority Services Portal:

```
cpca_client set_ca_services off
```

# cpca\_client set\_cert\_validity

## Description

This command configures the default certificate validity period for new certificates.

### Notes:

- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

- The new certificate validity period applies only to certificate you create after this change.

## Syntax

```
cpca_client set_cert_validity -k {SIC | IKE | USER} [-y <Number of Years>] [-d <Number of Days>] [-h <Number of Hours>] [-s <Number of Seconds>]
```

## Parameters

| Parameter              | Description                               |
|------------------------|-------------------------------------------|
| -k {SIC   IKE   USER}  | Specifies the certificate type.           |
| -y <Number of Years>   | Specifies the validity period in years.   |
| -d <Number of Days>    | Specifies the validity period in days.    |
| -h <Number of Hours>   | Specifies the validity period in hours.   |
| -s <Number of Seconds> | Specifies the validity period in seconds. |

## Example

```
[Expert@MGMT:0]# cpcal_client set_cert_validity -k IKE -y 3
cert validity period was changed successfully.
[Expert@MGMT:0]#
```

# cpca\_client set\_mgmt\_tool

## Description

Controls the ICA Management Tool.

This tool is disabled by default.

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsend <IP Address or Name of Domain Management Server>
```

See [sk102837: Best Practices - ICA Management Tool configuration](#)

## Syntax

```
cpca_client [-d] set_mgmt_tool {on | off | add | remove | clean |
print} [-p <CA port number>] [{-a <Administrator DN> | -u <User
DN> | -c <Custom User DN>}]
```

## Parameters

| Parameter | Description                                                                                                                                                                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d        | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br><b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| on        | Starts the ICA Management Tool.                                                                                                                                                                                                                        |
| off       | Stops the ICA Management Tool.                                                                                                                                                                                                                         |
| add       | Adds the specified administrator, user, or custom user that is permitted to use the ICA Management Tool.                                                                                                                                               |
| remove    | Removes the specified administrator, user, or custom user that is permitted to use the ICA Management Tool.                                                                                                                                            |
| clean     | Removes all administrators, users, or custom users that are permitted to use the ICA Management Tool.                                                                                                                                                  |
| print     | Shows the configured administrators, users, or custom users that are permitted to use the ICA Management Tool.                                                                                                                                         |

| Parameter                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-p &lt;CA port number&gt;</code>   | <p>Optional. Specifies the TCP port on the Security Management Server or Domain Management Server, which is used to connect to the Certificate Authority.</p> <p>The default TCP port number is 18265.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-c &lt;Custom User DN&gt;</code> | <p>Optional. Specifies the DN for the custom user that is permitted to use the ICA Management Tool.</p> <p>Must specify the full DN as appears in SmartConsole.</p> <p><b>Procedure</b></p> <ol style="list-style-type: none"> <li>1. Open <b>Object Explorer &gt; Users</b></li> <li>2. Open the Administrator object or a User object properties</li> <li>3. Click the <b>Certificates</b> pane</li> <li>4. Select the certificate and click the pencil icon</li> <li>5. Click <b>View certificate details</b></li> <li>6. In the <b>Certificate Info</b> window, click the <b>Details</b> tab</li> <li>7. Click the <b>Subject</b> field</li> <li>8. Concatenate all fields</li> </ol> <p><b>Example:</b></p> <pre>-c "CN=ICA_Tool_User,OU=users,O=MGMT.s6t98x"</pre> |

**Note** - If you run the "cpca\_client set\_mgmt\_tool" command without the parameter "-a" or "-u", the list of the permitted administrators and users is not changed. The previously defined permitted administrators and users can start and stop the ICA Management Tool.

## To connect to the ICA Management Tool

1. In SmartConsole, configure the required administrator and user objects.

You must create a certificate for these administrators and users.

You use this certificate to configure the permitted users in the ICA Management Tool and in the client web browsers.

2. In the command line on the Management Server, add the required administrators and users that are permitted to use the ICA Management Tool.

```
cpca_client set_mgmt_tool add ...
```

3. In the command line on the Management Server, start the ICA Management Tool.

```
cpca_client set_mgmt_tool on
```

4. Check the status of the ICA Management Tool:

```
cpca_client set_mgmt_tool print
```

5. Import the administrator's / user's certificate into the Windows Certificate Store:.

- a. Right-click the \*.p12 file you saved when you created the required administrator / user, and click **Install PFX**.

The **Certificate Import Wizard** opens.

- b. In the **Store Location** section, select the applicable option:

- **Current User** (this is the default)
- **Local Machine**

- c. Click **Next**.

- d. Enter the same certificate password you used when you created the required administrator / user certificate.

- e. Clear **Enable strong private key protection**.

- f. Select **Mark this key as exportable**.

- g. Click **Next**.

- h. Select **Place all certificates in the following store** > click **Browse** > select **Personal** > click **OK**.

- i. Click **Next**.

- j. Click **Finish**.

6. In a web browser, connect to the ICA Management Tool:

```
https://<IP Address of the Management Server>:18265
```

 **Important** - The fact that the TCP port 18265 is open is not a vulnerability. The ICA Management Tool Portal is secured and protected by SSL. In addition, only authorized administrators and users are allowed to access it using a certificate.

7. A dialog box with this message appears:

```
Client Authentication
```

```
Identification
```

```
The Web site you want to view requests identification.
```

```
Select the certificate to use when connecting.
```

8. Select the appropriate certificate for authenticating to the ICA Management Tool.
9. Click **OK**.
10. In the **Security Alert** dialog box, click **Yes**.

# cpca\_client set\_sign\_hash

## Description

Sets the hash algorithm that the CA uses to sign the file hash. Also, see [sk103840](#).

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
cpca_client [-d] set_sign_hash {sha1 | sha256 | sha384 | sha512}
```

**Important** - After this change, you must restart the Check Point services with these commands:

- On Security Management Server, run:
  1. cpstop
  2. cpstart
- On a Multi-Domain Server, run:
  1. mdsstop\_customer <Name or IP Address of Domain Management Server>
  2. mdsstart\_customer <Name or IP Address of Domain Management Server>

## Parameters

| Parameter                         | Description                                                                                                                                                                                                                                              |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                                | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| {sha1   sha256   sha384   sha512} | The hash algorithms that the CA uses to sign the file hash.<br>The default algorithm is SHA-256.                                                                                                                                                         |

## Example

```
[Expert@MGMT:0]# cpa_client set_sign_hash sha256

You have selected the signature hash function SHA-256
WARNING: This hash algorithm is not supported in Check Point gateways prior to R71.
WARNING: It is also not supported on older clients and SG80 R71.

Are you sure? (y/n)
y
Internal CA signature hash changed successfully.
Note that the signature on the Internal CA certificate has not changed, but this has no security
implications.
[Expert@MGMT:0]#
[Expert@MGMT:0]# cpstop ; cpstart
```

# cpca\_create

## Description

Creates new Check Point Internal Certificate Authority database.

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
cpca_create [-d] -dn <CA DN>
```

## Parameters

| Parameter   | Description                                                                                                                                                                                                                                                          |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d          | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> |
| -dn <CA DN> | Specifies the Certificate Authority Distinguished Name (DN).                                                                                                                                                                                                         |

# cplic

## Description

The `cplic` command manages Check Point licenses.

You can run this command in Gaia Clish or in the Expert mode.

License Management is divided into three types of commands:

| Licensing Commands          | Applies To                                                | Description                                                                                                                                                            |
|-----------------------------|-----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Local licensing commands    | Management Servers, Security Gateways and Cluster Members | You execute these commands locally on the Check Point servers.                                                                                                         |
| Remote licensing commands   | Management Servers only                                   | You execute these commands on the Security Management Server or Domain Management Server.<br>These changes affect the managed Security Gateways and Cluster Members.   |
| License Repository commands | Management Servers only                                   | You execute these commands on the Security Management Server or Domain Management Server.<br>These changes affect the licenses stored in the local license repository. |

For more about managing licenses, see the [R82.10 Security Management Administration Guide](#).

## Syntax for Local Licensing on a Management Server itself

```
cplic [-d]
      {-h | -help}
      check <options>
      contract <options>
      del <options>
      print <options>
      put <options>
```

## Syntax for Remote Licensing on managed Security Gateways and Cluster Members

```
cplic [-d]
      {-h | -help}
      del <options>
      get <options>
      put <options>
      upgrade <options>
```

## Syntax for License Database Operations on a Management Server

```
cplic [-d]
      {-h | -help}
      db_add <options>
      db_print <options>
      db_rm <options>
```

### Parameters

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                    | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| {-h   -help}          | Shows the applicable built-in usage.                                                                                                                                                                                                                                                                                                       |
| check<br><options>    | Confirms that the license includes the feature on the local Security Gateway or Management Server.<br>See <a href="#">"cplic check" on page 139</a> .                                                                                                                                                                                      |
| contract<br><options> | Manages (deletes and installs) the Check Point Service Contract on the local Check Point server.<br>See <a href="#">"cplic contract" on page 141</a> .                                                                                                                                                                                     |
| db_add<br><options>   | Applies only to a Management Server.<br>Adds licenses to the license repository on the Management Server.<br>See <a href="#">"cplic db_add" on page 143</a> .                                                                                                                                                                              |

| Parameter                      | Description                                                                                                                                                                                                              |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| db_print<br><options>          | Applies only to a Management Server.<br>Shows the details of Check Point licenses stored in the license repository on the Management Server.<br>See <a href="#">"cplic db_print" on page 145</a> .                       |
| db_rm<br><options>             | Applies only to a Management Server.<br>Removes a license from the license repository on the Management Server.<br>See <a href="#">"cplic db_rm" on page 147</a> .                                                       |
| del <options>                  | Deletes a Check Point license on a host, including unwanted evaluation, expired, and other licenses.<br>See <a href="#">"cplic del" on page 148</a> .                                                                    |
| del <Object Name><br><options> | Detaches a Central license from a remote managed Security Gateway or Cluster Member.<br>See <a href="#">"cplic del &lt;object name&gt;" on page 149</a> .                                                                |
| get <options>                  | Applies only to a Management Server.<br>Retrieves all licenses from managed Security Gateways and Cluster Members into the license repository on the Management Server.<br>See <a href="#">"cplic get" on page 150</a> . |
| print<br><options>             | Prints details of the installed Check Point licenses on the local Check Point server.<br>See <a href="#">"cplic print" on page 152</a> .                                                                                 |
| put <options>                  | Installs and attaches licenses on a Check Point server.<br>See <a href="#">"cplic put" on page 155</a> .                                                                                                                 |
| put <Object Name><br><options> | Attaches one or more Central or Local licenses to a remote managed Security Gateways and Cluster Members.<br>See <a href="#">"cplic put &lt;object name&gt;" on page 158</a> .                                           |
| upgrade<br><options>           | Applies only to a Management Server.<br>Upgrades licenses in the license repository with licenses in the specified license file.<br>See <a href="#">"cplic upgrade" on page 161</a> .                                    |

# cplic check

## Description

Confirms that the license includes the feature on the local Security Gateway or Management Server. See [sk66245](#).

## Syntax

```
cplic check {-h | -help}
```

```
cplic [-d] check [-p <Product>] [-v <Version>] [{-c | -count}] [-t  
<Date>] [{-r | -routers}] [{-S | -SRusers}] <Feature>
```

You can run this command:

- On a Management Server / Security Gateway / Cluster Member in Gaia Clish or the Expert mode
- On a Scalable Platform Security Group in Gaia gClish or the Expert mode

## Parameters

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {-h   -help}    | Shows the applicable built-in usage.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| -d              | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.                                                                                                                                                                                                   |
| -p<br><Product> | Product, for which license information is requested.<br>Some examples of products: <ul style="list-style-type: none"> <li>■ fw1 - FireWall-1 infrastructure on Security Gateway / Cluster Member / Security Group (all Software Blades), or Management Server (all Software Blades)</li> <li>■ mgmt - Multi-Domain Server infrastructure</li> <li>■ services - Entitlement for various services</li> <li>■ cvpn - Mobile Access</li> <li>■ etm - QoS (FloodGate-1)</li> <li>■ eps - Endpoint Software Blades on Management Server</li> </ul> |
| -v<br><Version> | Product version, for which license information is requested.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Parameter                    | Description                                                                                                                                                 |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>{-c   -count}</code>   | Outputs the number of licenses connected to this feature.                                                                                                   |
| <code>-t &lt;Date&gt;</code> | Checks license status on future date.<br>Use the format <b>ddmmyyyy</b> .<br>A feature can be valid on a given date on one license, but invalid on another. |
| <code>{-r   -routers}</code> | Checks how many routers are allowed.<br>The <code>&lt;Feature&gt;</code> option is not needed.                                                              |
| <code>{-S   -SRusers}</code> | Checks how many SecuRemote users are allowed.                                                                                                               |
| <code>&lt;Feature&gt;</code> | Feature, for which license information is requested.                                                                                                        |

## Example from a Management Server

```
[Expert@MGMT]# cplic print -p
Host Expiration Primitive-Features

[Expert@GW]#
```

# cplic contract

## Description

Deletes the Check Point Service Contract on the local Check Point server.

Installs the Check Point Service Contract on the local Check Point server.

### Note

- For more information about Service Contract files, see [sk33089: What is a Service Contract File?](#)
- If you install a Service Contract on a managed Security Gateway / Cluster Member / Scalable Platform Security Group, you must update the license repository on the applicable Management Server - either with the "*cplic get*" on [page 150](#) command, or in SmartUpdate.

## Syntax

```
cplic contract -h

cplic [-d] contract
      del
          -h
          <Service Contract ID>

      put
          -h
          [{-o | -overwrite}] <Service Contract File>
```

You can run this command:

- On a Management Server / Security Gateway / Cluster Member in Gaia Clish or the Expert mode
- On a Scalable Platform Security Group in Gaia gClish or the Expert mode

## Parameters

| Parameter                                  | Description                                                                                                                                                                                                                                                          |
|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>{-h   -help}</code>                  | Shows the applicable built-in usage.                                                                                                                                                                                                                                 |
| <code>-d</code>                            | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> |
| <code>del</code>                           | Deletes the Service Contract from the <code>\$CPDIR/conf/cp.contract</code> file on the local Check Point server.                                                                                                                                                    |
| <code>put</code>                           | Merges the Service Contract to the <code>\$CPDIR/conf/cp.contract</code> file on the local Check Point server.                                                                                                                                                       |
| <code>&lt;Service Contract ID&gt;</code>   | ID of the Service Contract.                                                                                                                                                                                                                                          |
| <code>{-o   -overwrite}</code>             | Specifies to overwrite the current Service Contract.                                                                                                                                                                                                                 |
| <code>&lt;Service Contract File&gt;</code> | <p>Path to and the name of the Service Contract file.<br/>First, you must download the Service Contract file from your <a href="#">Check Point User Center</a> account.</p>                                                                                          |

# cplic db\_add

## Description

Adds licenses to the license repository on the Management Server.

When you add Local licenses to the license repository, Management Server automatically attaches them to the managed Security Gateway / Cluster Member with the matching IP address.

When you add Central licenses, you must manually attach them.

**Note** - You get the license details in the [Check Point User Center](#).

## Syntax

```
cplic db_add {-h | -help}
```

```
cplic [-d] db_add -l <License File> [<Host>] [<Expiration Date>]  
[<Signature>] [<SKU/Features>]
```

## Parameters

| Parameter         | Description                                                                                                                                                                                                                                            |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {-h   -help}      | Shows the applicable built-in usage.                                                                                                                                                                                                                   |
| -d                | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br><b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| -l <License File> | Name of the file that contains the license.                                                                                                                                                                                                            |
| <Host>            | Hostname or IP address of the Security Management Server / Domain Management Server.                                                                                                                                                                   |
| <Expiration Date> | The license expiration date.                                                                                                                                                                                                                           |
| <Signature>       | The license signature string.<br>For example: aa6uwknDc-CE6CRtjhv-zipoVWSnm-z98N7Ck3m<br>Case sensitive. Hyphens are optional.                                                                                                                         |

| Parameter                         | Description                                                                                                   |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>&lt;SKU/Features&gt;</code> | The SKU of the license summarizes the features included in the license.<br>For example, CPSUITE-EVAL-3DES-vNG |

## Example

If the file `192.0.2.11.lic` contains one or more licenses, the command "`cplic db_add -l 192.0.2.11.lic`" produces output similar to:

```
[Expert@MGMT]# cplic db_add -l 192.0.2.11.lic
Adding license to database ...
Operation Done
[Expert@MGMT]#
```

# cplic db\_print

## Description

Shows the details of Check Point licenses stored in the license repository on the Management Server.

## Syntax

```
cplic db_print {-h | -help}
```

```
cplic [-d] db_print {<Object Name> | -all} [{-n | -noheader}] [-x]
[{-t | -type}] [{-a | -attached}]
```

## Parameters

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {-h   -help}     | Shows the applicable built-in usage.                                                                                                                                                                                                                                                                                                       |
| -d               | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| <Object Name>    | Prints only the licenses attached to <Object Name>.<br><Object Name> is the name of the Security Gateway / Cluster Member object as defined in SmartConsole.                                                                                                                                                                               |
| -all             | Prints all the licenses in the license repository.                                                                                                                                                                                                                                                                                         |
| {-n   -noheader} | Prints licenses with no header.                                                                                                                                                                                                                                                                                                            |
| -x               | Prints licenses with their signatures.                                                                                                                                                                                                                                                                                                     |
| {-t   -type}     | Prints licenses with their type: Central or Local.                                                                                                                                                                                                                                                                                         |
| {-a   -attached} | Shows to which object the license is attached.<br>Useful, if the parameter "-all" is specified.                                                                                                                                                                                                                                            |

## Example

```
[Expert@MGMT:0]# cplic db_print -all
Retrieving license information from database ...

The following licenses appear in the database:
=====
Host          Expiration Features
192.168.3.28   25Aug2019  xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx CPMP-XXX  CK-XXXXXXXXXXXXX
[Expert@MGMT:0]#

[Expert@MGMT:0]# cplic db_print -all -x -a
Retrieving license information from database ...

The following licenses appear in the database:
=====
Host          Expiration Features
192.168.3.28   25Aug2019  xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx CPMP-XXX  CK-XXXXXXXXXXXXX  MGMT
[Expert@MGMT:0]#
```

# cplic db\_rm

## Description

Removes a license from the license repository on the Management Server.

After you remove the license from the repository, it can no longer use it.

 **Warning** - You can run this command **ONLY** after you detach the license with the *"cplic del" on page 148* command.

## Syntax

```
cplic db_rm {-h | -help}
```

```
cplic [-d] db_rm <Signature>
```

## Parameters

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {-h   -help} | Shows the applicable built-in usage.                                                                                                                                                                                                                                                                                                       |
| -d           | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| <Signature>  | The signature string within the license.<br>To see the license signature string, run the <i>"cplic print" on page 152</i> command.                                                                                                                                                                                                         |

## Example

```
[Expert@MGMT:0]# cplic db_rm 2f540abb-d3bcb001-7e54513e-kfyigpwn
```

# cplic del

## Description

Deletes a Check Point license on a host, including unwanted evaluation, expired, and other licenses.

This command can delete a license on both local server, and on remote managed servers.

## Syntax

```
cplic del {-h | -help}
```

```
cplic [-d] del [-F <Output File>] <Signature> <Object Name>
```

You can run this command:

- On a Management Server / Security Gateway / Cluster Member in Gaia Clish or the Expert mode
- On a Scalable Platform Security Group in Gaia gClish or the Expert mode

## Parameters

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {-h   -help}     | Shows the applicable built-in usage.                                                                                                                                                                                                                                                                                                       |
| -d               | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| -F <Output File> | Saves the command output to the specified file.                                                                                                                                                                                                                                                                                            |
| <Signature>      | The signature string within the license.<br>To see the license signature string, run the <a href="#">"cplic print" on page 152</a> command.                                                                                                                                                                                                |
| <Object Name>    | The name of the Security Gateway / Cluster Member object as configured in SmartConsole.                                                                                                                                                                                                                                                    |

## cplic del <object name>

### Description

Detaches a Central license from a remote managed Security Gateway or Cluster Member.

When you run this command, it automatically updates the license repository.

The Central license remains in the license repository as an unattached license.

### Syntax

```
cplic del {-h | -help}
```

```
cplic [-d] del <Object Name> [-F <Output File>] [-ip <Dynamic IP Address>] <Signature>
```

### Parameters

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {-h   -help}             | Shows the applicable built-in usage.                                                                                                                                                                                                                                                                                                       |
| -d                       | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| <Object Name>            | The name of the Security Gateway / Cluster Member object as defined in SmartConsole.                                                                                                                                                                                                                                                       |
| -F <Output File>         | Saves the command output to the specified file.                                                                                                                                                                                                                                                                                            |
| -ip <Dynamic IP Address> | Deletes the license on the DAIP Security Gateway with the specified IP address.<br><b>Note</b> - If this parameter is used, then object name must be a DAIP Security Gateway.                                                                                                                                                              |
| <Signature>              | The signature string within the license.<br>To see the license signature string, run the <a href="#">"cplic print" on page 152</a> command.                                                                                                                                                                                                |

# cplic get

## Description

Retrieves all licenses from managed Security Gateways and Cluster Members into the license repository on the Management Server.

This command helps synchronize the license repository with the managed Security Gateways and Cluster Members.

When you run this command, it updates the license repository with all local changes.

## Syntax

```
cplic get {-h | -help}
```

```
cplic [-d] get  
      -all  
      <IP Address>  
      <Host Name>
```

## Parameters

| Parameter    | Description                                                                                                                                                                                                                                                          |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {-h   -help} | Shows the applicable built-in usage.                                                                                                                                                                                                                                 |
| -d           | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> |
| -all         | Retrieves licenses from all Security Gateways and Cluster Members in the managed network.                                                                                                                                                                            |
| <IP Address> | The IP address of the Security Gateway / Cluster Member, from which licenses are to be retrieved.                                                                                                                                                                    |
| <Host Name>  | The name of the Security Gateway / Cluster Member object as defined in SmartConsole, from which licenses are to be retrieved.                                                                                                                                        |

## Example

If the Security Gateway with the object name `MyGW` contains four Local licenses, and the license repository contains two other Local licenses, the command `"cplic get MyGW"` produces output similar to this:

```
[Expert@MGMT:0]# cplic get MyGW
Get retrieved 4 licenses.
Get removed 2 licenses.
[Expert@MGMT:0]#
```

# cplic print

## Description

Prints details of the installed Check Point licenses on the local Check Point server.

### Notes:

- On a Security Gateway / Cluster Member / Scalable Platform Security Group, this command prints all installed licenses (both Local and Central).
- Before installing a valid license, and after you establish SIC between this Security Gateway / Cluster Member and its Management Server, this command shows the trial license.

## Syntax

```
cplic print {-h | -help}
```

```
cplic [-d] print[{-n | -noheader}] [-x] [{-t | -type}] [-F <Output File>] [{-p | -preatures}] [-D]
```

You can run this command:

- On a Management Server / Security Gateway / Cluster Member in Gaia Clish or the Expert mode
- On a Scalable Platform Security Group in Gaia gClish or the Expert mode

## Parameters

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {-h   -help}     | Shows the applicable built-in usage.                                                                                                                                                                                                                                                                                                       |
| -d               | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| {-n   -noheader} | Prints licenses without the output header.                                                                                                                                                                                                                                                                                                 |
| -x               | Prints licenses and their signature.                                                                                                                                                                                                                                                                                                       |
| {-t   -type}     | Prints licenses and their type: Central or Local.                                                                                                                                                                                                                                                                                          |
| -F <Output File> | Saves the command output to the specified file.                                                                                                                                                                                                                                                                                            |

| Parameter         | Description                                                                                                                                                                                                                            |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {-p   -preatures} | Prints licenses and their primitive features.<br> <b>Best Practice</b> - Use this syntax: <div> cplic print -n -p   tr ' ' '\n'  <br/> sort -u </div> |
| -D                | On a Multi-Domain Server, prints only Domain licenses.                                                                                                                                                                                 |

### Example 1

```
[Expert@HostName:0]# cplic print
Host      Expiration  Features
192.168.3.28  25Aug2019  CPMP-XXX  CK-XXXXXXXXXXXXX
[Expert@HostName:0]#
```

### Example 2

```
[Expert@HostName:0]# cplic print -n
192.168.3.28  25Aug2019  CPMP-XXX  CK-XXXXXXXXXXXXX
[Expert@HostName:0]#
```

### Example 3

```
[Expert@HostName:0]# cplic print -x
Host      Expiration  Signature                                     Features
192.168.3.28  25Aug2019  xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx  CPMP-XXX  CK-XXXXXXXXXXXXX
[Expert@HostName:0]#
```

### Example 4

```
[Expert@HostName:0]# cplic print -t
Type      Host      Expiration  Features
central   192.168.3.28  25Aug2019  CPMP-XXX  CK-XXXXXXXXXXXXX
[Expert@HostName:0]#
```

## Example 5

```
[Expert@HostName:0]# cplic print -t
Host      Expiration  Features
192.168.3.28  25Aug2019    CPMP-XXX  CK-XXXXXXXXXXXX fw1:6.0:swb fw1:6.0:zp fw1:6.0:ctnt ...
[Expert@HostName:0]#

[Expert@HostName:0]# cplic print -n -p | tr ' ' '\n' | sort -u

25Aug2019
192.168.3.28
::CK-XXXXXXXXXXXX

```

# cplic put

## Description

Installs one or more Local licenses on a Check Point server.

**Note** - You get the license details in the [Check Point User Center](#).

## Syntax

```
cplic put {-h | -help}
```

```
cplic [-d] put [{-o | -overwrite}] [{-c | -check-only}] [{-s | -select}] [-F <Output File>] [{-P | -Pre-boot}] [{-k | -kernel-only}] -l <License File> [<Host>] [<Expiration Date>] [<Signature>] [<SKU/Features>]
```

You can run this command:

- On a Management Server / Security Gateway / Cluster Member in Gaia Clish or the Expert mode
- On a Scalable Platform Security Group in Gaia gClish or the Expert mode

## Parameters

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {-h   -help}       | Shows the applicable built-in usage.                                                                                                                                                                                                                                                                                                       |
| -d                 | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| {-o   -overwrite}  | On a Security Gateway / Cluster Member / Scalable Platform Security Group, this command erases only the local licenses, but not central licenses that are installed remotely.                                                                                                                                                              |
| {-c   -check-only} | Verifies the license. Checks if the IP of the license matches the Check Point server and if the signature is valid.                                                                                                                                                                                                                        |
| {-s   -select}     | Selects only the local license whose IP address matches the IP address of the Check Point server.                                                                                                                                                                                                                                          |

| Parameter                            | Description                                                                                                                                                                                                                           |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-F &lt;Output File&gt;</code>  | Saves the command output to the specified file.                                                                                                                                                                                       |
| <code>{-P   -Pre-boot}</code>        | Use this option after you have upgraded and before you reboot the Check Point server.<br>Use of this option will prevent certain error messages.                                                                                      |
| <code>{-K   -kernel-only}</code>     | Pushes the current valid licenses to the kernel.<br>For use by Check Point Support only.                                                                                                                                              |
| <code>-l &lt;License File&gt;</code> | Name of the file that contains the license.                                                                                                                                                                                           |
| <code>&lt;Host&gt;</code>            | Hostname or IP address of the Security Gateway / Cluster Member / Scalable Platform Security Group for a local license.<br>Hostname or IP address of the Security Management Server / Domain Management Server for a central license. |
| <code>&lt;Expiration Date&gt;</code> | The license expiration date.                                                                                                                                                                                                          |
| <code>&lt;Signature&gt;</code>       | The signature string within the license.<br>Case sensitive. The hyphens are optional.                                                                                                                                                 |
| <code>&lt;SKU/Features&gt;</code>    | The SKU of the license summarizes the features included in the license.<br>For example: CPSUITE-EVAL-3DES-vNG                                                                                                                         |

Copy and paste the parameters from the license received from the User Center:

| Parameter       | Description                                                                                                                                                                                     |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| host            | The IPv4 address of the external interface (in quad-dot notation).                                                                                                                              |
| expiration date | The license expiration date. It can be <code>never</code> .                                                                                                                                     |
| signature       | The license signature string.<br>Case sensitive. The hyphens are optional.                                                                                                                      |
| SKU/features    | A string listing the SKU and the Certificate Key of the license.<br>The SKU of the license summarizes the features included in the license.<br>For example: CPSB-SWB CPSB-ADNC-M CK0123456789ab |

## Example

```
[Expert@HostName:0]# cplic put -l License.lic
Host Expiration SKU
192.168.2.3 14Jan2016  CPSB-SWB  CPSB-ADNC-M  CK0123456789ab
[Expert@HostName:0]#
```

# cplic put <object name>

## Description

Attaches one or more Central or Local licenses to a remote managed Security Gateways and Cluster Members.

When you run this command, it automatically updates the license repository.

## Note

- You get the license details in the [Check Point User Center](#).
- You can attach more than one license.

## Syntax

```
cplic put {-h | -help}
```

```
cplic [-d] put <Object Name> [-ip<Dynamic IP Address> ] [-F  
<Output File>] -l <License File> [<Host>] [<Expiration Date>]  
[<Signature>] [<SKU/Feature>]
```

## Parameters

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {-h   -help}             | Shows the applicable built-in usage.                                                                                                                                                                                                                                                                                                                                                                  |
| -d                       | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p>                                                  |
| <Object Name>            | The name of the Security Gateway / Cluster Member object, as defined in SmartConsole.                                                                                                                                                                                                                                                                                                                 |
| -ip <Dynamic IP Address> | <p>Installs the license on the Security Gateway with the specified IP address.<br/>This parameter is used to install a license on a Security Gateway with dynamically assigned IP address (DAIP).</p> <p> <b>Note</b> - If you use this parameter, then the object name must be that of a DAIP Security Gateway.</p> |
| -F <Output File>         | Saves the command output to the specified file.                                                                                                                                                                                                                                                                                                                                                       |
| -l <License File>        | Installs the licenses from the <License file>.                                                                                                                                                                                                                                                                                                                                                        |
| <Host>                   | Hostname or IP address of the Security Management Server / Domain Management Server.                                                                                                                                                                                                                                                                                                                  |
| <Expiration Date>        | The license expiration date.                                                                                                                                                                                                                                                                                                                                                                          |
| <Signature>              | <p>The license signature string.<br/>Case sensitive. The hyphens are optional.</p>                                                                                                                                                                                                                                                                                                                    |
| <SKU/Features>           | <p>The SKU of the license summarizes the features included in the license.<br/>For example: CPSUITE-EVAL-3DES-vNG</p>                                                                                                                                                                                                                                                                                 |

Copy and paste the parameters from the license received from the User Center:

| Parameter          | Description                                                                                                                                                                                     |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| host               | The IP address of the external interface (in quad-dot notation).<br>The last part cannot be 0 or 255.                                                                                           |
| expiration<br>date | The license expiration date. It can be <code>never</code> .                                                                                                                                     |
| signature          | The license signature string.<br>Case sensitive. The hyphens are optional.                                                                                                                      |
| SKU/features       | A string listing the SKU and the Certificate Key of the license.<br>The SKU of the license summarizes the features included in the license.<br>For example: CPSB-SWB CPSB-ADNC-M CK0123456789ab |

# cplic upgrade

## Description

Upgrades licenses in the license repository with licenses in the specified license file.

**Note** - You get this license file in the [Check Point User Center](#).

## Syntax

```
cplic upgrade {-h | -help}

cplic [-d] upgrade -l <Input File>
```

## Parameters

| Parameter       | Description                                                                                                                                      |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| {-h   -help}    | Shows the applicable built-in usage.                                                                                                             |
| -l <Input File> | Upgrades the licenses in the license repository and Check Point Security Gateways / Cluster Members to match the licenses in the specified file. |

## Example

This example explains the procedure to upgrade the licenses in the license repository.

There are two Software Blade licenses in the input file:

- One license does not match any license on a remote managed Security Gateway.
- The other license matches an NGX-version license on a managed Security Gateway that has to be upgraded.

Workflow in this example:

1. Upgrade the Security Management Server to the latest version.  
Ensure that there is connectivity between the Security Management Server and the Security Gateways with the previous product versions.
2. Import all licenses into the license repository.  
You can also do this after you upgrade the products on the remote Security Gateways.
3. Run this command:

```
cplic get -all
```

**Example:**

```
[Expert@MyMGMT]# cplic get -all
Getting licenses from all modules ...
MyGW:
Retrieved 1 licenses
```

4. To see all the licenses in the repository, run this command:

```
cplic db_print -all -a
```

**Example:**

```
[Expert@MyMGMT]# cplic db_print -all -a
Retrieving license information from database ...

The following licenses appear in the database:
=====
Host Expiration Features
192.0.2.11 Never CPEW-FIG-25-53 CK49C3A3CC7121 MyGW1
192.0.2.11 26Nov2017 CPSB-SWB CPSB-ADNC-M CK0123456789ab MyGW2
```

5. In the [Check Point User Center](#), view the licenses for the products that were upgraded from version NGX to a Software Blades license.

You can also create new upgraded licenses.

6. Download a file containing the upgraded licenses.

Only download licenses for the products that were upgraded from version NGX to Software Blades.

7. If you did not import the version NGX licenses into the repository, import the version NGX licenses now.

Use this command:

```
cplic get -all
```

8. Run the license upgrade command:

```
cplic upgrade -l <Input File>
```

- The licenses in the downloaded license file and in the license repository are compared.
- If the certificate keys and features match, the old licenses in the repository and in the remote Security Gateways are updated with the new licenses.
- A report of the results of the license upgrade is printed.

For more about managing licenses, see the [\*R82.10 Security Management Administration Guide\*](#).

# cpmiquerybin

## Description

The `cpmiquerybin` utility connects to a specified database, runs a user-defined query and shows the query results.

The results can be a collection of Security Gateway sets or a tab-delimited list of specified fields from each retrieved object.

The default database of the query tool is based on the shell environment settings.

To connect to a Domain Management Server database, run ["mdserv" on page 766](#) and define the necessary environment variables.

Use the Domain Management Server name or IP address as the first parameter.

### Notes:

- You can see complete documentation of the `cpmiquerybin` utility, with the full query syntax, examples, and a list of common attributes in [sk65181](#).
- The `MISSING_ATTR` string shows when you use an attribute name that does not exist in the objects in query result.

## Syntax

```
cpmiquerybin <query_result_type> <database> <table> <query> [-a  
<attributes_list>]
```

## Parameters

| Parameter                                               | Description                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;query_result_type&gt;</code>                  | <p>Query result in one of these formats:</p> <ul style="list-style-type: none"> <li>▪ <code>attr</code> - Returns values from one or more specified fields for each object. Use the <code>-a</code> parameter followed by a comma separated list of fields.</li> <li>▪ <code>object</code> - Shows Security Gateway sets containing data of each retrieved object.</li> </ul> |
| <code>&lt;database&gt;</code>                           | <p>Name of the database file in quotes. For example, "mdsdb".<br/>Use empty double quotes "" to run the query on the default database.</p>                                                                                                                                                                                                                                    |
| <code>&lt;table&gt;</code>                              | <p>Name of the database table that contains the data.</p>                                                                                                                                                                                                                                                                                                                     |
| <code>&lt;query&gt;</code>                              | <p>One or more query strings in a comma separated list.<br/>Use empty double quotes ( "") to return all objects in the database table.<br/>You can use the asterisk character (*) as a wildcard replacement for one or more matching characters in your query string.</p>                                                                                                     |
| <code>-a</code><br><code>&lt;attributes_list&gt;</code> | <p>If you use the "query_result_type" parameter, you must specify one or more attributes in a comma-delimited list (without spaces) of object fields.<br/>You can return all object names with the special string: <code>__name__</code></p>                                                                                                                                  |

## Return Values

- **0** - Query returns data successfully
- **1** - Query does not return data or there is a query syntax error

## Example - Viewing the names of the currently defined network objects

```
[Expert@HostName:0]# cpmiquerybin attr "" network_objects "" -a __name__
DMZZone
WirelessZone
ExternalZone
InternalZone
AuxiliaryNet
LocalMachine_All_Interfaces
CPDShield
InternalNet
LocalMachine
DMZNet
[Expert@HostName:0]#
```

# cppkg

## Description

Manages the SmartUpdate software packages repository on the Security Management Server.

 **Important** - Installing software packages with the SmartUpdate is not supported for Security Gateways running on Gaia OS.

## Syntax

```
cppkg
    add <options>
    {del | delete} <options>
    get
    getroot
    print
    setroot <options>
```

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the MDS (run `mdsenv`).

## Parameters

| Parameter                                   | Description                                                                                                                                                                 |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>add &lt;options&gt;</code>            | Adds a SmartUpdate software package to the repository.<br>See <a href="#">"cppkg add" on page 173</a> .                                                                     |
| <code>{del   delete} &lt;options&gt;</code> | Deletes a SmartUpdate software package from the repository.<br>See <a href="#">"cppkg delete" on page 174</a> .                                                             |
| <code>get</code>                            | Updates the list of the SmartUpdate software packages in the repository.<br>See <a href="#">"cppkg get" on page 176</a> .                                                   |
| <code>getroot</code>                        | Shows the path to the root directory of the repository (the value of the environment variable <code>\$SUROOT</code> ).<br>See <a href="#">"cppkg getroot" on page 177</a> . |
| <code>print</code>                          | Prints the list of SmartUpdate software packages in the repository.<br>See <a href="#">"cppkg print" on page 178</a> .                                                      |
| <code>setroot &lt;options&gt;</code>        | Configures the path to the root directory of the repository.<br>See <a href="#">"cppkg setroot" on page 179</a> .                                                           |

# cppkg add

## Description

Adds a SmartUpdate software package to the SmartUpdate software packages repository.

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the MDS (run the `mdsenv` command).
- This command does not overwrite existing packages. To overwrite an existing package, you must first delete the existing package.
- You get the SmartUpdate software packages from the [Check Point Support Center](#).

## Syntax

```
cppkg add <Full Path to Package | DVD Drive [Product]>
```

## Parameters

| Parameter                           | Description                                                                        |
|-------------------------------------|------------------------------------------------------------------------------------|
| <i>&lt;Full Path to Package&gt;</i> | Specifies the full local path on the computer to the SmartUpdate software package. |
| <i>DVD Drive [Product]</i>          | Specifies the DVD root path.<br>Example: <code>/mnt/CPR80</code>                   |

## Example - Adding R77.20 HFA\_75 (R77.20.75) firmware package for 1100 Appliances

```
[Expert@MGMT:0]# cppkg print
Vendor          Product          Version    OS          Minor Version
-----
[Expert@MGMT:0]#

[Expert@MGMT:0]# cppkg add /var/log/CP1100_6.0_4_0_-.tgz
Adding package to the repository
Getting the package type...
Extracting the package files...
Copying package to the repository...
Package was successfully added to the repository
[Expert@MGMT:0]#

[Expert@MGMT:0]# cppkg print
Vendor          Product          Version    OS          Minor Version
-----
Check Point     CP1100           R77.20Gaia Embedded  R77.20
[Expert@MGMT:0]#
```

# ppkg delete

## Description

Deletes SmartUpdate software packages from the SmartUpdate software packages repository.

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the MDS (run the `mdsenv` command).

## Syntax

```
cppkg del ["<Vendor>" "<Product>" "<Major Version>" "<OS>" "<Minor Version>"]
```

```
cppkg delete ["<Vendor>" "<Product>" "<Major Version>" "<OS>" "<Minor Version>"]
```

## Parameters

| Parameter         | Description                                                                                                                                |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| del   delete      | When you do not specify optional parameters, the command runs in the interactive mode. The command shows the menu with applicable options. |
| "<Vendor>"        | Specifies the package vendor. Enclose in double quotes.                                                                                    |
| "<Product>"       | Specifies the product name. Enclose in double quotes.                                                                                      |
| "<Major Version>" | Specifies the package Major Version. Enclose in double quotes.                                                                             |
| "<OS>"            | Specifies the package OS. Enclose in double quotes.                                                                                        |
| "<Minor Version>" | Specifies the package Minor Version. Enclose in double quotes.                                                                             |

### Notes:

- To see the values for the optional parameters, run the ["cppkg print" on page 178](#) command.
- You must specify all optional parameters, or no parameters.

## Example 1 - Interactive mode

```
[Expert@MGMT:0]# cppkg delete

Select package:
-----
(0) Delete all
(1) CP1100 Gaia Embedded Check Point R77.20 R77.20

(e) Exit

Enter your choice : 1

You chose to delete 'CP1100 Gaia Embedded Check Point R77.20 R77.20', Is this correct? [y/n] : y

Package was successfully removed from the repository
[Expert@MGMT:0]#
```

## Example 2 - Manually deleting the specified package

```
Expert@MGMT:0]# cppkg print
Vendor          Product          Version  OS          Minor Version
-----
Check Point     CP1100             R77.20   Gaia Embedded  R77.20
[Expert@MGMT:0]#

[Expert@MGMT:0]# cppkg delete "Check Point" "CP1100" "R77.20" "Gaia Embedded" "R77.20"
Package was successfully removed from the repository
[Expert@MGMT:0]#
```

# cppkg get

## Description

Updates the list of the SmartUpdate software packages in the SmartUpdate software packages repository based on the real content of the repository.

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the MDS (run the `mdsenv` command).

## Syntax

```
cppkg get
```

## Example

```
[Expert@MGMT:0]# cppkg get
Update successfully completed
[Expert@MGMT:0]#
```

# cppkg getroot

## Description

Shows the path to the root directory of the SmartUpdate software packages repository (the value of the environment variable `$SUROOT`)

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the MDS (run the `mdsenv` command).

## Syntax

```
cppkg getroot
```

## Example

```
[Expert@MGMT:0]# cppkg getroot
[cppkg 7119 4128339728]@MGMT[29 May 19:16:06] Current repository root is set to :
/var/log/cpupgrade/suroot
[Expert@MGMT:0]#
```

# cppkg print

## Description

Prints the list of SmartUpdate software packages in the SmartUpdate software packages repository.

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the MDS (run the `mdsenv` command).

## Syntax

```
cppkg print
```

### Example - R77.20 HFA\_75 (R77.20.75) firmware package for 1100 Appliances

```
[Expert@MGMT:0]# cppkg print
Vendor          Product          Version  OS          Minor Version
-----
Check Point     CP1100             R77.20Gaia Embedded  R77.20
[Expert@MGMT:0]#
```

# cppkg setroot

## Description

Configures the path to the root directory of the SmartUpdate software packages repository.

## Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the MDS (run the `mdsenv` command).
- The default path is: `/var/log/cpupgrade/suroot`
- When changing repository root directory:
  - This command copies the software packages from the old repository to the new repository. A package in the new location is overwritten by a package from the old location, if the packages have the same name.
  - This command updates the value of the environment variable `$SUROOT` in the Check Point Profile shell scripts (`$CPDIR/tmp/.CPprofile.sh` and `$CPDIR/tmp/.CPprofile.csh`).

## Syntax

```
cppkg setroot <Full Path to Repository Root Directory>
```

## Example

```
[Expert@MGMT:0]# cppkg setroot /var/log/my_directory

Repository root is set to : /var/log/cpupgrade/suroot

Note : When changing repository root directory :

    1. Old repository content will be copied into the new repository
    2. A package in the new location will be overwritten by a package in the old
       location, if the packages have the same name

Change the current repository root ? [y/n] : y

The new repository directory does not exist. Create it ? [y/n] : y

Repository root was set to : /var/log/my_directory

Notice : To complete the setting of your directory, reboot the machine!
[Expert@MGMT:0]#
```

# cpprod\_util

## Description

This utility works with Check Point Registry (\$CPDIR/registry/HKLM\_registry.data) without manually opening it:

- Shows which Check Point products and features are enabled on this Check Point server.
- Enables and disables Check Point products and features on this Check Point server.

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cpprod_util CPPROD_GetValue "<Product>" "<Parameter>" {0|1}
```

```
cpprod_util CPPROD_SetValue "<Product>" "<Parameter>" {1|4}
"<Value>" {0|1}
```

```
cpprod_util -dump
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cpprod_util CPPROD_GetValue "<Product>" "<Parameter>" {0|1}
```

```
cpprod_util CPPROD_SetValue "<Product>" "<Parameter>" {1|4}
"<Value>" {0|1}
```

```
cpprod_util -dump
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpprod_util CPPROD_GetValue "<Product>" "<Parameter>" {0|1}
```

```
cpprod_util CPPROD_SetValue "<Product>" "<Parameter>" {1|4}
"<Value>" {0|1}
```

```
cpprod_util -dump
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpprod_util CPPROD_GetValue "<Product>" "<Parameter>" {0|1}
```

```
g_all cpprod_util CPPROD_SetValue "<Product>" "<Parameter>" {1|4}
"<Value>" {0|1}
```

```
g_all cpprod_util -dump
```

## Parameters

| Parameter             | Description                                                                                                                                                                                                                                                         |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CPPROD_<br>GetValue   | Gets the configuration status of the specified product or feature: <ul style="list-style-type: none"> <li>▪ 0 - Disabled</li> <li>▪ 1 - Enabled</li> </ul>                                                                                                          |
| CPPROD_<br>SetValue   | Sets the configuration for the specified product or feature.<br> <b>Important</b> - Do not run these commands unless explicitly instructed by Check Point Support or R&D to do so. |
| "<Product<br>>"       | Specifies the product or feature.                                                                                                                                                                                                                                   |
| "<<br>Parameter<br>>" | Specifies the configuration parameter for the specified product or feature.                                                                                                                                                                                         |
| "<Value>"             | Specifies the value of the configuration parameter for the specified product or feature: <ul style="list-style-type: none"> <li>▪ One of these integers: 0, 1, 4</li> <li>▪ A string</li> </ul>                                                                     |
| dump                  | Creates a dump file of the Check Point Registry (\$CPDIR/registry/HKLM_registry.data) in the current working directory.<br>The name of the output file is RegDump.                                                                                                  |

## Notes

- On a Multi-Domain Server, you must run this command in the context of the relevant Domain Management Server.
- If you run the "cprod\_util" command without parameters, it prints:
  - The list of all available products and features (for example, "FwIsFirewallMgmt", "FwIsLogServer", "FwIsStandAlone")
  - The type of the expected argument when you configure a product or feature ("no-parameter", "string-parameter", or "integer-parameter")
  - The type of the returned output ("status-output", or "no-output")
- To redirect the output of the "cprod\_util" command, it is necessary to redirect the *stderr* to *stdout*:

```
cprod_util <options> > <output file> 2>&1
```

Example:

```
cprod_util > /tmp/output_of_cprod_util.txt 2>&1
```

## Examples

### Example - Showing a list of all installed Check Point Products Packages on a Management Server

```
[Expert@MGMT:0]# cprod_util CPPROD_GetInstalledProducts

# cprid

## Description

Manages the Check Point Remote Installation Daemon (`cprid`).

This daemon is used for remote upgrade and installation of Check Point products on the managed Security Gateways.

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run these commands in the context of the MDS (`run mdsenv`).

## Commands

| Syntax                         | Description                                                                              |
|--------------------------------|------------------------------------------------------------------------------------------|
| <code>cpridstart</code>        | Starts the Check Point Remote Installation Daemon ( <code>cprid</code> ).                |
| <code>cpridstop</code>         | Stops the Check Point Remote Installation Daemon ( <code>cprid</code> ).                 |
| <code>run_cprid_restart</code> | Stops and then starts the Check Point Remote Installation Daemon ( <code>cprid</code> ). |

# cprinstall

## Description

Performs installation of Check Point product packages and associated operations on remote managed Security Gateways.

 **Important** - Installing software packages with this command is not supported for Security Gateways that run on Gaia OS.

 **Notes:**

- This command requires a license for SmartUpdate.
- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

- On the remote Security Gateways these are required:
  - SIC Trust must be established between the Security Management Server and the Security Gateway.
  - The `cpd` daemon must run.
  - The `cpuid` daemon must run.

## Syntax

```
cprinstall
  boot <options>
  cprestart <options>
  cpstart <options>
  cpstop <options>
  delete <options>
  get <options>
  install <options>
  revert <options>
  show <options>
  snapshot <options>
  transfer <options>
  uninstall <options>
  verify <options>
```

## Parameters

| Parameter                                              | Description                                                                                                                                                                                                                                                                              |
|--------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>boot</code><br><code>&lt;options&gt;</code>      | Reboots the managed Security Gateway.<br>See <a href="#">"cprinstall boot" on page 190</a> .                                                                                                                                                                                             |
| <code>cprestart</code><br><code>&lt;options&gt;</code> | Runs the <code>cprestart</code> command on the managed Security Gateway.<br>See <a href="#">"cprinstall cprestart" on page 191</a> .                                                                                                                                                     |
| <code>cpstart</code><br><code>&lt;options&gt;</code>   | Runs the <code>cpstart</code> command on the managed Security Gateway.<br>See <a href="#">"cprinstall cpstart" on page 192</a> .                                                                                                                                                         |
| <code>cpstop</code><br><code>&lt;options&gt;</code>    | Runs the <code>cpstop</code> command on the managed Security Gateway.<br>See <a href="#">"cprinstall cpstop" on page 193</a> .                                                                                                                                                           |
| <code>delete</code><br><code>&lt;options&gt;</code>    | Deletes a snapshot (backup) file on the managed Security Gateway.<br>See <a href="#">"cprinstall delete" on page 194</a> .                                                                                                                                                               |
| <code>get</code><br><code>&lt;options&gt;</code>       | <ul style="list-style-type: none"> <li>■ Gets details of the products and the operating system installed on the managed Security Gateway.</li> <li>■ Updates the management database on the Security Management Server.</li> </ul><br>See <a href="#">"cprinstall get" on page 195</a> . |
| <code>install</code><br><code>&lt;options&gt;</code>   | Installs Check Point products on the managed Security Gateway.<br>See <a href="#">"cprinstall install" on page 196</a> .                                                                                                                                                                 |
| <code>revert</code><br><code>&lt;options&gt;</code>    | Restores the managed Security Gateway that runs on SecurePlatform OS from a snapshot saved on that Security Gateway.<br>See <a href="#">"cprinstall revert" on page 199</a> .                                                                                                            |

# cprinstall boot

## Description

Reboots the managed Security Gateway.

### Notes:

- You must run this command from the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsend <IP Address or Name of Domain Management Server>
```

## Syntax

```
cprinstall boot <Object Name>
```

## Parameters

| Parameter                  | Description                                                            |
|----------------------------|------------------------------------------------------------------------|
| <i>&lt;Object Name&gt;</i> | The name of the Security Gateway object as configured in SmartConsole. |

## Example

```
[Expert@MGMT]# cprinstall boot MyGW
```

# cprinstall cprestart

## Description

Runs the `cprestart` command on the managed Security Gateway.

 **Notes:**

- You must run this command from the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsend <IP Address or Name of Domain Management Server>
```

- All Check Point products on the managed Security Gateway must be of the same version.

## Syntax

```
cprinstall cprestart <Object Name>
```

## Parameters

| Parameter                  | Description                                                            |
|----------------------------|------------------------------------------------------------------------|
| <i>&lt;Object Name&gt;</i> | The name of the Security Gateway object as configured in SmartConsole. |

## Example

```
[Expert@MGMT:0]# cprinstall cprestart MyGW
```

# cprinstall cpstart

## Description

Runs the `cpstart` command on the managed Security Gateway.

### Notes:

- You must run this command from the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsend <IP Address or Name of Domain Management Server>
```

- All Check Point products on the managed Security Gateway must be of the same version.

## Syntax

```
cprinstall cpstart <Object Name>
```

## Parameters

| Parameter                  | Description                                                            |
|----------------------------|------------------------------------------------------------------------|
| <i>&lt;Object Name&gt;</i> | The name of the Security Gateway object as configured in SmartConsole. |

## Example

```
[Expert@MGMT]# cprinstall cpstart MyGW
```

# cprinstall cpstop

## Description

Runs the `cpstop` command on the managed Security Gateway.

 **Notes:**

- You must run this command from the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

mdsenv <IP Address or Name of Domain Management Server>

- All Check Point products on the managed Security Gateway must be of the same version.

## Syntax

cprinstall cpstop {-proc | -nopolicy} <Object Name>

## Parameters

| Parameter     | Description                                                                                                                                                                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -proc         | Kills the Check Point daemons and Security Servers, while it maintains the active Security Policy running in the Check Point kernel.<br>Rules with generic <i>Allow</i> , <i>Drop</i> or <i>Reject</i> action based on services, continue to work. |
| -nopolicy     | Kills the Check Point daemons and Security Servers and unloads the Security Policy from the Check Point kernel.                                                                                                                                    |
| <Object Name> | The name of the Security Gateway object as configured in SmartConsole.                                                                                                                                                                             |

## Example

[Expert@MGMT]# cprinstall cpstop -proc MyGW

# cprinstall delete

## Description

Deletes a snapshot (backup) file on the managed Security Gateway that runs on SecurePlatform OS.

### Notes:

- You must run this command from the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
cprinstall delete <Object Name> <Snapshot File>
```

## Parameters

| Parameter       | Description                                                            |
|-----------------|------------------------------------------------------------------------|
| <Object Name>   | The name of the Security Gateway object as configured in SmartConsole. |
| <Snapshot File> | Specifies the name of the snapshot (backup) on SecurePlatform OS.      |

## Example

```
[Expert@MGMT]# cprinstall delete MyGW Snapshot25Apr2017
```

# cprinstall get

## Description

- Gets details of the products and the operating system installed on the managed Security Gateway.
- Updates the management database on the Security Management Server.

 **Notes:**

- You must run this command from the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
cprinstall get <Object Name>
```

## Parameters

| Parameter     | Description                                                            |
|---------------|------------------------------------------------------------------------|
| <Object Name> | The name of the Security Gateway object as configured in SmartConsole. |

## Example:

```
[Expert@MGMT]# cprinstall get MyGW
Checking cprid connection...
Verified
Operation completed successfully
Updating machine information...
Update successfully completed
'Get Gateway Data' completed successfully
Operating system      Major Version      Minor Version
-----
SecurePlatform        R75.20R75.20

Vendor                Product            Major Version      Minor Version
-----
Check Point           VPN-1 Power/UTM    R75.20R75.20Check Point           SecurePlatform
R75.20R75.20Check Point           SmartPortal        R75.20R75.20
[Expert@MGMT]#
```

# cprinstall install

## Description

Installs Check Point products on the managed Security Gateway.

 **Important** - Installing software packages with this command is not supported for Security Gateways that run Gaia OS.

 **Notes:**

- Before transferring the software package, this command runs the "[cprinstall verify](#)" on page 206 command.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

- To see the values for the package attributes, run the "[cppkg print](#)" on page 178 command.

## Syntax

```
cprinstall install [-boot] [-backup] [-skip_transfer] <Object  
Name> "<Vendor>" "<Product>" "<Major Version>" "<Minor Version>"
```

## Parameters

| Parameter                            | Description                                                                                                                                                                                                                                       |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-boot</code>                   | Reboots the managed Security Gateway after installing the package.<br><b>Note</b> - Only reboot after ALL products have the same version. Reboot is canceled in certain scenarios.                                                                |
| <code>-backup</code>                 | Creates a snapshot on the managed Security Gateway before installing the package.<br><b>Note</b> - Only on Security Gateways that runs on SecurePlatform OS.                                                                                      |
| <code>-skip_transfer</code>          | Skip the transfer of the package.                                                                                                                                                                                                                 |
| <code>&lt;Object Name&gt;</code>     | The name of the Security Gateway object as configured in SmartConsole.                                                                                                                                                                            |
| <code>"&lt;Vendor&gt;"</code>        | Specifies the package vendor. Enclose in double quotes.<br>Example: <ul style="list-style-type: none"> <li>■ checkpoint</li> <li>■ Check Point</li> </ul>                                                                                         |
| <code>"&lt;Product&gt;"</code>       | Specifies the product name. Enclose in double quotes.<br>Examples: <ul style="list-style-type: none"> <li>■ SVNfoundation</li> <li>■ firewall</li> <li>■ floodgate</li> <li>■ CP1100</li> <li>■ VPN-1 Power/UTM</li> <li>■ SmartPortal</li> </ul> |
| <code>"&lt;Major Version&gt;"</code> | Specifies the package Major Version. Enclose in double quotes.                                                                                                                                                                                    |
| <code>"&lt;Minor Version&gt;"</code> | Specifies the package Minor Version. Enclose in double quotes.                                                                                                                                                                                    |

## Example

```
[Expert@MGMT]# cprinstall install -boot MyGW "checkpoint" "firewall" "R75" "R75.20"

# cprinstall revert

## Description

Restores the managed Security Gateway that runs on SecurePlatform OS from a snapshot saved on that Security Gateway.

 **Notes:**

- You must run this command from the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
cprinstall revert <Object Name> <Snapshot File>
```

## Parameters

| Parameter       | Description                                                                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <Object Name>   | The name of the Security Gateway object as configured in SmartConsole.                                                                                    |
| <Snapshot File> | Name of the SecurePlatform snapshot file.<br>To see the names of the saved snapshot files, run the <a href="#">"cprinstall show" on page 200</a> command. |

# cprinstall show

## Description

Displays all snapshot (backup) files on the managed Security Gateway that runs on SecurePlatform OS.

 **Notes:**

- You must run this command from the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
cprinstall show <Object Name>
```

## Parameters

| Parameter     | Description                                                            |
|---------------|------------------------------------------------------------------------|
| <Object Name> | The name of the Security Gateway object as configured in SmartConsole. |

## Example

```
[Expert@MGMT]# cprinstall show GW1
SU_backup.tzg
[Expert@MGMT]#
```

# cprinstall snapshot

## Description

Creates a snapshot on the managed Security Gateway that runs on SecurePlatform OS and saves it on that Security Gateway.

### Notes:

- You must run this command from the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsensv <IP Address or Name of Domain Management Server>
```

## Syntax

```
cprinstall snapshot <Object Name> <Snapshot File>
```

## Parameters

| Parameter                    | Description                                                                                                                                               |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;Object Name&gt;</i>   | The name of the Security Gateway object as configured in SmartConsole.                                                                                    |
| <i>&lt;Snapshot File&gt;</i> | Name of the SecurePlatform snapshot file.<br>To see the names of the saved snapshot files, run the <a href="#">"cprinstall show" on page 200</a> command. |

# cprinstall transfer

## Description

Transfers a software package from the repository to the managed Security Gateway without installing the package.

### Notes:

- You must run this command from the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

- To see the values for the package attributes, run the ["cppkg print" on page 178](#) command.

## Syntax

```
cprinstall transfer <Object Name> "<Vendor>" "<Product>" "<Major Version>" "<Minor Version>"
```

## Parameters

| Parameter                            | Description                                                                                                                                                                                     |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;Object Name&gt;</code>     | The name of the Security Gateway object as configured in SmartConsole.                                                                                                                          |
| <code>"&lt;Vendor&gt;"</code>        | Specifies the package vendor. Enclose in double quotes.<br>Example: <ul style="list-style-type: none"> <li>■ checkpoint</li> <li>■ Check Point</li> </ul>                                       |
| <code>"&lt;Product&gt;"</code>       | Specifies the product name. Enclose in double quotes.<br>Examples: <ul style="list-style-type: none"> <li>■ SVNfoundation</li> <li>■ firewall</li> <li>■ floodgate</li> <li>■ CP1100</li> </ul> |
| <code>"&lt;Major Version&gt;"</code> | Specifies the package major version. Enclose in double quotes.                                                                                                                                  |
| <code>"&lt;Minor Version&gt;"</code> | Specifies the package minor version. Enclose in double quotes.                                                                                                                                  |

# cprinstall uninstall

## Description

Uninstalls Check Point products on the managed Security Gateway.

 **Important** - Uninstalling software packages with this command is not supported for Security Gateways running on Gaia OS.

 **Notes:**

- You must run this command from the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsensv <IP Address or Name of Domain Management Server>
```

- Before uninstalling product packages, this command runs the "[cprinstall verify on page 206](#)" command.
- After uninstalling a product package, you must run the "[cprinstall get on page 195](#)" command.
- To see the values for the package attributes, run the "[cppkg print on page 178](#)" command.

## Syntax

```
cprinstall uninstall [-boot] <Object Name> "<Vendor>" "<Product>"  
"<Major Version>" "<Minor Version>"
```

## Parameters

| Parameter         | Description                                                                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -boot             | Reboots the managed Security Gateway after uninstalling the package.<br><b>Note</b> - Reboot is canceled in certain scenarios.                                                                  |
| <Object Name>     | The name of the Security Gateway object as configured in SmartConsole.                                                                                                                          |
| "<Vendor>"        | Specifies the package vendor. Enclose in double quotes.<br>Example: <ul style="list-style-type: none"> <li>■ checkpoint</li> <li>■ Check Point</li> </ul>                                       |
| "<Product>"       | Specifies the product name. Enclose in double quotes.<br>Examples: <ul style="list-style-type: none"> <li>■ SVNfoundation</li> <li>■ firewall</li> <li>■ floodgate</li> <li>■ CP1100</li> </ul> |
| "<Major Version>" | Specifies the package major version. Enclose in double quotes.                                                                                                                                  |
| "<Minor Version>" | Specifies the package minor version. Enclose in double quotes.                                                                                                                                  |

## Example

```
[Expert@MGMT]# cprinstall uninstall MyGW "checkpoint" "firewall" "R75.20" "R75.20"
Uninstalling firewall R75.20 from MyGW...
Info : Removing package from Check Point Gateway
Info : Product was successfully applied.
Operation Success. Please get network object data to complete the operation.
[Expert@MGMT]#
[Expert@MGMT]# cprinstall get
```

# cprinstall verify

## Description

Confirms these operations were successful:

- If a specific product can be installed on the managed Security Gateway.
- That the operating system and currently installed products the managed Security Gateway are appropriate for the software package.
- That there is enough disk space to install the product the managed Security Gateway.
- That there is a CPRID connection with the managed Security Gateway.

## Notes:

- You must run this command from the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

- To see the values for the package attributes, run the ["cppkg print" on page 178](#) command.

## Syntax

```
cprinstall verify <Object Name> "<Vendor>" "<Product>" "<Major Version>" ["<Minor Version>"]
```

## Parameters

| Parameter                            | Description                                                                                                                                                                                                                                       |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;Object Name&gt;</code>     | The name of the Security Gateway object as configured in SmartConsole.                                                                                                                                                                            |
| <code>"&lt;Vendor&gt;"</code>        | Specifies the package vendor. Enclose in double quotes.<br>Example: <ul style="list-style-type: none"> <li>■ checkpoint</li> <li>■ Check Point</li> </ul>                                                                                         |
| <code>"&lt;Product&gt;"</code>       | Specifies the product name. Enclose in double quotes.<br>Examples: <ul style="list-style-type: none"> <li>■ SVNfoundation</li> <li>■ firewall</li> <li>■ floodgate</li> <li>■ CP1100</li> <li>■ VPN-1 Power/UTM</li> <li>■ SmartPortal</li> </ul> |
| <code>"&lt;Major Version&gt;"</code> | Specifies the package major version. Enclose in double quotes.                                                                                                                                                                                    |
| <code>"&lt;Minor Version&gt;"</code> | Specifies the package minor version. Enclose in double quotes.<br>This parameter is optional.                                                                                                                                                     |

### Example 1 - Verification succeeds

```
[Expert@MGMT]# cprinstall verify MyGW "checkpoint" "SVNfoundation" "R75.20"
Verifying installation of SVNfoundation R75.20 on MyGW...
Info : Testing Check Point Gateway.
Info : Test completed successfully.
Info : Installation Verified, The product can be installed.
```

### Example 2 - Verification fails

```
[Expert@MGMT]# cprinstall verify MyGW "checkpoint" "SVNfoundation" "R75.20"
Verifying installation of SVNfoundation R75.20 on MyGW...
Info : Testing Check Point Gateway
Info : SVN Foundation R75 is already installed on 192.0.2.134
Operation Success. Product cannot be installed, did not pass dependency check.
```

# cpstat

## Description

Shows the status and statistics information for Check Point applications.

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cpstat [-d] [-h <Host>] [-p <Port>] [-s <SICName>] [-f <Flavor>]  
[-o <Polling Interval> [-c <Count>] [-e <Period>]] <Application  
Flag>
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cpstat [-d] [-h <Host>] [-p <Port>] [-s <SICName>] [-f <Flavor>]  
[-o <Polling Interval> [-c <Count>] [-e <Period>]] <Application  
Flag>
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpstat [-d] [-h <Host>] [-p <Port>] [-s <SICName>] [-f <Flavor>]  
[-o <Polling Interval> [-c <Count>] [-e <Period>]] <Application  
Flag>
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpstat [-d] [-h <Host>] [-p <Port>] [-s <SICName>] [-f  
<Flavor>] [-o <Polling Interval> [-c <Count>] [-e <Period>]]  
<Application Flag>
```

**Note** - You can write the parameters in the syntax in any order.

## Parameters

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d           | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> <p>The output shows the SNMP queries and SNMP responses for the applicable SNMP OIDs.</p>                                                                                                                                        |
| -h <Host>    | <p>Optional.<br/>When you run this command on a Management Server, this parameter specifies the managed Security Gateway / ClusterXL object.<br/>&lt;Host&gt; is an IPv4 address, a resolvable hostname, or a DAIP object name.<br/>The default is <code>localhost</code>.</p> <p> <b>Note</b> - On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:<br/><code>mdsensv &lt;IP Address or Name of Domain Management Server&gt;</code>.</p> |
| -p <Port>    | <p>Optional.<br/>Port number of the Application Monitoring (AMON) server.<br/>The default port is 18192.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| -s <SICname> | <p>Optional.<br/>Secure Internal Communication (SIC) name of the Application Monitoring (AMON) server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| -f <Flavor>  | <p>Optional.<br/>Specifies the type of the information to collect.<br/>If you do not specify a flavor explicitly, the command uses the first flavor in the &lt;Application Flag&gt;. To see all flavors, run the <code>cpstat</code> command without any parameters.</p>                                                                                                                                                                                                                                                                                                              |

| Parameter                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-o &lt;Polling Interval&gt;</code> | <p>Optional.</p> <p>Specifies the polling interval (in seconds) - how frequently the command collects and shows the information.</p> <p>Examples:</p> <ul style="list-style-type: none"> <li>▪ 0 - The command shows the results only once and then stops (this is the default value).</li> <li>▪ 5 - The command shows the results every 5 seconds in the loop.</li> <li>▪ 30 - The command shows the results every 30 seconds in the loop.</li> <li>▪ N - The command shows the results every N seconds in the loop.</li> </ul> <p>Use this parameter together with the "<code>-c &lt;Count&gt;</code>" parameter and the "<code>-e &lt;Period&gt;</code>" parameter.</p> <p>Example:</p> <pre>cpstat os -f perf -o 2</pre>                                                                                                |
| <code>-c &lt;Count&gt;</code>            | <p>Optional.</p> <p>Specifies how many times the command runs and shows the results before it stops.</p> <p>You must use this parameter together with the "<code>-o &lt;Polling Interval&gt;</code>" parameter.</p> <p>Examples:</p> <ul style="list-style-type: none"> <li>▪ 0 - The command shows the results repeatedly every <code>&lt;Polling Interval&gt;</code> (this is the default value).</li> <li>▪ 10 - The command shows the results 10 times every <code>&lt;Polling Interval&gt;</code> and then stops.</li> <li>▪ 20 - The command shows the results 20 times every <code>&lt;Polling Interval&gt;</code> and then stops.</li> <li>▪ N - The command shows the results N times every <code>&lt;Polling Interval&gt;</code> and then stops.</li> </ul> <p>Example:</p> <pre>cpstat os -f perf -o 2 -c 2</pre> |

| Parameter                             | Description                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-e &lt;Period&gt;</code>        | <p>Optional.</p> <p>Specifies the time (in seconds), over which the command calculates the statistics.</p> <p>You must use this parameter together with the "<code>-o &lt;Polling Interval&gt;</code>" parameter.</p> <p>You can use this parameter together with the "<code>-c &lt;Count&gt;</code>" parameter.</p> <p>Example:</p> <pre>cpstat os -f perf -o 2 -c 2 -e 60</pre> |
| <code>&lt;Application Flag&gt;</code> | <p>Mandatory.</p> <p>See the table below with flavors for the application flags.</p>                                                                                                                                                                                                                                                                                              |

### These flavors are available for the application flags

 **Note** - The available flags depend on the enabled Software Blades. Some flags are supported only by a Security Gateway / ClusterXL, and some flags are supported only by a Management Server.

| Feature or Software Blade       | Flag   | Flavors                                                                                                                                                                                                                         |
|---------------------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

# cpwd\_admin

## Description

The Check Point WatchDog (`cpwd`) is a process that invokes and monitors critical processes such as Check Point daemons on the local server, and attempts to restart them if they fail.

Among the processes monitored by Watchdog are `fwm`, `fwd`, `cpd`, `DAService`, and others.

The list of monitored processes depends on the installed and configured Check Point products and Software Blades.

The Check Point WatchDog writes monitoring information to the `$CPDIR/log/cpwd.elg` log file.

The `cpwd_admin` utility shows the status of the monitored processes, and configures the Check Point WatchDog.

## There are two types of Check Point WatchDog monitoring

| Monitoring | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Passive    | <p>WatchDog restarts the process only when the process terminates abnormally.</p> <p>In the output of the <code>cpwd_admin list</code> command, the <code>MON</code> column shows <code>N</code> for passively monitored processes.</p>                                                                                                                                                                                                                             |
| Active     | <p>WatchDog checks the process status every predefined interval. WatchDog makes sure the process is alive, as well as properly functioning (not stuck on deadlocks, frozen, and so on).</p> <p>In the output of the <code>cpwd_admin list</code> command, the <code>MON</code> column shows <code>Y</code> for actively monitored processes.</p> <p>The list of actively monitored processes is predefined by Check Point. Users cannot change or configure it.</p> |

**Syntax on a Management Server in Gaia Clish or the Expert mode**

```
cpwd_admin
    config <options>
    del <options>
    detach <options>
    exist
    flist <options>
    getpid <options>
    kill
    list <options>
    monitor_list
    start <options>
    start_monitor
    stop <options>
    stop_monitor
```

**Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode**

```
cpwd_admin
    config <options>
    del <options>
    detach <options>
    exist
    flist <options>
    getpid <options>
    kill
    list <options>
    monitor_list
    start <options>
    start_monitor
    stop <options>
    stop_monitor
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpwd_admin
    config <options>
    del <options>
    detach <options>
    exist
    flist <options>
    getpid <options>
    kill
    list <options>
    monitor_list
    start <options>
    start_monitor
    stop <options>
    stop_monitor
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpwd_admin
    config <options>
    del <options>
    detach <options>
    exist
    flist <options>
    getpid <options>
    kill
    list <options>
    monitor_list
    start <options>
    start_monitor
    stop <options>
    stop_monitor
```

## Parameters

| Parameter           | Description                                                                                   |
|---------------------|-----------------------------------------------------------------------------------------------|
| config<br><options> | Configures the Check Point WatchDog.<br>See <a href="#">"cpwd_admin config" on page 224</a> . |

| Parameter           | Description                                                                                                                                                                                                                                                                                               |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| del<br><options>    | Temporarily deletes a monitored process from the WatchDog database of monitored processes.<br>See <a href="#">"cpwd_admin del" on page 229</a> .                                                                                                                                                          |
| detach<br><options> | Temporarily detaches a monitored process from the WatchDog monitoring.<br>See <a href="#">"cpwd_admin detach" on page 231</a> .                                                                                                                                                                           |
| exist               | Checks whether the WatchDog process cpwd is alive.<br>See <a href="#">"cpwd_admin exist" on page 233</a> .                                                                                                                                                                                                |
| flist<br><options>  | Saves the status of all monitored processes to a \$CPDIR/tmp/cpwd_list_<Epoch Timestamp>.lst file.<br>See <a href="#">"cpwd_admin flist" on page 234</a> .                                                                                                                                                |
| getpid<br><options> | Shows the PID of a monitored process.<br>See <a href="#">"cpwd_admin getpid" on page 236</a> .                                                                                                                                                                                                            |
| kill<br><options>   | Terminates the WatchDog process cpwd.<br>See <a href="#">"cpwd_admin kill" on page 237</a> .<br> <b>Important</b> - Do <b>not</b> run this command unless explicitly instructed by Check Point Support or R&D to do so. |
| list                | Prints the status of all monitored processes on the screen.<br>See <a href="#">"cpwd_admin list" on page 238</a> .                                                                                                                                                                                        |
| monitor_<br>list    | Prints the status of actively monitored processes on the screen.<br>See <a href="#">"cpwd_admin monitor_list" on page 243</a> .                                                                                                                                                                           |
| start<br><options>  | Starts a process as monitored by the WatchDog.<br>See <a href="#">"cpwd_admin start" on page 244</a> .                                                                                                                                                                                                    |
| start_<br>monitor   | Starts the active WatchDog monitoring - WatchDog monitors the predefined processes actively.<br>See <a href="#">"cpwd_admin start_monitor" on page 247</a> .                                                                                                                                              |
| stop<br><options>   | Stops a monitored process.<br>See <a href="#">"cpwd_admin stop" on page 248</a> .                                                                                                                                                                                                                         |
| stop_<br>monitor    | Stops the active WatchDog monitoring - WatchDog monitors all processes only passively.<br>See <a href="#">"cpwd_admin stop_monitor" on page 250</a> .                                                                                                                                                     |

## cpwd\_admin config

### Description

Configures the Check Point WatchDog.

-  **Important** - After changing the WatchDog configuration parameters, you must restart the WatchDog process with the "cpstop" and "cpstart" commands (which restart *all* Check Point processes).

**Syntax on a Management Server in Gaia Clish or the Expert mode**

```
cpwd_admin config
  -h
  -a <options>
  -d <options>
  -p
  -r
```

**Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode**

```
cpwd_admin config
  -h
  -a <options>
  -d <options>
  -p
  -r
```

**Syntax on a Scalable Platform Security Group in Gaia gClish**

```
cpwd_admin config
  -h
  -a <options>
  -d <options>
  -p
  -r
```

**Syntax on a Scalable Platform Security Group in the Expert mode**

```
g_all cpwd_admin config
  -h
  -a <options>
  -d <options>
  -p
  -r
```

## Parameters

| Parameter                                                                                                                | Description                                                                                                                                                                                                                                                      |
|--------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -h                                                                                                                       | Shows built-in usage.                                                                                                                                                                                                                                            |
| -a <Configuration_Parameter_1>=<Value_1> <Configuration_Parameter_2>=<Value_2> ... <Configuration_Parameter_N>=<Value_N> | <p>Adds the WatchDog configuration parameters.</p> <p> <b>Note</b> - Spaces are not allowed between the name of the configuration parameter, the equal sign, and the value.</p> |
| -d <Configuration_Parameter_1> <Configuration_Parameter_2> ... <Configuration_Parameter_N>                               | Deletes the WatchDog configuration parameters that user added with the "cpwd_admin config -a" command.                                                                                                                                                           |
| -p                                                                                                                       | Shows the WatchDog configuration parameters that user added with the "cpwd_admin config -a" command.                                                                                                                                                             |
| -r                                                                                                                       | Restores the default WatchDog configuration.                                                                                                                                                                                                                     |

These are the available configuration parameters and the accepted values:

| Configuration Parameter | Accepted Values                                                              | Description                                                                                                                                                                                                                                                                                |
|-------------------------|------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| default_ctx             | Text string up to 128 characters                                             | On a VSX Gateway, configures the CTX value that is assigned to monitored processes, for which no CTX is specified.                                                                                                                                                                         |
| display_ctx             | <ul style="list-style-type: none"> <li>▪ 0 (default)</li> <li>▪ 1</li> </ul> | <p>On a VSX Gateway, configures whether the WatchDog shows the CTX column in the output of the cpwd_admin list command (between the APP and the PID columns):</p> <ul style="list-style-type: none"> <li>▪ 0 - Does not show the CTX column</li> <li>▪ 1 - Shows the CTX column</li> </ul> |

| Configuration Parameter | Accepted Values                                                                        | Description                                                                                                                                                                                                                                                      |
|-------------------------|----------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| zero_timeout            | <ul style="list-style-type: none"> <li>Range: &gt; 0</li> <li>Default: 7200</li> </ul> | <p>After failing <code>no_limit</code> times to restart a process, the WatchDog waits <code>zero_timeout</code> seconds before it tries again.</p> <p>The value of the <code>zero_timeout</code> must be greater than the value of the <code>timeout</code>.</p> |

The WatchDog saves the user defined configuration parameters in the `$CPDIR/registry/HKLM_registry.data` file in the " : (Wd\_Config" section:

```
("CheckPoint Repository Set"
 : (SOFTWARE
   : (CheckPoint
     : (CPshared
       :CurrentVersion (6.0)
       : (6.0
         ... ..
         : (reserved
           ... ..
           : (Wd
             : (Wd_Config
               :Configuration_Parameter_1 (" [4]Value_1"):Configuration_Parameter_2 ("
 [4]Value_2")
             )
           )
         ... ..
```

## Example

```
[Expert@HostName:0]# cpwd_admin config -p
cpWatchDog doesn't have configuration parameters
[Expert@HostName:0]#
[Expert@HostName:0]# cpwd_admin config -a sleep_timeout=120 no_limit=12
[Expert@HostName:0]#
[Expert@HostName:0]# cpwd_admin config -p
cpWatchDog Configuration parameters are:
sleep_timeout : 120
no_limit : 12
[Expert@HostName:0]#
[Expert@HostName:0]# cpstop ; cpstart
[Expert@HostName:0]#

[Expert@HostName:0]# cpwd_admin config -r
cpWatchDog doesn't have configuration parameters
[Expert@HostName:0]#
[Expert@HostName:0]# cpstop ; cpstart
[Expert@HostName:0]#
[Expert@HostName:0]# cpwd_admin config -p
cpWatchDog doesn't have configuration parameters
[Expert@HostName:0]#
```

# cpwd\_admin del

## Description

Temporarily deletes a monitored process from the WatchDog database of monitored processes.

### Notes:

- WatchDog stops monitoring the detached process, but the process stays alive.
- The "[cpwd\\_admin list](#)" on [page 238](#) command does not show the deleted process anymore.
- This change applies until all Check Point services restart during boot, or with the "[cpstart](#)" on [page 208](#) command.

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cpwd_admin del -name <Application Name>
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cpwd_admin del -name <Application Name> [-ctx <VSID>]
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpwd_admin del -name <Application Name> [-ctx <VSID>]
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpwd_admin del -name <Application Name> [-ctx <VSID>]
```

## Parameters

| Parameter                             | Description                                                                                                                                                                                                                                                                              |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;Application Name&gt;</code> | <p>Name of the monitored Check Point process as you see in the output of the <a href="#">"cpwd_admin list" on page 238</a> command in the leftmost column APP.</p> <p>Examples:</p> <ul style="list-style-type: none"> <li>■ FWM</li> <li>■ FWD</li> <li>■ CPD</li> <li>■ CPM</li> </ul> |
| <code>-ctx &lt;VSID&gt;</code>        | On a VSX Gateway, specifies the context of the applicable Virtual System.                                                                                                                                                                                                                |

## Example

```
[Expert@HostName:0]# cpwd_admin del -name FWD
cpwd_admin:
successful Del operation
[Expert@HostName:0]#
```

# cpwd\_admin detach

## Description

Temporarily detaches a monitored process from the WatchDog monitoring.

### Notes:

- WatchDog stops monitoring the detached process, but the process stays alive.
- The "[cpwd\\_admin list](#)" on page 238 command does not show the detached process anymore.
- This change applies until all Check Point services restart during boot, or with the "[cpstart](#)" on page 208 command.

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cpwd_admin detach -name <Application Name>
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cpwd_admin detach -name <Application Name> [-ctx <VSID>]
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpwd_admin detach -name <Application Name> [-ctx <VSID>]
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpwd_admin detach -name <Application Name> [-ctx <VSID>]
```

## Parameters

| Parameter                             | Description                                                                                                                                                                                                                                                              |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;Application Name&gt;</code> | Name of the monitored Check Point process as you see in the output of the <a href="#">"cpwd_admin list" on page 238</a> command in the leftmost column APP.<br>Examples: <ul style="list-style-type: none"><li>■ FWM</li><li>■ FWD</li><li>■ CPD</li><li>■ CPM</li></ul> |
| <code>-ctx &lt;VSID&gt;</code>        | On a VSX Gateway, specifies the context of the applicable Virtual System.                                                                                                                                                                                                |

## Example

```
[Expert@HostName:0]# cpwd_admin detach -name FWD
cpwd_admin:
successful Detach operation
[Expert@HostName:0]#
```

# cpwd\_admin exist

## Description

Checks whether the WatchDog process `cpwd` is alive.

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cpwd_admin exist
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cpwd_admin exist
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpwd_admin exist
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpwd_admin exist
```

## Example

```
[Expert@HostName:0]# cpwd_admin exist  
cpwd_admin: cpWatchDog is running  
[Expert@HostName:0]#
```

# cpwd\_admin flist

## Description

Saves the status of all WatchDog monitored processes to a file.

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cpwd_admin flist [-full]
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cpwd_admin flist [-full] [-ctx <VSID>]
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpwd_admin flist [-full] [-ctx <VSID>]
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpwd_admin flist [-full] [-ctx <VSID>]
```

## Parameters

| Parameter   | Description                                                               |
|-------------|---------------------------------------------------------------------------|
| -full       | Shows the verbose output.                                                 |
| -ctx <VSID> | On a VSX Gateway, specifies the context of the applicable Virtual System. |

## Output

| Column     | Description                                                                                                                                                                                                                       |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APP        | Shows the WatchDog name of the monitored process.                                                                                                                                                                                 |
| CTX        | On a VSX Gateway, shows the VSID, in which the monitored process runs.                                                                                                                                                            |
| PID        | Shows the PID of the monitored process.                                                                                                                                                                                           |
| STAT       | Shows the status of the monitored process: <ul style="list-style-type: none"> <li>▪ E - executing</li> <li>▪ T - terminated</li> </ul>                                                                                            |
| #START     | Shows how many times the WatchDog started the monitored process.                                                                                                                                                                  |
| START_TIME | Shows the time when the WatchDog started the monitored process for the last time.                                                                                                                                                 |
| SLP/LIMIT  | In verbose output, shows the values of the <code>sleep_timeout</code> and <code>no_limit</code> configuration parameters (see <a href="#">"cpwd_admin config" on page 224</a> ).                                                  |
| MON        | Shows how the WatchDog monitors this process (see the explanation for the <a href="#">"cpwd_admin" on page 220</a> ): <ul style="list-style-type: none"> <li>▪ Y - Active monitoring</li> <li>▪ N - Passive monitoring</li> </ul> |
| COMMAND    | Shows the command the WatchDog run to start this process.                                                                                                                                                                         |

## Example

```
[Expert@HostName:0]# cpwd_admin flist
/opt/CPshrd-R82.10/tmp/cpwd_list_1564617600.lst
[Expert@HostName:0]#
```

# cpwd\_admin getpid

## Description

Shows the PID of a WatchDog monitored process.

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cpwd_admin getpid -name <Application Name>
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cpwd_admin getpid -name <Application Name> [-ctx <VSID>]
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpwd_admin getpid -name <Application Name> [-ctx <VSID>]
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpwd_admin getpid -name <Application Name> [-ctx <VSID>]
```

## Parameters

| Parameter          | Description                                                                                                                                                                                                                                                                |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <Application Name> | Name of the monitored Check Point process as you see in the output of the " <a href="#">cpwd_admin list</a> " on page 238 command in the leftmost column APP.<br>Examples: <ul style="list-style-type: none"><li>■ FWM</li><li>■ FWD</li><li>■ CPD</li><li>■ CPM</li></ul> |
| -ctx <VSID>        | On VSX Gateway, specifies the context of the applicable Virtual System.                                                                                                                                                                                                    |

## Example

```
[Expert@HostName:0]# cpwd_admin getpid -name FWD
5640
[Expert@HostName:0]#
```

# cpwd\_admin kill

## Description

Terminates the WatchDog process `cpwd`.

**Important** - Do **not** run this command unless explicitly instructed by Check Point Support or R&D to do so.

To restart the WatchDog process, you must restart all Check Point services with the *"cpstop" on page 219* and *"cpstart" on page 208* commands.

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cpwd_admin kill
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cpwd_admin kill
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpwd_admin kill
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpwd_admin kill
```

# cpwd\_admin list

## Description

Prints the status of all WatchDog monitored processes on the screen.

**Note** - By default, WatchDog monitors a maximum of 10000 processes.

To increase this threshold, use the command "cpwd\_admin config -a num\_of\_procs=<value>".

See "[cpwd\\_admin config](#)" on page 224.

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cpwd_admin list [-full]
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cpwd_admin list [-full] [-ctx <VSID>]
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpwd_admin list [-full] [-ctx <VSID>]
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpwd_admin list [-full] [-ctx <VSID>]
```

## Parameters

| Parameter   | Description                                                               |
|-------------|---------------------------------------------------------------------------|
| -full       | Shows the verbose output.                                                 |
| -ctx <VSID> | On a VSX Gateway, specifies the context of the applicable Virtual System. |

## Output

| Column     | Description                                                                                                                                                                                                                       |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APP        | Shows the WatchDog name of the monitored process.                                                                                                                                                                                 |
| CTX        | On a VSX Gateway, shows the VSID, in which the monitored process runs.                                                                                                                                                            |
| PID        | Shows the PID of the monitored process.                                                                                                                                                                                           |
| STAT       | Shows the status of the monitored process: <ul style="list-style-type: none"> <li>▪ E - executing</li> <li>▪ T - terminated</li> </ul>                                                                                            |
| #START     | Shows how many times the WatchDog started the monitored process.                                                                                                                                                                  |
| START_TIME | Shows the time when the WatchDog started the monitored process for the last time.                                                                                                                                                 |
| SLP/LIMIT  | In verbose output, shows the values of the <code>sleep_timeout</code> and <code>no_limit</code> configuration parameters (see <a href="#">"cpwd_admin config" on page 224</a> ).                                                  |
| MON        | Shows how the WatchDog monitors this process (see the explanation for the <a href="#">"cpwd_admin" on page 220</a> ): <ul style="list-style-type: none"> <li>▪ Y - Active monitoring</li> <li>▪ N - Passive monitoring</li> </ul> |
| COMMAND    | Shows the command the WatchDog run to start this process.                                                                                                                                                                         |

## Examples

### Example - Default output on a Management Server

```
[Expert@HostName:0]# cpwd_admin list
APP      PID    STAT  #START  START_TIME      MON  COMMAND

```
[Expert@HostName:0]#
```

# cpwd\_admin monitor\_list

## Description

Prints the status of actively monitored processes on the screen.

See the explanation about the active monitoring in ["cpwd\\_admin" on page 220](#).

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cpwd_admin monitor_list
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cpwd_admin monitor_list
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpwd_admin monitor_list
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpwd_admin monitor_list
```

## Example

```
[Expert@HostName:0]# cpwd_admin monitor_list
cpwd_admin:
APP      FILE_NAME                NO_MSG_TIMES  LAST_MSG_TIME
CPD      CPD_5420_4714.mntr             0/10          [19:00:33] 31/5/2019
[Expert@HostName:0]#
```

# cpwd\_admin start

## Description

Starts a process as monitored by the WatchDog.

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cpwd_admin start -name <Application Name> -path "<Full Path to Executable>" -command "<Command Syntax>" [-env {inherit | <Env_Var>=<Value>} [-slp_timeout <Timeout>] [-retry_limit {<Limit> | u}]
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cpwd_admin start -name <Application Name> [-ctx <VSID>] -path "<Full Path to Executable>" -command "<Command Syntax>" [-env {inherit | <Env_Var>=<Value>} [-slp_timeout <Timeout>] [-retry_limit {<Limit> | u}]
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpwd_admin start -name <Application Name> [-ctx <VSID>] -path "<Full Path to Executable>" -command "<Command Syntax>" [-env {inherit | <Env_Var>=<Value>} [-slp_timeout <Timeout>] [-retry_limit {<Limit> | u}]
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpwd_admin start -name <Application Name> [-ctx <VSID>] -path "<Full Path to Executable>" -command "<Command Syntax>" [-env {inherit | <Env_Var>=<Value>} [-slp_timeout <Timeout>] [-retry_limit {<Limit> | u}]
```

## Parameters

| Parameter                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Example

For the list of process and the applicable syntax, see [sk97638](#).

# cpwd\_admin start\_monitor

## Description

Starts the active WatchDog monitoring. WatchDog monitors the predefined processes actively.

See the explanation for the ["cpwd\\_admin" on page 220](#) command.

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cpwd_admin start_monitor
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cpwd_admin start_monitor
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpwd_admin start_monitor
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpwd_admin start_monitor
```

## Example

```
[Expert@HostName:0]# cpwd_admin start_monitor
cpwd_admin:
CPWD has started to perform active monitoring on Check Point services/processes
[Expert@HostName:0]#
```

# cpwd\_admin stop

## Description

Stops a WatchDog monitored process.

**Important** - This change does **not** survive reboot.

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cpwd_admin stop -name <Application Name> [-path "<Full Path to Executable>" -command "<Command Syntax>" [-env {inherit | <Env_Var>=<Value>}]
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cpwd_admin stop -name <Application Name> [-ctx <VSID>] [-path "<Full Path to Executable>" -command "<Command Syntax>" [-env {inherit | <Env_Var>=<Value>}]
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpwd_admin stop -name <Application Name> [-ctx <VSID>] [-path "<Full Path to Executable>" -command "<Command Syntax>" [-env {inherit | <Env_Var>=<Value>}]
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpwd_admin stop -name <Application Name> [-ctx <VSID>] [-path "<Full Path to Executable>" -command "<Command Syntax>" [-env {inherit | <Env_Var>=<Value>}]
```

## Parameters

| <code>-env {inherit   &lt;Env_Var&gt;=&lt;Value&gt;}</code> | <p>Configures whether to inherit the environment variables from the shell.</p> <ul style="list-style-type: none"> <li>■ <code>inherit</code> - Inherits all the environment variables (WatchDog supports up to 80 environment variables)</li> <li>■ <code>&lt;Env_Var&gt;=&lt;Value&gt;</code> - Assigns the specified value to the specified environment variable</li> </ul> |

## Example

For the list of process and the applicable syntax, see [sk97638](#).

# cpwd\_admin stop\_monitor

## Description

Stops the active WatchDog monitoring. WatchDog monitors all processes only passively.

See the explanation for the ["cpwd\\_admin" on page 220](#) command.

## Syntax on a Management Server in Gaia Clish or the Expert mode

```
cpwd_admin stop_monitor
```

## Syntax on a Security Gateway / Cluster Member in Gaia Clish or the Expert mode

```
cpwd_admin stop_monitor
```

## Syntax on a Scalable Platform Security Group in Gaia gClish

```
cpwd_admin stop_monitor
```

## Syntax on a Scalable Platform Security Group in the Expert mode

```
g_all cpwd_admin stop_monitor
```

## Example

```
[Expert@HostName:0]# cpwd_admin stop_monitor
cpwd_admin:
CPWD has stopped performing active monitoring on Check Point services/processes
[Expert@HostName:0]#
```

# dbedit

## Description

Edits the management database - the `$FWDIR/conf/objects_5_0.C` file - on the Security Management Server or Domain Management Server. See [sk13301](#).

**Important** - Do NOT run this command, unless explicitly instructed by Check Point Support or R&D to do so. Otherwise, you can corrupt settings in the management database.

## Syntax

```
dbedit -help
```

```
dbedit [-globallock] [{-local | -s <Management_Server>}] [{-u
<Username> | -c <Certificate>}] [-p <Password>] [-f <File_Name>
[ignore_script_failure] [-continue_updating]] [-r "<Open_Reason_
Text>"] [-d <Database_Name>] [-listen] [-readonly] [-session]
```

**Note:**  
On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsend <IP Address or Name of Domain Management Server>
```

## Parameters

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -help       | Prints the general help.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| -globallock | When you work with the dedit utility, it partially locks the management database. If a user configures objects in SmartConsole at the same time, it causes problems in the management database. This option does not let SmartConsole, or a dedit user to make changes in the management database. When you specify this option, the dedit commands run on a copy of the management database. After you make the changes with the dedit commands and run the savedb command, the dedit utility saves and commits your changes to the actual management database. |
| -local      | Connects to the localhost (127.0.0.1) without using username/password. If you do not specify this parameter, the dedit utility asks how to connect.                                                                                                                                                                                                                                                                                                                                                                                                              |

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -s<br><Management_Server> | Specifies the Security Management Server - by IP address or HostName.<br>If you do not specify this parameter, the dbedit utility asks how to connect.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| -u<br><Username>          | Specifies the username, with which the dbedit utility connects to the Security Management Server.<br>Mandatory parameter when you specify the "-s <Management_Server>" parameter.                                                                                                                                                                                                                                                                                                                                                                                                             |
| -c<br><Certificate>       | Specifies the user's certificate file, with which the dbedit utility connects to the Security Management Server.<br>Mandatory parameter when you specify the "-s <Management_Server>" parameter.                                                                                                                                                                                                                                                                                                                                                                                              |
| -p<br><Password>          | Specifies the user's password, with which the dbedit utility connects to the Security Management Server.<br>Mandatory parameter when you specify the "-s <Management_Server>" and "-u <Username>" parameters.                                                                                                                                                                                                                                                                                                                                                                                 |
| -f <File_Name>            | Specifies the file that contains the applicable dbedit internal commands (see the section " <i>dbedit Internal Commands</i> " below): <ul style="list-style-type: none"> <li>■ create &lt;object_type&gt; &lt;object_name&gt;</li> <li>■ modify &lt;table_name&gt; &lt;object_name&gt; &lt;field_name&gt; &lt;value&gt;</li> <li>■ update &lt;table_name&gt; &lt;object_name&gt;</li> <li>■ delete &lt;table_name&gt; &lt;object_name&gt;</li> <li>■ print &lt;table_name&gt; &lt;object_name&gt;</li> <li>■ quit</li> </ul> <p><b>Note</b> - Each command is limited to 4096 characters.</p> |
| ignore_script_failure     | Continues to execute the dbedit internal commands in the file and ignores errors.<br>You can use it when you specify the "-f <File_Name>" parameter.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| -continue_updating        | Continues to update the modified objects, even if the operation fails for some of the objects (ignores the errors and runs the <code>update_all</code> command at the end of the script).<br>You can use it when you specify the "-f <File_Name>" parameter.                                                                                                                                                                                                                                                                                                                                  |
| -r "<Open_Reason_Text>"   | Specifies the reason for opening the database in read-write mode (default mode).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Parameter             | Description                                                                                                                                                                                                                           |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d<br><Database_Name> | Specifies the name of the database, to which the dbedit utility should connect (for example, mdsdb).                                                                                                                                  |
| -listen               | The dbedit utility "listens" for changes (use this mode for advanced troubleshooting with the assistance of Check Point Support).<br>The dbedit utility prints its internal messages when a change occurs in the management database. |
| -readonly             | Specifies to open the management database in read-only mode.                                                                                                                                                                          |
| -session              | Session Connectivity.                                                                                                                                                                                                                 |

### dbedit Internal Commands

**Note** - To see the available tables, class names (object types), attributes and values, connect to Management Server with Database Tool (GuiDBEdit Tool) (see [sk13009](#)).

| Command    | Description, Syntax, Examples                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -h         | <p><b>Description:</b><br/>Prints the general help.</p> <p><b>Syntax:</b></p> <pre>dbedit&gt; -h</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

# evstart

## Description

On a Multi-Domain Security Management Server, this command:

- Starts the SmartEvent Server and the SmartEvent Correlation Unit services, if you stopped them with the "evstop" command (see ["evstop" on page 632](#)).
- Starts only the SmartEvent Correlation Unit service, if you stopped it with the "evstop" command (see ["evstop" on page 632](#)).
- Can apply only to the **MDS** context.
- Can apply only to the specified Domain Management Server with the enabled SmartEvent Server and SmartEvent Correlation Unit Software Blades.

On a Multi-Domain Log Server, this command:

- Starts the SmartEvent Server and the SmartEvent Correlation Unit services, if you stopped them with the "evstop" command (see ["evstop" on page 632](#)).
- Starts only the SmartEvent Correlation Unit service, if you stopped it with the "evstop" command (see ["evstop" on page 632](#)).
- Can apply only to the **MDS** context.
- Can apply only to the specified Domain Log Server with the enabled SmartEvent Server and SmartEvent Correlation Unit Software Blades.

### Important:

- You can run this command only in the Expert mode.
- Multi-Domain Security Management Server / Multi-Domain Log Server runs this command automatically:
  - During boot.
  - When you run the "mdsstart" command (see ["mdsstart" on page 770](#)).
- Domain Management Server / Domain Log Server runs this command automatically when you run the "mdsstart\_customer" command (see ["mdsstart\\_customer" on page 774](#)).

## Related command

## Syntax

```
evstart [-analyzer]
        -m
        <IP Address or Name of Domain Management Server / Domain Log
        Server>
```

## Parameters

| Parameter            | Description                                                                                                                                                                                                                                                                                                             |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No Parameters        | Starts the SmartEvent Server and the SmartEvent Correlation Unit services.                                                                                                                                                                                                                                              |
| -analyzer            | Starts only the SmartEvent Correlation Unit service.                                                                                                                                                                                                                                                                    |
| -m                   | Starts the service(s) only in the <b>MDS</b> context.                                                                                                                                                                                                                                                                   |
| <IP Address or Name> | Starts the service(s) only in the context of the specified Domain Management Server / Domain Log Server.<br>If you first go to this context with the "mdsenv <IP Address or Name>" command (see <a href="#">"mdsenv" on page 766</a> ), then you do not have to specify the IP Address or Name in the "evstart" syntax. |

# evstop

## Description

On a Multi-Domain Security Management Server, this command:

- Stops the SmartEvent Server and the SmartEvent Correlation Unit services.
- Stops only the SmartEvent Correlation Unit service.
- Can apply only to the **MDS** context.
- Can apply only to the specified Domain Management Server with the enabled SmartEvent Server and SmartEvent Correlation Unit Software Blades.

On a Multi-Domain Log Server, this command:

- Stops the SmartEvent Server and the SmartEvent Correlation Unit services.
- Stops only the SmartEvent Correlation Unit service.
- Can apply only to the **MDS** context.
- Can apply only to the specified Domain Log Server with the enabled SmartEvent Server and SmartEvent Correlation Unit Software Blades.

### Important:

- You can run this command only in the Expert mode.
- Multi-Domain Security Management Server / Multi-Domain Log Server runs this command automatically:
  - When you run the "mdsstop" command (see ["mdsstop" on page 777](#)).
  - During reboot or shutdown.
- Domain Management Server / Domain Log Server runs this command automatically when you run the "mdsstop\_customer" command (see ["mdsstop\\_customer" on page 781](#)).

## Related command

|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No Parameters        | Stops the SmartEvent Server and the SmartEvent Correlation Unit services.                                                                                                                                                                                                                                             |
| -analyzer            | Stops only the SmartEvent Correlation Unit service.                                                                                                                                                                                                                                                                   |
| -m                   | Stops the service(s) only in the <b>MDS</b> context.                                                                                                                                                                                                                                                                  |
| <IP Address or Name> | Stops the service(s) only in the context of the specified Domain Management Server / Domain Log Server.<br>If you first go to this context with the "mdserv <IP Address or Name>" command (see <a href="#">"mdserv" on page 766</a> ), then you do not have to specify the IP Address or Name in the "evstop" syntax. |

# fw

## Description

- Performs various operations on Security or Audit log files.
- Kills the specified Check Point processes.
- Manages the Suspicious Activity Monitoring (SAM) rules.
- Manages the Suspicious Activity Policy editor.

## Syntax

```
fw [-d]
    fetchlogs <options>
    hastat <options>
    kill <options>
    log <options>
    logswitch <options>
    lslogs <options>
    mergefiles <options>
    repairlog <options>
    sam <options>
    sam_policy <options>
```

## Parameters

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                     | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| fetchlogs<br><options> | Fetches the specified Check Point log files - Security (\$FWDIR/log/*.log*) or Audit (\$FWDIR/log/*.adtlog*), from the specified Check Point server.<br>See <a href="#">"fw fetchlogs" on page 268</a> .                                                                                                                                   |
| hastat<br><options>    | Shows information about Check Point servers in High Availability configuration and their states.<br>See <a href="#">"fw hastat" on page 272</a> .                                                                                                                                                                                          |

| Parameter                                          | Description                                                                                                                                                                                                                                                          |

# fw fetchlogs

## Description

Fetches the specified Security log files (\$FWDIR/log/\*.log\*) or Audit log files (\$FWDIR/log/\*.adtlog\*) from the specified Check Point server.

 **Important** - You can run this command in the Expert mode or in Gaia Clish (Gaia gClish on Scalable Platforms).

## Syntax

```
fw [-d] fetchlogs [-f <Name of Log File 1>] [-f <Name of Log File 2>]... [-f <Name of Log File N>] <Target>
```

## Parameters

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                      | <p>Runs the command in debug mode.</p> <p>Use only if you troubleshoot the command itself.</p> <p>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| -f <Name of Log File N> | <p>Specifies the name of the log file to fetch. Need to specify name only.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>■ If you do not specify the log file name explicitly, the command transfers all Security log files (\$FWDIR/log/*.log*) and all Audit log files (\$FWDIR/log/*.adtlog*).</li> <li>■ The specified log file name can include wildcards * and ? (for example, 2017-0?-*.log).<br/>If you enter a wildcard, you must enclose it in double quotes or single quotes.</li> <li>■ You can specify multiple log files in one command.<br/>You must use the -f parameter for each log file name pattern.</li> <li>■ This command also transfers the applicable log pointer files.</li> </ul> |
| <Target>                | <p>Specifies the remote Check Point server, with which this local Check Point server has established SIC trust.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>■ The local and the remote servers must have established SIC trust.</li> <li>■ The local server can be a Security Management Server, a Log Server, a Cluster Member.</li> <li>■ The remote server can be a Security Gateway, a Cluster Member, a Log Server, or a Security Management Server in High Availability deployment.</li> <li>■ You can specify the remote managed server by its main IP address or Object Name as configured in SmartConsole.</li> </ul>                                                                             |

**Notes:**

- This command moves the specified log files from the `$FWDIR/log/` directory on the specified Check Point server.

Meaning, it deletes the specified log files on the specified Check Point server after it copies them successfully.

- This command moves the specified log files to the `$FWDIR/log/` directory on the local Check Point server, on which you run this command.
- This command cannot fetch the *active* log files `$FWDIR/log/fw.log` or `$FWDIR/log/fw.adtlog`.

To fetch these active log files:

1. Perform the log switch on the applicable Check Point server:

See "[fw logswitch](#)" on page 284.

```
fw logswitch [-audit] [-h <IP Address or Hostname>]
```

2. Fetch the rotated log file from the applicable Check Point server:

```
fw fetchlogs -f <Log File Name> <IP Address or Hostname>
```

- This command renames the log files it fetched from the specified Check Point server.

The new log file name is the concatenation of these:

- The Check Point server's name (as configured in SmartConsole).
- Two underscore (\_\_) characters.
- The original log file name

**Example:** `MyGW__2019-06-01_000000.log`

## Example - Fetching log files from a Management Server

```
[Expert@HostName:0]# fw lslogs MyGW
Size Log file name
 23KB 2019-05-16_000000.log
  9KB 2019-05-17_000000.log
 11KB 2019-05-18_000000.log
5796KB 2019-06-01_000000.log
4610KB fw.log
[Expert@HostName:0]#

[Expert@HostName:0]# fw fetchlogs -f 2019-06-01_000000 MyGW
File fetching in process. It may take some time...
File MyGW__2019-06-01_000000.log was fetched successfully
[Expert@HostName:0]#

[Expert@HostName:0]# ls $FWDIR/log/MyGW*
/opt/CPsuite-R82.10/fw1/log/MyGW__2019-06-01_000000.log
/opt/CPsuite-R82.10/fw1/log/MyGW__2019-06-01_000000.logaccount_ptr
/opt/CPsuite-R82.10/fw1/log/MyGW__2019-06-01_000000.loginitial_ptr
/opt/CPsuite-R82.10/fw1/log/MyGW__2019-06-01_000000.logptr
[Expert@HostName:0]#

[Expert@HostName:0]# fw lslogs MyGW
Size Log file name
 23KB 2019-05-16_000000.log
  9KB 2019-05-17_000000.log
 11KB 2019-05-18_000000.log
4610KB fw.log
[Expert@HostName:0]#
```

# fw hastat

## Description

Shows information about Check Point computers in High Availability configuration and their states.

-  **Note** - This command is outdated. On cluster members, run the Gaia Clish command "show cluster state", or the Expert mode command "cphaprob state".
-  **Note** - This command is outdated. On Management Servers, run the ["cpstat" on page 209](#) command.

## Syntax

```
fw hastat [<Target1>] [<Target2>] ... [<TargetN>]
```

## Parameters

| Parameter                               | Description                                                                                                                                                                                                                                                                                            |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <Target1><br><Target2> ...<br><TargetN> | Specifies the Check Point computers to query.<br>If you run this command on the Management Server, you can enter the applicable IP address, or the resolvable HostName of the managed Security Gateway or Cluster Member.<br>If you do not specify the target, the command queries the local computer. |

## Example - Querying the cluster members from the Management Server

```
[Expert@MGMT:0]# fw hastat 192.168.3.52
HOST NUMBER HIGH AVAILABILITY STATE MACHINE STATUS
192.168.3.52 1 active OK
[Expert@MGMT:0]#

[Expert@MGMT:0]# fw hastat 192.168.3.53
HOST NUMBER HIGH AVAILABILITY STATE MACHINE STATUS
192.168.3.53 2 stand-by OK
[Expert@MGMT:0]#

[Expert@MGMT:0]# fw hastat 192.168.3.52 192.168.3.53
HOST NUMBER HIGH AVAILABILITY STATE MACHINE STATUS
192.168.3.52 1 active OK
192.168.3.53 2 stand-by OK
[Expert@MGMT:0]#
```

## Example - Querying the local Cluster Member

```
[Expert@Member1:0]# fw hastat
HOST NUMBER HIGH AVAILABILITY STATE MACHINE STATUS
192.168.3.52 1 active OK
[Expert@Member1:0]#
```

# fw kill

## Description

Kills the specified Check Point processes.

### Important:

- Make sure the killed process is restarted, or restart it manually. See [sk97638](#).
- You can run this command in the Expert mode or in Gaia Clish (Gaia gClish on Scalable Platforms).

## Syntax

```
fw [-d] kill [-t <Signal Number>] <Name of Process>
```

## Parameters

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                 | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.                                                                               |
| -t <Signal Number> | Specifies which signal to send to the Check Point process.<br>For the list of available signals and their numbers, run the <code>kill -l</code> command.<br>For information about the signals, see the manual pages for the <a href="#">kill</a> and <a href="#">signal</a> .<br>If you do not specify the signal explicitly, the command sends Signal 15 (SIGTERM).<br><b>Note</b> - Processes can ignore some signals. |
| <Name of Process>  | Specifies the name of the Check Point process to kill.<br>To see the names of the processes, run the <code>ps auxwf</code> command.                                                                                                                                                                                                                                                                                      |

## Example

```
fw kill fwd
```

# fw log

## Description

Shows the content of Check Point log files - Security (\$FWDIR/log/\*.log) or Audit (\$FWDIR/log/\*.adtlog).

 **Important** - You can run this command in the Expert mode or in Gaia Clish (Gaia gClish on Scalable Platforms).

## Syntax

```
fw log {-h | -help}
```

```
fw [-d] log [-a] [-b "<Start Timestamp>" "<End Timestamp>"] [-c
<Action>] [{-f | -t}] [-g] [-H] [-h <Origin>] [-i] [-k {<Alert
Name> | all}] [-l] [-m {initial | semi | raw}] [-n] [-o] [-p] [-q]
[-S] [-s "<Start Timestamp>"] [-e "<End Timestamp>"] [-u
<Unification Scheme File>] [-w] [-x <Start Entry Number>] [-y <End
Entry Number>] [-z] [-#] [<Log File>]
```

## Parameters

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {-h   -help} | Shows the built-in usage.<br><b>Note</b> - The built-in usage does not show some of the parameters described in this table.                                                                                                                                                                                                                |
| -d           | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| -a           | Shows only Account log entries.                                                                                                                                                                                                                                                                                                            |

| Parameter                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-b "&lt;Start Timestamp&gt;" "&lt;End Timestamp&gt;"</code> | <p>Shows only entries that were logged between the specified start and end times.</p> <ul style="list-style-type: none"> <li>■ The <code>&lt;Start Timestamp&gt;</code> and <code>&lt;End Timestamp&gt;</code> may be a date, a time, or both.</li> <li>■ If date is omitted, then the command assumes the current date.</li> <li>■ Enclose the <code>"&lt;Start Timestamp&gt;"</code> and <code>"&lt;End Timestamp&gt;"</code> in single or double quotes (<code>-b 'XX' 'YY'</code>, or <code>-b "XX" "YY"</code>).</li> <li>■ You cannot use the <code>-b</code> parameter together with the <code>-s</code> or <code>-e</code> parameters.</li> <li>■ See the date and time format below.</li> </ul> |
| <code>-c &lt;Action&gt;</code>                                    | <p>Shows only events with the specified action. | -#                                 | Show confidential logs in clear text.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <Log File>                         | <p>Specifies the log file to read.</p> <p>If you do not specify the log file explicitly, the command opens the <code>\$FWDIR/log/fw.log</code> log file.</p> <p>You can specify a switched log file.</p>                                                                                                                                                                                                                                                                                |

## Date and Time format

| Part of timestamp                                                       | Format                   | Example                   |
|-------------------------------------------------------------------------|--------------------------|---------------------------|
| Date only                                                               | MMM DD, YYYY             | June 11, 2018             |
| Time only<br>Note - In this case, the command assumes the current date. | HH:MM:SS                 | 14:20:00                  |
| Date and Time                                                           | MMM DD, YYYY<br>HH:MM:SS | June 11, 2018<br>14:20:00 |

## Output

Each output line consists of a single log entry, whose fields appear in this format:

**Note** - The fields that show depends on the connection type.

```
HeaderDateHour ContentVersion HighLevelLogKey Uuid SequenceNum
Flags Action Origin IfDir InterfaceName LogId ...
```

This table describes some of the fields.

| Field Header    | Description         | Example                                   |
|-----------------|---------------------|-------------------------------------------|
| HeaderDateHour  | Date and Time       | 12Jun2018 12:56:42                        |
| ContentVersion  | Version             | 5                                         |
| HighLevelLogKey | High Level Log Key  | <max_null>, or empty                      |
| Uuid            | Log UUID            | (0x5b1f99cb, 0x0, 0x3403a8c0, 0xc0000000) |
| SequenceNum     | Log Sequence Number | 1                                         |

| Field Header | Description                                                                                                                                                                                      | Example                                                                                                                                                                                                                                       |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Flags        | Internal flags that specify the "nature" of the log - for example, control, audit, accounting, complementary, and so on                                                                          | 428292                                                                                                                                                                                                                                        |
| Action       | Action performed on this connection                                                                                                                                                              | <ul style="list-style-type: none"> <li>■ accept</li> <li>■ dropreject</li> <li>■ encrypt</li> <li>■ decrypt</li> <li>■ vpnroute</li> <li>■ keyinst</li> <li>■ authorize</li> <li>■ deauthorize</li> <li>■ authcrypt</li> <li>■ ctl</li> </ul> |

| ProductFamily | Name of the Check Point product family that generated this log   | Network                                                                                                                          |

## Examples

### Example 1 - Show all log entries with both the date and the time for each log entry

```
fw log -l
```

### Example 2 - Show all log entries that start after the specified timestamp

```
[Expert@MyGW:0]# fw log -l -s "June 12, 2018 12:33:00"
12Jun2018 12:33:00 5 N/A 1 accept MyGW > N/A LogId: <max_null>; ContextNum: <max_null>; OriginSicName: CN=MyGW,O=MyDomain_
Server.checkpoint.com.s6t98x; fg-1_client_in_rule_name: Default; fg-1_client_out_rule_name: Default; fg-1_server_in_rule_name: Host
Redirect; fg-1_server_out_rule_name: ; ProductName: FG; ProductFamily: Network;

12Jun2018 12:33:39 5 N/A 1 drop MyGW < eth0 LogId: 0; ContextNum: <max_null>; OriginSicName: CN=MyGW,O=MyDomain_
Server.checkpoint.com.s6t98x; inzone: Local; outzone: External; service_id: ftp; src: MyGW; dst: MyFTPServer; proto: tcp; UP_match_
table: TABLE_START; ROW_START: 0; match_id: 2; layer_uuid: 4e26fc30-b345-4c96-b8d7-9db6aa7cdd89; layer_name: MyPolicy Network; rule_
uid: 802020d9-5cdc-4c74-8e92-47e1b0eb72e5; rule_name: ; ROW_END: 0; UP_match_table: TABLE_END; UP_action_table: TABLE_START; ROW_

ProductFamily: Network;
[Expert@MyGW:0]#
```

### Example 5 - Show all log entries with action "drop", show all field headers, and show log flags

```
[Expert@MyGW:0]# fw log -l -q -w -c drop
HeaderDateHour: 12Jun2018 12:33:39; ContentVersion: 5; HighLevelLogKey: <max_null>; LogUid: ; SequenceNum: 1; Flags: 428292; Action:
drop; Origin: MyGW; IfDir: <; InterfaceName: eth0; Alert: ; LogId: 0; ContextNum: <max_null>; OriginSicName: CN=MyGW,O=MyDomain_
Server.checkpoint.com.s6t98x; inzone: Local; outzone: External; service_id: ftp; src: MyGW; dst: MyFTPServer; proto: tcp; UP_match_
table: TABLE_START; ROW_START: 0; match_id: 2; layer_uuid: 4e26fc30-b345-4c96-b8d7-9db6aa7cdd89; layer_name: MyPolicy Network; rule_
uid: 802020d9-5cdc-4c74-8e92-47e1b0eb72e5; rule_name: ; ROW_END: 0; UP_match_table: TABLE_END; UP_action_table: TABLE_START; ROW_
START: 0; action: 0; ROW_END: 0; UP_action_table: TABLE_END; ProductName: VPN-1 & FireWall-1; svc: ftp; sport_svc: 64933;
ProductFamily: Network;
[Expert@MyGW:0]#
```

### Example 6 - Show only log entries from 0 to 10 (counting from the beginning of the log file)

```
[Expert@MyGW:0]# fw log -l -x 0 -y 10
... ..
[Expert@MyGW:0]#
```

# fw logswitch

## Description

Switches the current active log file:

1. Closes the current active log file.
2. Renames the current active log file.
3. Creates a new active log file with the default name.

### Notes:

- By default, this command switches the active Security log file - `$FWDIR/log/fw.log`
- You can specify to switch the active Audit log file - `$FWDIR/log/fw.adtlog`

**Important** You can run this command in the Expert mode or in Gaia Clish (Gaia gClish on Scalable Platforms).

## Syntax

```
fw [-d] logswitch
    [-audit] [<Name of Switched Log>]
    -h <Target> [[+ | -]<Name of Switched Log>]
```

## Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d        | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| -audit    | Specifies to switch the active Audit log file ( <code>\$FWDIR/log/fw.adtlog</code> ).<br>You can use this parameter only on a Management Server.                                                                                                                                                                                           |

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -         | <p>Specifies to <i>transfer</i> the active log from the remote server to the local server.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>■ The command saves the copied active log file in the <code>\$FWDIR/log/</code> directory on the local server and then deletes the switched log file on the remote server.</li> <li>■ If you specify the name of the switched log file, you must write it immediately after this - (minus) parameter.</li> <li>■ The default name of the saved log file is:<br/> <code>&lt;Gateway_Object_Name&gt;__&lt;YYYY-MM-DD_HHMMSS&gt;.log</code><br/> For example, <code>MyGW__2018-03-26_174455.log</code></li> <li>■ If you specify the name of the switched log file, then the name of the saved log file is:<br/> <code>&lt;Gateway_Object_Name&gt;__&lt;Specified_Log_Name&gt;.log</code></li> <li>■ When this command transfers the log file from the remote server, it compresses the file.</li> <li>■ As an alternative, you can use the <a href="#">"fw fetchlogs" on page 268</a> command.</li> </ul> |

## Compression

When this command transfers the log files from the remote server, it compresses the file with the `gzip` command (see RFC 1950 to RFC 1952 for details). The algorithm is a variation of LZ77 method. The compression ratio varies with the content of the log file and is difficult to predict. Binary data are not compressed. Text data, such as user names and URLs, are compressed.

### Example - Switching the active Security log on a Security Management Server or Security Gateway

```
[Expert@MGMT:0]# fw logswitch
Log file has been switched to: 2018-06-13_182359.log
[Expert@MGMT:0]#
```

### Example - Switching the active Audit log on a Security Management Server

```
[Expert@MGMT:0]# fw logswitch -audit
Log file has been switched to: 2018-06-13_185711.adtlog
[Expert@MGMT:0]#
```

**Example - Switching the active Security log on a managed Security Gateway and copying the switched log**

```
[Expert@MGMT:0]# fw logswitch -h MyGW +
Log file has been switched to: 2018-06-13_185451.log
[Expert@MGMT:0]#
[Expert@MGMT:0]# ls $FWDIR/log/*.log
/opt/CPsuite-R82.10/fw1/log/fw.log
/opt/CPsuite-R82.10/fw1/log/MyGW__2018-06-13_185451.log
[Expert@MGMT:0]#

[Expert@MyGW:0]# ls $FWDIR/log/*.log
/opt/CPsuite-R82.10/fw1/log/fw.log
/opt/CPsuite-R82.10/fw1/log/2018-06-13_185451.log
[Expert@MyGW:0]#
```

# fw lslogs

## Description

Shows a list of Security log files (`$FWDIR/log/*.log`) and Audit log files (`$FWDIR/log/*.adtlog`) residing on the local server or a remote server.

 **Important** - You can run this command in the Expert mode or in Gaia Clish (Gaia gClish on Scalable Platforms).

## Syntax

```
fw [-d] lslogs [-f <Name of Log File 1>] [-f <Name of Log File 2>]
... [-f <Name of Log File N>] [-e] [-r] [-s {name | size | stime |
etime}] [<Target>]
```

## Parameters

| Parameter                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-d</code>                          | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p>                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>-f &lt;Name of Log File&gt;</code> | <p>Specifies the name of the log file to show.<br/>Need to specify only the name.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>■ If the log file name is not specified explicitly, the command shows all Security log files (<code>\$FWDIR/log/*.log</code>).</li> <li>■ File names may include <code>*</code> and <code>?</code> as wildcards (for example, <code>2019-0?-*</code>).<br/>If you enter a wildcard, you must enclose it in double quotes or single quotes.</li> <li>■ You can specify multiple log files in one command.<br/>You must use the <code>-f</code> parameter for each log file name pattern:<br/> <pre>-f &lt;Name of Log File 1&gt; -f &lt;Name of Log File 2&gt; ... -f &lt;Name of Log File N&gt;</pre> </li> </ul> |

| Parameter                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-e</code>                               | Shows an extended file list. It includes the following information for each log file: <ul style="list-style-type: none"> <li>■ <code>Size</code> - The total size of the log file and its related pointer files</li> <li>■ <code>Creation Time</code> - The time the log file was created</li> <li>■ <code>Closing Time</code> - The time the log file was closed</li> <li>■ <code>Log File Name</code> - The file name</li> </ul>                                                                                                                                                                                                                              |
| <code>-r</code>                               | Reverses the sort order (descending order).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <code>-s {name   size   stime   etime}</code> | Specifies the sort order of the log files using one of the following sort options: <ul style="list-style-type: none"> <li>■ <code>name</code> - The file name</li> <li>■ <code>size</code> - The file size</li> <li>■ <code>stime</code> - The time the log file was created (this is the default option)</li> <li>■ <code>etime</code> - The time the log file was closed</li> </ul>                                                                                                                                                                                                                                                                           |
| <code>&lt;Target&gt;</code>                   | Specifies the remote Check Point server, with which this local Check Point server has established SIC trust. <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>■ The local and the remote servers must have established SIC trust.</li> <li>■ The local server can be a Security Management Server, a Log Server, a Security Gateway, a Cluster Member.</li> <li>■ The remote server can be a Security Gateway, a Cluster Member, a Log Server, or a Security Management Server in High Availability deployment.</li> <li>■ You can specify the remote managed server by its main IP address or Object Name as configured in SmartConsole.</li> </ul> |

### Example 1 - Default output

```
[Expert@HostName:0]# fw lslogs
  Size Log file name
    9KB 2019-06-14_000000.log
   11KB 2019-06-15_000000.log
    9KB 2019-06-16_000000.log
   10KB 2019-06-17_000000.log
    9KB fw.log
[Expert@HostName:0]#
```

**Example 2 - Showing all log files**

```
[Expert@HostName:0]# fw lslogs -f ""
Size Log file name
9KB fw.adtlog
9KB fw.log
9KB 2019-05-29_000000.adtlog
9KB 2019-05-29_000000.log
9KB 2019-05-20_000000.adtlog
9KB 2019-05-20_000000.log
[Expert@HostName:0]#
```

**Example 3 - Showing only log files specified by the patterns**

```
[Expert@HostName:0]# fw lslogs -f "2019-06-14*" -f '2019-06-15*'
Size Log file name
9KB 2019-06-14_000000.adtlog
9KB 2019-06-14_000000.log
11KB 2019-06-15_000000.adtlog
11KB 2019-06-15_000000.log
[Expert@HostName:0]#
```

**Example 4 - Showing only log files specified by the patterns and their extended information**

```
[Expert@HostName:0]# fw lslogs -f "2019-06-14*" -f '2019-06-15*'
Size Log file name
9KB 2019-06-14_000000.adtlog
9KB 2019-06-14_000000.log

[Expert@MGMT:0]#
```

# fw mergefiles

## Description

Merges several Security log files (`$FWDIR/log/*.log`) into a single log file.

Merges several Audit log files (`$FWDIR/log/*.adtlog`) into a single log file.

### Important:

- Do not merge the *active* Security file `$FWDIR/log/fw.log` with other Security switched log files.  
Switch the active Security file `$FWDIR/log/fw.log` (with the "[fw logswitch](#)" on [page 1177](#) command) and only then merge it with other Security switched log files.
- Do not merge the *active* Audit file `$FWDIR/log/fw.adtlog` with other Audit switched log files.  
Switch the active Audit file `$FWDIR/log/fw.adtlog` (with the "[fw logswitch](#)" on [page 1177](#) command) and only then merge it with other Audit switched log files.
- This command unifies logs entries with the same Unique-ID (UID). If you rotate the current active log file before all the segments of a specific log arrive, this command merges the records with the same Unique ID from two different files, into one fully detailed record.
- If the size of the final merged log file exceeds 2GB, this command creates a list of merged files, where the size of each merged file size is not more than 2GB.  
The user receives this warning:

```
Warning: The size of the files you have chosen to merge
is greater than 2GB. The merge will produce two or more
files.
```

The names of merged files are:

- `<Name of Merged Log File>.log`
- `<Name of Merged Log File>_1.log`
- `<Name of Merged Log File>_2.log`
- ...
- `<Name of Merged Log File>_N.log`

-  **Important** - You can run this command in the Expert mode or in Gaia Clish (Gaia gClish on Scalable Platforms).

## Syntax

```
fw [-d] mergefiles {-h | -help}
```

```
fw [-d] mergefiles [-r] [-s] [-t <Time Conversion File>] <Name of Log File 1> <Name of Log File 2> ... <Name of Log File N> <Name of Merged Log File>
```

## Parameters

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                        | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p>                                                                                                                                                                                                                                                                                                                                                                 |
| {-h   -help}              | Shows the built-in usage.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| -r                        | Removes duplicate entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| -s                        | Sorts the merged file by the <b>Time</b> field in log records.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| -t <Time Conversion File> | <p>Specifies a full path and name of a file that instructs this command how to adjust the times during the merge. This is required if you merge log files from Log Servers configured with different time zones.<br/>The file format is:</p> <pre>&lt;IP Address of Log Server #1&gt; &lt;Signed Date Time #1 in Seconds&gt; &lt;IP Address of Log Server #2&gt; &lt;Signed Date Time #2 in Seconds&gt; ... ..</pre> <p> <b>Notes</b></p> <ul style="list-style-type: none"> <li>■ You must specify the absolute path and the file name.</li> <li>■ The name of the time conversion file cannot exceed 230 characters.</li> </ul> |

| Parameter                                                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <p><i>&lt;Name of Log File 1&gt;</i><br/> <i>... &lt;Name of Log File N&gt;</i></p> | <p>Specifies the log files to merge.</p> <p> <b>Notes:</b></p> <ul style="list-style-type: none"> <li>■ You must specify the absolute path and the name of the input log files.</li> <li>■ The name of the input log file cannot exceed 230 characters.</li> </ul>                                                                                                                                                                                                                                          |
| <p><i>&lt;Name of Merged Log File&gt;</i></p>                                       | <p>Specifies the output merged log file.</p> <p> <b>Notes:</b></p> <ul style="list-style-type: none"> <li>■ The name of the merged log file cannot exceed 230 characters.</li> <li>■ If a file with the specified name already exists, the command stops and asks you to remove the existing file, or to specify another name.</li> <li>■ The size of the merged log file cannot exceed 2 GB. In such scenario, the command creates several merged log files, each not exceeding the size limit.</li> </ul> |

### Example - Merging Security log files

```
[Expert@HostName:0]# ls -l $FWDIR/*.log
-rw-rw-r-- 1 admin root 189497 Sep  7 00:00 2019-09-07_000000.log

# fw repairlog

## Description

Check Point Security log file (\$FWDIR/log/\*.log) and Audit log files (\$FWDIR/log/\*.adtlog) are databases, with special pointer files.

If these log pointer files become corrupted (which causes the inability to read the log file), this command can rebuild them.

| Log File Type | Log File Location    | Log Pointer Files                                                            |
|---------------|----------------------|------------------------------------------------------------------------------|
| Security log  | \$FWDIR/log/*.log    | *.logptr<br>*.logaccount_ptr<br>*.loginitial_ptr<br>*.logLuuidDB             |
| Audit log     | \$FWDIR/log/*.adtlog | *.adtlogptr<br>*.adtlogaccount_ptr<br>*.adtloginitial_ptr<br>*.adtlogLuuidDB |

 **Important** - You can run this command in the Expert mode or in Gaia Clish (Gaia gClish on Scalable Platforms).

## Syntax

```
fw [-d] repairlog [-u] <Name of Log File>
```

## Parameters

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                 | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| -u                 | Specifies to rebuild the unification chains in the log file.                                                                                                                                                                                                                                                                               |
| <Name of Log File> | The name of the log file to repair.                                                                                                                                                                                                                                                                                                        |

## Example - Repairing the Audit log file

```
fw repairlog -u 2019-06-17_000000.adtlog
```

# fw sam

## Description

Manages the Suspicious Activity Monitoring (SAM) rules. You can use the SAM rules to block connections to and from IP addresses without the need to change or reinstall the Security Policy. For more information, see [sk112061](#).

You can create the Suspicious Activity Rules in two ways:

- In SmartConsole from Monitoring Results
- In CLI with the `fw sam` command

## Notes:

- See the "`fw sam_policy`" and "`sam_alert`" commands.
- SAM rules consume some CPU resources on Security Gateway.
  - ★ **Best Practice** - The SAM Policy rules consume some CPU resources on Security Gateway. Set an expiration for rules that gives you time to investigate, but does not affect performance. Keep only the required SAM Policy rules. If you confirm that an activity is risky, edit the Security Policy, educate users, or otherwise handle the risk.
- Logs for enforced SAM rules (configured with the `fw sam` command) are stored in the `$FWDIR/log/sam.dat` file.  
By design, the file is purged when the number of stored entries reaches 100,000.  
This data log file contains the records in one of these formats:
 

|                                                                                                             |
|-------------------------------------------------------------------------------------------------------------|
| <code>&lt;type&gt;,&lt;actions&gt;,&lt;expire&gt;,&lt;ipaddr&gt;</code>                                     |
| <code>&lt;type&gt;,&lt;actions&gt;,&lt;expire&gt;,&lt;src&gt;,&lt;dst&gt;,&lt;dport&gt;,&lt;ip_p&gt;</code> |
- SAM Requests are stored on the Security Gateway in the kernel table `sam_requests`.
- IP Addresses that are blocked by SAM rules, are stored on the Security Gateway in the kernel table `sam_blocked_ips`.

## Note - To configure SAM Server settings for a Security Gateway or Cluster:

1. Connect with SmartConsole to the applicable Security Management Server or Domain Management Server.
2. From the left navigation panel, click **Gateways & Servers**.
3. Open the Security Gateway or Cluster object.
4. From the left tree, click **Other > SAM**.
5. Configure the settings.
6. Click **OK**.
7. Install the Access Control Policy on this Security Gateway or Cluster object.

## Important:

- You can run this command in the Expert mode or in Gaia Clish (Gaia gClish on Scalable Platforms).
- In a Cluster, you must configure all the Cluster Members in the same way.
- On Scalable Platforms, you must connect to the applicable Security Group.
- VSNext mode and Traditional VSX mode do **not** support Suspicious Activity Monitoring (SAM) Rules. See [sk79700](#).

## Syntax

- To add or cancel a SAM rule according to criteria:

```
fw [-d] sam [-v] [-s <SAM Server>] [-S <SIC Name of SAM
Server>] [-f <Security Gateway>] [-t <Timeout>] [-l <Log
Type>] [-C] [-e <key=val>]+ [-r] -{n|i|I|j|J} <Criteria>
```

- To delete all SAM rules:

```
fw [-d] sam [-v] [-s <SAM Server>] [-S <SIC Name of SAM
Server>] [-f <Security Gateway>] -D
```

- To monitor all SAM rules:

```
fw [-d] sam [-v] [-s <SAM Server>] [-S <SIC Name of SAM
Server>] [-f <Security Gateway>] [-r] -M -{i|j|n|b|q} all
```

- To monitor SAM rules according to criteria:

```
fw [-d] sam [-v] [-s <SAM Server>] [-S <SIC Name of SAM
Server>] [-f <Security Gateway>] [-r] -M -{i|j|n|b|q}
<Criteria>
```

## Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d        | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session. |
| -v        | Enables verbose mode.<br>In this mode, the command writes one message to <i>stderr</i> for each Security Gateway, on which the command is enforced. These messages show whether the command was successful or not.                                                                                                                         |

| Parameter                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-s &lt;SAM Server&gt;</code>             | <p>Specifies the IP address (in the X.X.X.X format) or resolvable HostName of the Security Gateway that enforces the command.</p> <p>The default is <code>localhost</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <code>-S &lt;SIC Name of SAM Server&gt;</code> | <p>Specifies the SIC name for the SAM server to be contacted. It is expected that the SAM server has this SIC name, otherwise the connection fails.</p> <p> <b>Notes:</b></p> <ul style="list-style-type: none"> <li>■ If you do not explicitly specify the SIC name, the connection continues without the SIC names comparison.</li> <li>■ For more information about enabling the SIC, refer to the OPSEC API Specification.</li> <li>■ On VSX Gateway, run the <code>fw vsx showncs -vs &lt;VSID&gt;</code> command to show the SIC name for the applicable Virtual System.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <code>-f &lt;Security Gateway&gt;</code>       | <p>Specifies the Security Gateway, on which to enforce the action.</p> <p><code>&lt;Security Gateway&gt;</code> can be one of these:</p> <ul style="list-style-type: none"> <li>■ <b>All</b> - Default. Specifies to enforce the action on all managed Security Gateways, where SAM Server runs.<br/>You can use this syntax only on Security Management Server or Domain Management Server.</li> <li>■ <b>localhost</b> - Specifies to enforce the action on this local Check Point server (on which the <code>fw sam</code> command is executed).<br/>You can use this syntax only on Security Gateway or StandAlone.</li> <li>■ <b>Gateways</b> - Specifies to enforce the action on all objects defined as Security Gateways, on which SAM Server runs.<br/>You can use this syntax only on Security Management Server or Domain Management Server.</li> <li>■ <b>Name of Security Gateway object</b> - Specifies to enforce the action on this specific Security Gateway object.<br/>You can use this syntax only on Security Management Server or Domain Management Server.</li> <li>■ <b>Name of Group object</b> - Specifies to enforce the action on all specific Security Gateways in this Group object.</li> </ul> <p> <b>Notes:</b></p> <ul style="list-style-type: none"> <li>■ You can use this syntax only on Security Management Server or Domain Management Server.</li> <li>■ VSX Gateways and VSX Cluster Members do not support Suspicious Activity Monitoring (SAM) Rules. ### Explanation for the <Criteria> syntax

| Parameter                                      | Description                                                                           |
|------------------------------------------------|---------------------------------------------------------------------------------------|
| <code>src &lt;IP&gt;</code>                    | Matches the Source IP address of the connection.                                      |
| <code>dst &lt;IP&gt;</code>                    | Matches the Destination IP address of the connection.                                 |
| <code>any &lt;IP&gt;</code>                    | Matches either the Source IP address or the Destination IP address of the connection. |
| <code>subsrc &lt;IP&gt; &lt;Netmask&gt;</code> | Matches the Source IP address of the connections according to the netmask.            |
| <code>subdst &lt;IP&gt; &lt;Netmask&gt;</code> | Matches the Destination IP address of the connections according to the netmask.       |

| Parameter                                                                                                                | Description                                                                                                                                                                       |
|--------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>subany &lt;IP&gt; &lt;Netmask&gt;</code>                                                                           | Matches either the Source IP address or Destination IP address of connections according to the netmask.                                                                           |
| <code>srv &lt;Src IP&gt; &lt;Dest IP&gt;<br/>&lt;Port&gt; &lt;Protocol&gt;</code>                                        | Matches the specific Source IP address, Destination IP address, Service (port number) and Protocol.                                                                               |
| <code>subsrv &lt;Src IP&gt; &lt;Netmask&gt;<br/>&lt;Dest IP&gt; &lt;Netmask&gt; &lt;Port&gt;<br/>&lt;Protocol&gt;</code> | Matches the specific Source IP address, Destination IP address, Service (port number) and Protocol.<br>Source and Destination IP addresses are assigned according to the netmask. |
| <code>subsrvs &lt;Src IP&gt; &lt;Src<br/>Netmask&gt; &lt;Dest IP&gt; &lt;Port&gt;<br/>&lt;Protocol&gt;</code>            | Matches the specific Source IP address, source netmask, destination netmask, Service (port number) and Protocol.                                                                  |
| <code>subsrvd &lt;Src IP&gt; &lt;Dest IP&gt;<br/>&lt;Dest Netmask&gt; &lt;Port&gt;<br/>&lt;Protocol&gt;</code>           | Matches specific Source IP address, Destination IP, destination netmask, Service (port number) and Protocol.                                                                      |
| <code>dstsrv &lt;Dest IP&gt; &lt;Service&gt;<br/>&lt;Protocol&gt;</code>                                                 | Matches specific Destination IP address, Service (port number) and Protocol.                                                                                                      |
| <code>subdstsrv &lt;Dest IP&gt;<br/>&lt;Netmask&gt; &lt;Port&gt; &lt;Protocol&gt;</code>                                 | Matches specific Destination IP address, Service (port number) and Protocol.<br>Destination IP address is assigned according to the netmask.                                      |
| <code>srcpr &lt;IP&gt; &lt;Protocol&gt;</code>                                                                           | Matches the Source IP address and protocol.                                                                                                                                       |
| <code>dstpr &lt;IP&gt; &lt;Protocol&gt;</code>                                                                           | Matches the Destination IP address and protocol.                                                                                                                                  |

# fw sam\_policy

## Description

Manages the Suspicious Activity Policy editor that works with these types of rules:

- Suspicious Activity Monitoring (SAM) rules.

See [sk112061: How to create and view Suspicious Activity Monitoring \(SAM\) Rules](#).

- Rate Limiting rules.

See [sk182350 - How to configure Rate Limiting rules for DoS Mitigation](#).

Also, see these commands:

- ["fw sam" on page 295](#)
- ["sam\\_alert" on page 404](#)

### Notes:

- These commands are interchangeable:
  - For IPv4: "fw sam\_policy" and "fw samp".
  - For IPv6: "fw6 sam\_policy" and "fw6 samp".
- You can run these commands in Gaia Clish, or Expert mode.
- Security Gateway stores the SAM Policy rules in the `$FWDIR/database/sam_policy.db` file.
- Security Gateway stores the SAM Policy management settings in the `$FWDIR/database/sam_policy.mng` file.

### Important:

- Configuration you make with these commands, survives reboot.
- You can run this command in the Expert mode or in Gaia Clish (Gaia gClish on Scalable Platforms).
- In a Cluster, you must configure all the Cluster Members in the same way.
- On Scalable Platforms, you must connect to the applicable Security Group.
- VSNext mode and Traditional VSX mode do **not** support Suspicious Activity Monitoring (SAM) Rules. See [sk79700](#).

**Best Practice** - The SAM Policy rules consume some CPU resources on Security Gateway. Set an expiration for rules that gives you time to investigate, but does not affect performance. Keep only the required SAM Policy rules. If you confirm that an activity is risky, edit the Security Policy, educate users, or otherwise handle the risk.

## Syntax for IPv4

```
fw [-d] sam_policy
    add <options>
    batch
    del <options>
    get <options>
```

```
fw [-d] samp
    add <options>
    batch
    del <options>
    get <options>
```

## Syntax for IPv6

```
fw6 [-d] sam_policy
    add <options>
    batch
    del <options>
    get <options>
```

```
fw6 [-d] samp
    add <options>
    batch
    del <options>
    get <options>
```

## Parameters

| Parameter     | Description                                                                                                                                                                                                                                                          |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d            | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> |
| add <options> | <p>Adds one Rate Limiting rule one at a time.<br/>See "<a href="#">fw sam_policy add</a>" on page 306.</p>                                                                                                                                                           |
| batch         | <p>Adds or deletes many Rate Limiting rules at a time.<br/>See "<a href="#">fw sam_policy batch</a>" on page 319.</p>                                                                                                                                                |
| del <options> | <p>Deletes one configured Rate Limiting rule one at a time.<br/>See "<a href="#">fw sam_policy del</a>" on page 321.</p>                                                                                                                                             |
| get <options> | <p>Shows all the configured Rate Limiting rules.<br/>See "<a href="#">fw sam_policy get</a>" on page 324.</p>                                                                                                                                                        |

## fw sam\_policy add

### Description

The "fw sam\_policy add" and "fw6 sam\_policy add" commands:

- Add one Suspicious Activity Monitoring (SAM) rule at a time.
- Add one Rate Limiting rule at a time.

#### Notes:

- These commands are interchangeable:
  - For IPv4: "fw sam\_policy" and "fw samp".
  - For IPv6: "fw6 sam\_policy" and "fw6 samp".
- You can run these commands in Gaia Clish, or Expert mode.
- Security Gateway stores the SAM Policy rules in the \$FWDIR/database/sam\_policy.db file.
- Security Gateway stores the SAM Policy management settings in the \$FWDIR/database/sam\_policy.mng file.

#### Important:

- Configuration you make with these commands, survives reboot.
- You can run this command in the Expert mode or in Gaia Clish (Gaia gClish on Scalable Platforms).
- In a Cluster, you must configure all the Cluster Members in the same way.
- On Scalable Platforms, you must connect to the applicable Security Group.
- VSNext mode and Traditional VSX mode do **not** support Suspicious Activity Monitoring (SAM) Rules. See [sk79700](#).

**Best Practice** - The SAM Policy rules consume some CPU resources on Security Gateway. Set an expiration for rules that gives you time to investigate, but does not affect performance. Keep only the required SAM Policy rules. If you confirm that an activity is risky, edit the Security Policy, educate users, or otherwise handle the risk.

### Syntax to configure a Suspicious Activity Monitoring (SAM) rule for IPv4

```
fw [-d] sam_policy add [-u] -a {d|n|b} [-l {r|a}] [-t <Timeout>]
[-f <Target>] [-n <"Rule Name">] [-c <"Rule Comment">] [-o <"Rule
Originator">] [-z "<Zone>"] ip <IP Filter Arguments>
```

### Syntax to configure a Suspicious Activity Monitoring (SAM) rule for IPv6

```
fw6 [-d] sam_policy add [-u] -a {d|n|b} [-l {r|a}] [-t <Timeout>]
[-f <Target>] [-n <"Rule Name">] [-c <"Rule Comment">] [-o <"Rule
Originator">] [-z "<Zone>"] ip <IP Filter Arguments>
```

## Syntax to configure a Rate Limiting rule for IPv4

```
fw [-d] sam_policy add [-u] -a {d|n|b} [-l {r|a}] [-t <Timeout>]
[-f <Target>] [-n <"Rule Name">] [-c <"Rule Comment">] [-o <"Rule
Originator">] [-z "<Zone>"] quota <Quota Filter Arguments>
```

## Syntax to configure a Rate Limiting rule for IPv6

```
fw6 [-d] sam_policy add [-u] -a {d|n|b} [-l {r|a}] [-t <Timeout>]
[-f <Target>] [-n <"Rule Name">] [-c <"Rule Comment">] [-o <"Rule
Originator">] [-z "<Zone>"] quota <Quota Filter Arguments>
```

## Parameters

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d             | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.                                                                                                                                                                                                                                                |
| -u             | Optional.<br>Specifies that the rule category is User-defined.<br>Default rule category is Auto.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| -a {d   n   b} | Mandatory.<br>Specifies the rule action if the traffic matches the rule conditions: <ul style="list-style-type: none"> <li>■ d - Drop the connection.</li> <li>■ n - Notify (generate a log) about the connection and let it through.</li> <li>■ b - Bypass the connection - let it through without checking it against the policy rules.</li> </ul> <b>Note</b> - Rules with action set to <i>Bypass</i> cannot have a log or limit specification. Bypassed packets and connections do not count towards overall number of packets and connection for limit enforcement of type ratio. |
| -l {r   a}     | Optional.<br>Specifies which type of log to generate for this rule for all traffic that matches: <ul style="list-style-type: none"> <li>■ -r - Generate a regular log</li> <li>■ -a - Generate an alert log</li> </ul>                                                                                                                                                                                                                                                                                                                                                                  |

| Parameter                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -t<br><i>&lt;Timeout&gt;</i>       | Optional.<br>Specifies the time period (in seconds), during which the rule will be enforced.<br>Default timeout is indefinite.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| -f <i>&lt;Target&gt;</i>           | Optional.<br>Specifies the target Security Gateways, on which to enforce the Rate Limiting rule.<br><i>&lt;Target&gt;</i> can be one of these: <ul style="list-style-type: none"> <li>■ <b>all</b> - This is the default option. Specifies that the rule should be enforced on all managed Security Gateways.</li> <li>■ <b>Name of the Security Gateway or Cluster object</b> - Specifies that the rule should be enforced only on this Security Gateway or Cluster object (the object name must be as defined in the SmartConsole).</li> <li>■ <b>Name of the Group object</b> - Specifies that the rule should be enforced on all Security Gateways that are members of this Group object (the object name must be as defined in the SmartConsole).</li> </ul> |
| -n " <i>&lt;Rule Name&gt;</i> "    | Optional.<br>Specifies the name (label) for this rule.<br><b>Notes:</b> <ul style="list-style-type: none"> <li>■ You must enclose this string in double quotes.</li> <li>■ The length of this string is limited to 128 characters.</li> <li>■ Before each space or a backslash character in this string, you must write a backslash (\) character. Example:               <div style="border: 1px solid black; padding: 5px; margin-top: 10px;">                 "This\ is\ a\ rule\ name\ with\ a\ backslash\ \\"               </div> </li> </ul>                                                                                                                                                                                                               |
| -c " <i>&lt;Rule Comment&gt;</i> " | Optional.<br>Specifies the comment for this rule.<br><b>Notes:</b> <ul style="list-style-type: none"> <li>■ You must enclose this string in double quotes.</li> <li>■ The length of this string is limited to 128 characters.</li> <li>■ Before each space or a backslash character in this string, you must write a backslash (\) character. Example:               <div style="border: 1px solid black; padding: 5px; margin-top: 10px;">                 "This\ is\ a\ comment\ with\ a\ backslash\ \\"               </div> </li> </ul>                                                                                                                                                                                                                       |

| Parameter                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-o "&lt;Rule Originator&gt;"</code>   | <p>Optional.<br/>Specifies the name of the originator for this rule.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>■ You must enclose this string in double quotes.</li> <li>■ The length of this string is limited to 128 characters.</li> <li>■ Before each space or a backslash character in this string, you must write a backslash (\) character. Example:</li> </ul> <pre>"Created\ by\ John\ Doe"</pre>                                           |
| <code>-z "&lt;Zone&gt;"</code>              | <p>Optional.<br/>Specifies the name of the Security Zone for this rule.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>■ You must enclose this string in double quotes.</li> <li>■ The length of this string is limited to 128 characters.</li> </ul>                                                                                                                                                                                                     |
| <code>ip &lt;IP Filter Arguments&gt;</code> | <p>Mandatory (use this <code>ip</code> parameter, or the <code>quota</code> parameter).<br/>Configures the <i>Suspicious Activity Monitoring (SAM)</i> rule.<br/>Specifies the IP Filter Arguments for the SAM rule (you must use at least one of these options):</p> <pre>[-C] [-s &lt;Source IP&gt;] [-m &lt;Source Mask&gt;] [-d &lt;Destination IP&gt;] [-M &lt;Destination Mask&gt;] [-p &lt;Port&gt;] [-r &lt;Protocol&gt;]</pre> <p>See the explanations below.</p> |

| Parameter                                                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>quota</code><br><code>&lt;Quota</code><br><code>Filter</code><br><code>Arguments&gt;</code> | <p>Mandatory (use this <code>quota</code> parameter, or the <code>ip</code> parameter).<br/> Configures the <i>Rate Limiting</i> rule.<br/> Specifies the Quota Filter Arguments for the Rate Limiting rule (see the explanations below):</p> <ul style="list-style-type: none"> <li>■ <code>[flush true]</code></li> <li>■ <code>[source-negated {true   false}] source &lt;Source&gt;</code></li> <li>■ <code>[destination-negated {true   false}] destination &lt;Destination&gt;</code></li> <li>■ <code>[service-negated {true   false}] service &lt;Protocol and Port numbers&gt;</code></li> <li>■ <code>[&lt;Limit1 Name&gt; &lt;Limit1 Value&gt;] [&lt;Limit2 Name&gt; &lt;Limit2 Value&gt;] ... [&lt;LimitN Name&gt; &lt;LimitN Value&gt;]</code></li> <li>■ <code>[track &lt;Track&gt;]</code></li> </ul> <p> <b>Important:</b></p> <ul style="list-style-type: none"> <li>■ The Quota rules are not applied immediately to the Security Gateway. They are only registered in the Suspicious Activity Monitoring (SAM) policy database. To apply all the rules from the SAM policy database immediately, add "flush true" in the <code>fw sam_policy add</code> command syntax.</li> <li>■ Explanation:<br/> For new connections rate (and for any rate limiting in general), when a rule's limit is violated, the Security Gateway also drops all packets that match the rule.<br/> The Security Gateway computes new connection rates on a per-second basis.<br/> At the start of the 1-second timer, the Security Gateway allows all packets, including packets for existing connections.<br/> If, at some point, during that 1 second period, there are too many new connections, then the Security Gateway blocks all remaining packets for the remainder of that 1-second interval.<br/> At the start of the next 1-second interval, the counters are reset, and the process starts over - the Security Gateway allows packets to pass again up to the point, where the rule's limit is violated.</li> </ul> |

## Explanation for the *IP Filter Arguments* syntax for Suspicious Activity Monitoring (SAM) rules

| Argument              | Description                                                                                  |
|-----------------------|----------------------------------------------------------------------------------------------|
| -C                    | Specifies that open connections should be closed.                                            |
| -s <Source IP>        | Specifies the Source IP address.                                                             |
| -m <Source Mask>      | Specifies the Source subnet mask (in dotted decimal format - x.y.z.w).                       |
| -d <Destination IP>   | Specifies the Destination IP address.                                                        |
| -M <Destination Mask> | Specifies the Destination subnet mask (in dotted decimal format - x.y.z.w).                  |
| -p <Port>             | Specifies the port number (see <a href="#">IANA Service Name and Port Number Registry</a> ). |
| -r <Protocol>         | Specifies the protocol number (see <a href="#">IANA Protocol Numbers</a> ).                  |

Explanation for the *Quota Filter Arguments* syntax for Rate Limiting rules

| Argument                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Examples

### Example 1 - Rate Limiting rule with a range

```
fw sam_policy add -a d -l r -t 3600 quota service any source range:172.16.7.11-172.16.7.13 new-conn-rate 5 flush true
```

#### Explanations:

- This rule drops packets for all connections (`-a d`) that exceed the quota set by this rule, including packets for existing connections.
- This rule logs packets (`-l r`) that exceed the quota set by this rule.
- This rule will expire in 3600 seconds (`-t 3600`).
- This rule limits the rate of creation of new connections to 5 connections per second (`new-conn-rate 5`) for any traffic (`service any`) from the source IP addresses in the range 172.16.7.11 - 172.16.7.13 (`source range:172.16.7.11-172.16.7.13`).

**Note** - The limit of the total number of log entries per second is configured with the *fwaccel dos config set -n <rate>* command.

- This rule will be compiled and loaded on the SecureXL, together with other rules in the Suspicious Activity Monitoring (SAM) policy database immediately, because this rule includes the "flush true" parameter.

**Example 2 - Rate Limiting rule with a service specification**

```
fw sam_policy add -a n -l r quota service 1,50-51,6/443,17/53 service-negated true source cc:QQ byte-rate 0
```

**Explanations:**

- This rule logs and lets through all packets (`-a n`) that exceed the quota set by this rule.
- This rule does not expire (the `timeout` parameter is not specified). To cancel it, you must delete it explicitly.
- This rule applies to all packets except (`service-negated true`) the packets with IP protocol number 1, 50-51, 6 port 443 and 17 port 53 (`service 1,50-51,6/443,17/53`).
- This rule applies to all packets from source IP addresses that are assigned to the country with specified country code (`cc:QQ`).
- This rule does not let any traffic through (`byte-rate 0`) except the packets with IP protocol number 1, 50-51, 6 port 443 and 17 port 53.
- This rule will not be compiled and installed on the SecureXL immediately, because it does not include the "`flush true`" parameter.

**Example 3 - Rate Limiting rule with ASN**

```
fw sam_policy -a d quota source asn:AS64500,cidr:[::FFFF:C0A8:1100]/120 service any pkt-rate 0
```

**Explanations:**

- This rule drops (`-a d`) all packets that match this rule.
- This rule does not expire (the `timeout` parameter is not specified). To cancel it, you must delete it explicitly.
- This rule applies to packets from the Autonomous System number 64500 (`asn:AS64500`).
- This rule applies to packets from source IPv6 addresses FFFF:C0A8:1100/120 (`cidr:[::FFFF:C0A8:1100]/120`).
- This rule applies to all traffic (`service any`).
- This rule does not let any traffic through (`pkt-rate 0`).
- This rule will not be compiled and installed on the SecureXL immediately, because it does not include the "`flush true`" parameter.

**Example 4 - Rate Limiting rule with an Allow List**

```
fw sam_policy add -a b quota source range:172.16.8.17-172.16.9.121 service 6/80
```

**Explanations:**

- This rule bypasses (`-a b`) all packets that match this rule.

**Note** - The Access Control Policy and other types of security policy rules still apply.

- This rule does not expire (the `timeout` parameter is not specified). To cancel it, you must delete it explicitly.
- This rule applies to packets from the source IP addresses in the range 172.16.8.17 - 172.16.9.121 (`range:172.16.8.17-172.16.9.121`).
- This rule applies to packets sent to TCP port 80 (`service 6/80`).
- This rule will not be compiled and installed on the SecureXL immediately, because it does not include the "`flush true`" parameter.

### Example 5 - Rate Limiting rule with tracking

```
fw sam_policy add -a d quota service any source-negated true source cc:QQ concurrent-conns-ratio 655 track source
```

#### Explanations:

- This rule drops (`-a d`) all packets that match this rule.
- This rule does not log any packets (the `-l r` parameter is not specified).
- This rule does not expire (the `timeout` parameter is not specified). To cancel it, you must delete it explicitly.
- This rule applies to all traffic (`service any`).
- This rule applies to all sources except (`source-negated true`) the source IP addresses that are assigned to the country with specified country code (`cc:QQ`).
- This rule limits the maximum number of concurrent active connections to  $655/65536 \approx 1\%$  (`concurrent-conns-ratio 655`) for any traffic (`service any`) except (`source-negated true`) the connections from the source IP addresses that are assigned to the country with specified country code (`cc:QQ`).
- This rule counts connections, packets, and bytes for traffic only from sources that match this rule, and not cumulatively for this rule.
- This rule will not be compiled and installed on the SecureXL immediately, because it does not include the "`flush true`" parameter.

## fw sam\_policy batch

### Description

The "fw sam\_policy batch" and "fw6 sam\_policy batch" commands:

- Add and delete many Suspicious Activity Monitoring (SAM) rules at a time.
- Add and delete many Rate Limiting rules at a time.

#### Notes:

- These commands are interchangeable:
  - For IPv4: "fw sam\_policy" and "fw samp".
  - For IPv6: "fw6 sam\_policy" and "fw6 samp".
- You can run these commands in Gaia Clish, or Expert mode.
- Security Gateway stores the SAM Policy rules in the `$FWDIR/database/sam_policy.db` file.
- Security Gateway stores the SAM Policy management settings in the `$FWDIR/database/sam_policy.mng` file.

#### Important:

- Configuration you make with these commands, survives reboot.
- You can run this command in the Expert mode or in Gaia Clish (Gaia gClish on Scalable Platforms).
- In a Cluster, you must configure all the Cluster Members in the same way.
- On Scalable Platforms, you must connect to the applicable Security Group.
- VSNext mode and Traditional VSX mode do **not** support Suspicious Activity Monitoring (SAM) Rules. See [sk79700](#).

**Best Practice** - The SAM Policy rules consume some CPU resources on Security Gateway. Set an expiration for rules that gives you time to investigate, but does not affect performance. Keep only the required SAM Policy rules. If you confirm that an activity is risky, edit the Security Policy, educate users, or otherwise handle the risk.

### Procedure

#### 1. Start the batch mode

- For IPv4, run:

```
fw sam_policy batch << EOF
```

- For IPv6, run:

```
fw6 sam_policy batch << EOF
```

## 2. Enter the applicable commands

- Enter one "add" or "del" command on each line, on as many lines as necessary.

Start each line with only "add" or "del" parameter (not with "fw samp").

- Use the same set of parameters and values as described in these commands:
  - fw sam\_policy add
  - fw sam\_policy del
- Terminate each line with a Return (ASCII 10 - Line Feed) character (press Enter).

## 3. End the batch mode

Type EOF and press Enter.

### Example of a Rate Limiting rule for IPv4

```
[Expert@HostName]# fw samp batch <<EOF
add -a d -l r -t 3600 -c "Limit\ conn\ rate\ to\ 5\ conn/sec from\ these\ sources" quota service
any source range:172.16.7.13-172.16.7.13 new-conn-rate 5

del <501f6ef0,00000000,cb38a8c0,0a0afffe>

add -a b quota source range:172.16.8.17-172.16.9.121 service 6/80

EOF
[Expert@HostName]#
```

## fw sam\_policy del

### Description

The "fw sam\_policy del" and "fw6 sam\_policy del" commands:

- Delete one configured Suspicious Activity Monitoring (SAM) rule at a time.
- Delete one configured Rate Limiting rule at a time.

#### Notes:

- These commands are interchangeable:
  - For IPv4: "fw sam\_policy" and "fw samp".
  - For IPv6: "fw6 sam\_policy" and "fw6 samp".
- You can run these commands in Gaia Clish, or Expert mode.
- Security Gateway stores the SAM Policy rules in the `$FWDIR/database/sam_policy.db` file.
- Security Gateway stores the SAM Policy management settings in the `$FWDIR/database/sam_policy.mng` file.

#### Important:

- Configuration you make with these commands, survives reboot.
- You can run this command in the Expert mode or in Gaia Clish (Gaia gClish on Scalable Platforms).
- In a Cluster, you must configure all the Cluster Members in the same way.
- On Scalable Platforms, you must connect to the applicable Security Group.
- VSNext mode and Traditional VSX mode do **not** support Suspicious Activity Monitoring (SAM) Rules. See [sk79700](#).

**Best Practice** - The SAM Policy rules consume some CPU resources on Security Gateway. Set an expiration for rules that gives you time to investigate, but does not affect performance. Keep only the required SAM Policy rules. If you confirm that an activity is risky, edit the Security Policy, educate users, or otherwise handle the risk.

### Syntax for IPv4

```
fw [-d] sam_policy del '<Rule UID>'
```

### Syntax for IPv6

```
fw6 [-d] sam_policy del '<Rule UID>'
```

## Parameters

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                         |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d           | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.            |
| '<Rule UID>' | Specifies the UID of the rule you wish to delete.<br> <b>Important:</b> <ul style="list-style-type: none"> <li>▪ The quote marks and angle brackets ('&lt;...&gt;') are mandatory.</li> <li>▪ To see the Rule UID, run the "fw sam_policy get" command.</li> </ul> |

## Procedure

### 1. List all the existing rules in the Suspicious Activity Monitoring policy database

List all the existing rules in the Suspicious Activity Monitoring policy database.

- For IPv4, run:

```
fw sam_policy get
```

- For IPv6, run:

```
fw6 sam_policy get
```

The rules show in this format:

```
operation=add uid=<Value1,Value2,Value3,Value4> target=...
timeout=... action=... log= ... name= ... comment=...
originator= ... src_ip_addr=... req_tpe=...
```

Example for IPv4:

```
operation=add uid=<5ac3965f,00000000,3403a8c0,0000264a>
target=all timeout=300 action=notify log=log name=Test\ Rule
comment=Notify\ about\ traffic\ from\ 1.1.1.1
originator=John\ Doe src_ip_addr=1.1.1.1 req_tpe=ip
```

## 2. Delete a rule from the list by its UID

- For IPv4, run:

```
fw [-d] sam_policy del '<Rule UID>'
```

- For IPv6, run:

```
fw6 [-d] sam_policy del '<Rule UID>'
```

Example for IPv4:

```
fw samp del '<5ac3965f,00000000,3403a8c0,0000264a>'
```

## 3. Add the flush-only rule

- For IPv4, run:

```
fw samp add -t 2 quota flush true
```

- For IPv6, run:

```
fw6 samp add -t 2 quota flush true
```

Explanation:

The "fw samp del" and "fw6 samp del" commands only remove a rule from the persistent database. The Security Gateway continues to enforce the deleted rule until the next time you compiled and load a policy. To force the rule deletion immediately, you must enter a flush-only rule right after the "fw samp del" and "fw6 samp del" command. This flush-only rule immediately deletes the rule you specified in the previous step, and times out in 2 seconds.

- ★ **Best Practice** - Specify a short timeout period for the flush-only rules. This prevents accumulation of rules that are obsolete in the database.

## fw sam\_policy get

### Description

The "fw sam\_policy get" and "fw6 sam\_policy get" commands:

- Show all the configured Suspicious Activity Monitoring (SAM) rules.
- Show all the configured Rate Limiting rules.

### Notes:

- These commands are interchangeable:
  - For IPv4: "fw sam\_policy" and "fw samp".
  - For IPv6: "fw6 sam\_policy" and "fw6 samp".
- You can run these commands in Gaia Clish, or Expert mode.
- Security Gateway stores the SAM Policy rules in the `$FWDIR/database/sam_policy.db` file.
- Security Gateway stores the SAM Policy management settings in the `$FWDIR/database/sam_policy.mng` file.

### Important:

- Configuration you make with these commands, survives reboot.
- You can run this command in the Expert mode or in Gaia Clish (Gaia gClish on Scalable Platforms).
- In a Cluster, you must configure all the Cluster Members in the same way.
- On Scalable Platforms, you must connect to the applicable Security Group.
- VSNext mode and Traditional VSX mode do **not** support Suspicious Activity Monitoring (SAM) Rules. See [sk79700](#).

- ★ **Best Practice** - The SAM Policy rules consume some CPU resources on Security Gateway. Set an expiration for rules that gives you time to investigate, but does not affect performance. Keep only the required SAM Policy rules. If you confirm that an activity is risky, edit the Security Policy, educate users, or otherwise handle the risk.

### Syntax for IPv4

```
fw [-d] sam_policy get [-l] [-u '<Rule UID>'] [-k '<Key>' -t
<Type> [{-v '<Value>'}] [-n]]
```

### Syntax for IPv6

```
fw6 [-d] sam_policy get [-l] [-u '<Rule UID>'] [-k '<Key>' -t
<Type> [{-v '<Value>'}] [-n]]
```

## Parameters

**Note** - All these parameters are optional.

| Parameter       | Description                                                                                                                                                                                                                                                                                                                               |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d              | <p>Runs the command in debug mode.</p> <p>Use only if you troubleshoot the command itself.</p> <p>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p>                                                                   |
| -l              | <p>Controls how to print the rules:</p> <ul style="list-style-type: none"> <li>■ In the default format (without "-l"), the output shows each rule on a separate line.</li> <li>■ In the list format (with "-l"), the output shows each parameter of a rule on a separate line.</li> <li>■ See the "fw sam_policy add" command.</li> </ul> |
| -u '<Rule UID>' | <p>Prints the rule specified by its Rule UID or its zero-based rule index.</p> <p>The quote marks and angle brackets ('&lt;...&gt;') are mandatory.</p>                                                                                                                                                                                   |
| -k '<Key>'      | <p>Prints the rules with the specified predicate key.</p> <p>The quote marks are mandatory.</p>                                                                                                                                                                                                                                           |
| -t <Type>       | <p>Prints the rules with the specified predicate type.</p> <p>For Rate Limiting rules, you must always use "-t in".</p>                                                                                                                                                                                                                   |
| +{-v '<Value>'} | <p>Prints the rules with the specified predicate values.</p> <p>The quote marks are mandatory.</p>                                                                                                                                                                                                                                        |
| -n              | <p>Negates the condition specified by these predicate parameters:</p> <ul style="list-style-type: none"> <li>■ -k</li> <li>■ -t</li> <li>■ +-v</li> </ul>                                                                                                                                                                                 |

## Examples

### Example 1 - Output in the default format

```
[Expert@HostName:0]# fw samp get

operation=add uid=<5ac3965f,00000000,3403a8c0,0000264a> target=all timeout=300 action=notify
log=log name=Test\ Rule comment=Notify\ about\ traffic\ from\ 1.1.1.1 originator=John\ Doe
src_ip_addr=1.1.1.1 req_tpe=ip
```

**Example 2 - Output in the list format**

```
[Expert@HostName:0]# fw samp get -l
uid
<5ac3965f,00000000,3403a8c0,0000264a>
target
all
timeout
2147483647
action
notify
log
log
name
Test\ Rule
comment
Notify\ about\ traffic\ from\ 1.1.1.1
originator
John\ Doe
src_ip_addr
1.1.1.1
req_type
ip
```

**Example 3 - Printing a rule by its Rule UID**

```
[Expert@HostName:0]# fw samp get -u '<5ac3965f,00000000,3403a8c0,0000264a>'
0
operation=add uid=<5ac3965f,00000000,3403a8c0,0000264a> target=all timeout=300 action=notify
log=log name=Test\ Rule comment=Notify\ about\ traffic\ from\ 1.1.1.1 originator=John\ Doe
src_ip_addr=1.1.1.1 req_tpe=ip
```

#### Example 4 - Printing rules that match the specified filters

```

[Expert@HostName:0]# fw samp get
no corresponding SAM policy requests
[Expert@HostName:0]#
[Expert@HostName:0]# fw samp add -a d -l r -t 3600 quota service any source
range:172.16.7.11-172.16.7.13 new-conn-rate 5 flush true
[Expert@HostName:0]#
[Expert@HostName:0]# fw samp add -a n -l r quota service 1,50-51,6/443,17/53 service-negated

```

# fwm

## Description

Performs various management operations and shows various management information.

 **Notes:**

- For debug instructions, see the description of the `fwm` process in [sk97638](#).
- On a Multi-Domain Server, you must run these commands in the context of the applicable Domain Management Server.

## Syntax

```
fwm [-d]
    dbload <options>
    exportcert <options>
    fetchfile <options>
    fingerprint <options>
    getpcap <options>
    ikecrypt <options>
    load [<options>]
    logexport <options>
    mds <options>
    printcert <options>
    sic_reset
    snmp_trap <options>
    unload [<options>]
    ver [<options>]
    verify <options>
```

## Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                               |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d        | <p>Runs the command in debug mode.</p> <p>Use only if you troubleshoot the command itself.</p> <p> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> |

| Parameter                                                | Description                                                                                                                                                                                            |
|----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>dbload</code><br><code>&lt;options&gt;</code>      | Downloads the user database and network objects information to the specified targets<br>See <a href="#">"fwm dbload" on page 333</a> .                                                                 |
| <code>exportcert</code><br><code>&lt;options&gt;</code>  | Export a SIC certificate of the specified object to file.<br>See <a href="#">"fwm exportcert" on page 334</a> .                                                                                        |
| <code>fetchfile</code><br><code>&lt;options&gt;</code>   | Fetches a specified OPSEC configuration file from the specified source server.<br>See <a href="#">"fwm fetchfile" on page 335</a> .                                                                    |
| <code>fingerprint</code><br><code>&lt;options&gt;</code> | Shows the Check Point fingerprint.<br>See <a href="#">"fwm fingerprint" on page 337</a> .                                                                                                              |
| <code>getpcap</code><br><code>&lt;options&gt;</code>     | Fetches the IPS packet capture data from the specified Security Gateway.<br>See <a href="#">"fwm getpcap" on page 339</a> .                                                                            |
| <code>ikecrypt</code><br><code>&lt;options&gt;</code>    | Encrypts a secret with a key.<br>See <a href="#">"fwm ikecrypt" on page 341</a> .                                                                                                                      |
| <code>load</code><br><code>&lt;options&gt;</code>        | This command is obsolete for R80 and higher.<br>Use the <a href="#">"mgmt_cli" on page 386</a> command to load a policy to a managed Security Gateway.<br>See <a href="#">"fwm load" on page 342</a> . |
| <code>logexport</code><br><code>&lt;options&gt;</code>   | Exports a Security log file ( <code>\$FWDIR/log/*.log</code> ) or Audit log file ( <code>\$FWDIR/log/*.adtlog</code> ) to an ASCII file.<br>See <a href="#">"fwm logexport" on page 343</a> .          |
| <code>mds &lt;options&gt;</code>                         | Shows information and performs various operations on Multi-Domain Server.<br>See <a href="#">"fwm mds" on page 348</a> .                                                                               |
| <code>printcert</code><br><code>&lt;options&gt;</code>   | Shows a SIC certificate's details.<br>See <a href="#">"fwm printcert" on page 350</a> .                                                                                                                |
| <code>sic_reset</code>                                   | Resets SIC on the Management Server.<br>See <a href="#">"fwm sic_reset" on page 356</a> .                                                                                                              |
| <code>snmp_trap</code><br><code>&lt;options&gt;</code>   | Sends an SNMP Trap to the specified host.<br>See <a href="#">"fwm snmp_trap" on page 357</a> .                                                                                                         |
| <code>unload</code><br><code>&lt;options&gt;</code>      | Unloads the policy from the specified managed Security Gateways.<br>See <a href="#">"fwm unload" on page 360</a> .                                                                                     |

| Parameter                               | Description                                                                                                                                                                  |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ver &lt;options&gt;</code>        | Shows the Check Point version of the Management Server.<br>See <a href="#">"fwm ver" on page 364</a> .                                                                       |
| <code>verify<br/>&lt;options&gt;</code> | This command is obsolete for R80 and higher.<br>Use the <a href="#">"mgmt_cli" on page 386</a> command to verify a policy.<br>See <a href="#">"fwm verify" on page 365</a> . |

# fwm dbload

## Description

Copies the user database and network objects information to specified managed servers with one or more **Management** Software Blades enabled.

**Important** - This command is obsolete for R80 and higher.

Use the API command `"install-database"` to install the database on the applicable servers.

See the [Check Point Management API Reference](#) (at the top, select the correct version) .

# fwm exportcert

## Description

Export a SIC certificate of the specified managed object to a file.

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
fwm [-d] exportcert -obj <Name of Object> -cert <Name of CA> -file  
<Output File> [-withroot] [-pem]
```

## Parameters

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                 |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d               | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br><b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.<br>For complete debug instructions, see the description of the <code>fwm</code> process in <a href="#">sk97638</a> . |
| <Name of Object> | Specifies the name of the managed object, whose certificate you wish to export.                                                                                                                                                                                                                                                                                             |
| <Name of CA>     | Specifies the name of Certificate Authority, whose certificate you wish to export.                                                                                                                                                                                                                                                                                          |
| <Output File>    | Specifies the name of the output file.                                                                                                                                                                                                                                                                                                                                      |
| -withroot        | Exports the certificate's root in addition to the certificate's content.                                                                                                                                                                                                                                                                                                    |
| -pem             | Save the exported information in a text file.<br>Default is to save in a binary file.                                                                                                                                                                                                                                                                                       |

# fwm fetchfile

## Description

Fetches a specified OPSEC configuration file from the specified source server.

This command supports only the `fwopsec.conf` or `fwopsec.v4x` files.

 **Note:**  
On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

`mdsenv <IP Address or Name of Domain Management Server>`

## Syntax

```
fwm [-d] fetchfile -r <File> [-d <Local Path>] <Source>
```

## Parameters

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d              | <p>Runs the command in debug mode.</p> <p>Use only if you troubleshoot the command itself.</p> <p> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> |
| -r <File>       | <p>Specifies the relative <code>fw1</code> directory.</p> <p>This command supports only these files:</p> <ul style="list-style-type: none"><li>■ <code>conf/fwopsec.conf</code></li><li>■ <code>conf/fwopsec.v4x</code></li></ul>                                                                                                                         |
| -d <Local Path> | <p>Specifies the local directory to save the fetched file.</p>                                                                                                                                                                                                                                                                                            |
| <Source>        | <p>Specifies the managed remote source server, from which to fetch the file.</p> <p> <b>Note</b> - The local and the remote source servers must have established SIC trust.</p>                                                                                        |

## Example

```
[Expert@MGMT:0]# fwm fetchfile -r "conf/fwopsec.conf" -d /tmp 192.168.3.52
Fetching conf/fwopsec.conf from 192.168.3.52...
Done
[Expert@MGMT:0]#
```

# fwm fingerprint

## Description

Shows the Check Point fingerprint.

 **Note:**  
On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

mdsensv <IP Address or Name of Domain Management Server>

## Syntax

```
fwm [-d] fingerprint [-d]
    <IP address of Target> <SSL Port>
    localhost <SSL Port>
```

## Parameters

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                     | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> <p>The debug options are:</p> <ul style="list-style-type: none"><li>■ <code>fwm -d</code><br/>Runs the complete debug of all <code>fwm</code> actions.<br/>For complete debug instructions, see the description of the <code>fwm</code> process in <a href="#">sk97638</a>.</li><li>■ <code>fingerprint -d</code><br/>Runs the debug only for the fingerprint actions.</li></ul> |
| <IP address of Target> | Specifies the IP address of a remote managed server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <SSL Port>             | Specifies the SSL port number.<br>The default is 443.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Example 1 - Showing the fingerprint on the local Management Server

```
[Expert@MGMT:0]# fwm fingerprint localhost 443
#DN OID.1.2.840.113549.1.9.2=An optional company name,Email=Email
Address,CN=192.168.3.51,L=Locality Name (eg\, city)
#FINGER 11:A6:F7:1F:B9:F5:15:BC:F9:7B:5F:DC:28:FC:33:C5
##
[Expert@MGMT:0]#
```

## Example 2 - Showing the fingerprint from a managed Security Gateway

```
[Expert@MGMT:0]# fwm fingerprint 192.168.3.52 443
#DN OID.1.2.840.113549.1.9.2=An optional company name,Email=Email
Address,CN=192.168.3.52,L=Locality Name (eg\, city)
#FINGER 5C:8E:4D:B9:B4:3A:58:F3:79:18:F1:70:99:8B:5F:2B
##
[Expert@MGMT:0]#
```

# fwm getpcap

## Description

Fetches the IPS packet capture data from the specified Security Gateway.

This command only works with IPS packet captures stored on the Security Gateway in the `$FWDIR/log/captures_repository/` directory.

This command does not work with other Software Blades, such as Anti-Bot and Anti-Virus that store packet captures in the `$FWDIR/log/blob/` directory on the Security Gateway.

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsend <IP Address or Name of Domain Management Server>
```

## Syntax

```
fwm [-d] getpcap -g <Security Gateway> -u '{<Capture UID>}' -p <Local Path>
```

## Parameters

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                       | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br><b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.<br>For complete debug instructions, see the description of the <code>fwm</code> process in <a href="#">sk97638</a> . |
| -g<br><Security Gateway> | Specifies the main IP address or Name of Security Gateway object as configured in SmartConsole.                                                                                                                                                                                                                                                                             |
| -u '<br>{<Capture UID>}' | Specifies the Unique ID of the packet capture file.<br>To see the Unique ID of the packet capture file, open the applicable log file in <b>SmartConsole &gt; Logs &amp; Events &gt; Logs</b> .                                                                                                                                                                              |
| -p <Local Path>          | Specifies the local path to save the specified packet capture file.<br>If you do not specify the local directory explicitly, the command saves the packet capture file in the current working directory.                                                                                                                                                                    |

## Example

```
[Expert@MGMT:0]# fwm getpcap -g 192.168.162.1 -u '{0x4d79dc02,0x10000,0x220da8c0,0xffffffff}'  
/var/log/  
[Expert@MGMT:0]#
```

# fwm ikecrypt

## Description

Encrypts the password of an Endpoint VPN Client user using IKE. The resulting string must then be stored in the LDAP database.

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
fwm [-d] ikecrypt <Key> <Password>
```

## Parameters

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d         | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.<br>For complete debug instructions, see the description of the <code>fwm</code> process in <a href="#">sk97638</a> . |
| <Key>      | Specifies the IKE Key as defined in the <b>LDAP Account Unit</b> properties window on the <b>Encryption</b> tab.                                                                                                                                                                                                                                                                                                                                                |
| <Password> | Specifies the password for the Endpoint VPN Client user.                                                                                                                                                                                                                                                                                                                                                                                                        |

## Example

```
[Expert@MGMT:0]# fwm ikecrypt MySecretKey MyPassword
OUQJHiNHCj6HJGH8ntnKQ7tg
[Expert@MGMT:0]#
```

# fwm load

## Description

Loads a policy on a managed Security Gateway.

**Important** - This command is obsolete for R80 and higher.

Use the API command "install-policy" to load a policy on a managed Security Gateway.

See the [Check Point Management API Reference](#) (at the top, select the correct version) .

# fwm logexport

## Description

Exports a Security log file (\$FWDIR/log/\*.log) or Audit log file (\$FWDIR/log/\*.adtlog) to an ASCII file.

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
fwm logexport -h
```

```
fwm [-d] logexport [{-d <Delimiter> | -s}] [-t <Table Delimiter>]
[-i <Input File>] [-o <Output File>] [{-f | -e}] [-x <Start Entry
Number>] [-y <End Entry Number>] [-z] [-n] [-p] [-a] [-u
<Unification Scheme File>] [-m {initial | semi | raw}]
```

## Parameters

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -h                        | Shows the built-in usage.                                                                                                                                                                                                                                                                                                                                                                   |
| -d                        | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> <p>For complete debug instructions, see the description of the <code>fwm</code> process in <a href="#">sk97638</a>.</p> |
| -d<br><Delimiter><br>  -s | <p>Specifies the output delimiter between fields of log entries:</p> <ul style="list-style-type: none"> <li>▪ -d &lt;Delimiter&gt; - Uses the specified delimiter.</li> <li>▪ -s - Uses the ASCII character #255 (non-breaking space) as the delimiter.</li> </ul> <p><b>Note</b> - If you do not specify the delimiter explicitly, the default is a semicolon (;).</p>                     |

| Parameter                                  | Description                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-t &lt;Table Delimiter&gt;</code>    | <p>Specifies the output delimiter inside table field.<br/>Table field would look like:<br/><i>ROWx:COL0,ROWx:COL 1,ROWx:COL2</i>, and so on</p> <p><b>Note</b> - If you do not specify the table delimiter explicitly, the default is a comma (,).</p>                                                                                                                     |
| <code>-i &lt;Input File&gt;</code>         | <p>Specifies the name of the input log file.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>■ This command supports only Security log file (\$FWDIR/log/*.log) and Audit log file (\$FWDIR/log/*.adtlog)</li> <li>■ If you do not specify the input log file explicitly, the command processes the active Security log file \$FWDIR/log/fw.log</li> </ul> |
| <code>-o &lt;Output File&gt;</code>        | <p>Specifies the name of the output file.</p> <p><b>Note</b> - If you do not specify the output log file explicitly, the command prints its output on the screen.</p>                                                                                                                                                                                                      |
| <code>-f</code>                            | <p>After reaching the end of the currently opened log file, specifies to continue to monitor the log file indefinitely and export the new entries as well.</p> <p><b>Note</b> - Applies only to the <i>active</i> log file: \$FWDIR/log/fw.log or \$FWDIR/log/fw.adtlog</p>                                                                                                |

| -a                                 | Exports only Account log entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| -u<br><Unification<br>Scheme File> | Specifies the path and name of the log unification scheme file.<br>The default log unification scheme file is:<br>\$FWDIR/conf/log_unification_scheme.C                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| -m {initial<br>  semi  <br>raw}    | Specifies the log unification mode: <ul style="list-style-type: none"> <li>■ <b>initial</b> - Complete unification of log entries. The command exports one unified log entry for each ID. This is the default. If you also specify the "-f" parameter, then the output does not export any updates, but exports only entries that relate to the start of new connections. To export updates as well, use the "semi" parameter.</li> <li>■ <b>semi</b> - Step-by-step unification of log entries. For each log entry, exports entry that unifies this entry with all previously encountered entries with the same ID.</li> <li>■ <b>raw</b> - No log unification. Exports all log entries.</li> </ul> |

The output of the `fwm logexport` command appears in tabular format.

The first row lists the names of all log fields included in the log entries.

Each of the next rows consists of a single log entry, whose fields are sorted in the same order as the first row.

If a log entry has no information in a specific field, this field remains empty (as indicated by two successive semi-colons "; ;").

You can control which log fields appear in the output of the command output:

| Step | Instructions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

[Expert@MGMT:0]#
```

# fwm mds

## Description

- Shows the Check Point version of the Multi-Domain Server.
- Rebuilds status tree for Global VPN Communities.

 **Note** - On a Multi-Domain Server, you can run this command:

- In the context of the MDS:

```
mdsenv
```

- In the context of a Domain Management Server:

```
mdsenv <IP Address or Name of Domain  
Management Server>
```

## Syntax

```
fwm [-d] mds  
    ver  
    rebuild_global_communities_status {all | missing}
```

## Parameters

| Parameter                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                                | <p>Runs the command in debug mode.</p> <p>Use only if you troubleshoot the command itself.</p> <p> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> <p>For complete debug instructions, see the description of the <code>fwm</code> process in <a href="#">sk97638</a>.</p> |
| ver                               | <p>Shows the Check Point version of the Multi-Domain Server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                  |
| rebuild_global_communities_status | <p>Rebuilds status tree for Global VPN Communities:</p> <ul style="list-style-type: none"><li>▪ <code>all</code> - Rebuilds status tree for all Global VPN Communities.</li><li>▪ <code>missing</code> - Rebuild status tree only for Global VPN Communities that do not have status trees.</li></ul>                                                                                                                                                                             |

## Example

```
[Expert@MDS:0]# fwm mds ver
This is Check Point Multi-Domain Security Management R82.10 -
Build 11
[Expert@MDS:0]#
```

# fwm printcert

## Description

Shows a SIC certificate's details.

### Note:

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
fwm [-d] printcert
      -obj <Name of Object> [-cert <Certificate Nick Name>] [-
verbose]
      -ca <CA Name> [-x509 <Name of File> [-p]] [-verbose]
      -f <Name of Binary Certificate File> [-verbose]
```

## Parameters

| Item                                 | Description                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                                   | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> <p>For complete debug instructions, see the description of the <code>fwm</code> process in <a href="#">sk97638</a>.</p> |
| -obj <Name of Object>                | Specifies the name of the managed object, for which to show the SIC certificate information.                                                                                                                                                                                                                                                                                                 |
| -cert <Certificate Nick Name>        | Specifies the certificate nick name.                                                                                                                                                                                                                                                                                                                                                         |
| -ca <CA Name>                        | <p>Specifies the name of the Certificate Authority.</p> <p><b>Note</b> - Check Point CA Name is <code>internal_ca</code>.</p>                                                                                                                                                                                                                                                                |
| -x509 <Name of File>                 | Specifies the name of the X.509 file.                                                                                                                                                                                                                                                                                                                                                        |
| -p                                   | Specifies to show the SIC certificate as a text file.                                                                                                                                                                                                                                                                                                                                        |
| -f <Name of Binary Certificate File> | Specifies the binary SIC certificate file to show.                                                                                                                                                                                                                                                                                                                                           |
| -verbose                             | Shows the information in verbose mode.                                                                                                                                                                                                                                                                                                                                                       |

## Examples

### Example 1 - Showing the SIC certificate of a Management Server

```
[Expert@MGMT:0]# fwm printcert -ca internal_ca
Subject: O=MGMT.checkpoint.com.s6t98x
Issuer: O=MGMT.checkpoint.com.s6t98x
Not Valid Before: Sun Apr 8 13:41:00 2018 Local Time
Not Valid After: Fri Jan 1 05:14:07 2038 Local Time
Serial No.: 1
Public Key: RSA (2048 bits)
Signature: RSA with SHA256
Key Usage:
    digitalSignature
    keyCertSign
    cRLSign
Basic Constraint:
    is CA
MD5 Fingerprint:
    7B:F9:7B:4C:BD:40:B9:1C:AB:2C:AE:CF:66:2E:E7:06
SHA-1 Fingerprints:
1. A6:43:3A:2B:1A:04:7F:A6:36:A6:2C:78:BF:22:D9:BC:F7:7E:4D:73

# fwm sic\_reset

## Description

Resets SIC on the Management Server.

For detailed procedure, see [sk65764: How to reset SIC](#).

### Warning:

- Before you run this command, take a Gaia Snapshot and a full backup of the Management Server.  
This command resets SIC between the Management Server and all its managed objects.
- This operation breaks trust in all Internal CA certificates and SIC trust across the managed environment.  
Therefore, we do not recommend it at all, except for real disaster recovery.

### Note

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsensv <IP Address or Name of Domain Management Server>
```

## Syntax

```
fwm [-d] sic_reset
```

## Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d        | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.<br/>For complete debug instructions, see the description of the <code>fwm</code> process in <a href="#">sk97638</a>.</p> |

# fwm snmp\_trap

## Description

Sends an SNMPv1 Trap to the specified host.

## Notes:

- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsensv <IP Address or Name of Domain Management Server>
```

- On a Multi-Domain Server, the SNMP Trap packet is sent from the IP address of the Leading Interface.

## Syntax

```
fwm [-d] snmp_trap [-v <SNMP OID>] [-g <Generic Trap Number>] [-s  
<Specific Trap Number>] [-p <Source Port>] [-c <SNMP Community>]  
<Target> ["<Message>"]
```

## Parameters

| Parameter                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-d</code>                              | <p>Runs the command in debug mode.</p> <p>Use only if you troubleshoot the command itself.</p> <p>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> <p>For complete debug instructions, see the description of the <code>fwm</code> process in <a href="#">sk97638</a>.</p>                                                                                                            |
| <code>-v &lt;SNMP OID&gt;</code>             | Specifies an optional SNMP OID to bind with the message.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>-g &lt;Generic Trap Number&gt;</code>  | <p>Specifies the generic trap number.</p> <p>One of these values:</p> <ul style="list-style-type: none"> <li>▪ 0 - For <code>coldStart</code> trap</li> <li>▪ 1 - For <code>warmStart</code> trap</li> <li>▪ 2 - For <code>linkDown</code> trap</li> <li>▪ 3 - For <code>linkUp</code> trap</li> <li>▪ 4 - For <code>authenticationFailure</code> trap</li> <li>▪ 5 - For <code>egpNeighborLoss</code> trap</li> <li>▪ 6 - For <code>enterpriseSpecific</code> trap (this is the default value)</li> </ul> |
| <code>-s &lt;Specific Trap Number&gt;</code> | <p>Specifies the unique trap type.</p> <p>Valid only if generic trap value is 6 (for <code>enterpriseSpecific</code>).</p> <p>Default value is 0.</p>                                                                                                                                                                                                                                                                                                                                                      |
| <code>-p &lt;Source Port&gt;</code>          | Specifies the source port, from which to send the SNMP Trap packets.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>-c &lt;SNMP Community&gt;</code>       | Specifies the SNMP community.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>&lt;Target&gt;</code>                  | <p>Specifies the managed target host, to which to send the SNMP Trap packets.</p> <p>Enter an IP address or a resolvable hostname.</p>                                                                                                                                                                                                                                                                                                                                                                     |
| <code>"&lt;Message&gt;"</code>               | Specifies the SNMP Trap text message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Example - Sending an SNMP Trap from a Management Server and capturing the traffic on the Security Gateway

```
[Expert@MGMT:0]# fwm snmp_trap -g 2 -c public 192.168.3.52 "My Trap Message"
[Expert@MGMT:0]#

[Expert@MyGW_192.168.3.52:0]# tcpdump -s 1500 -vvvv -i eth0 udp and host 192.168.3.51
tcpdump: listening on eth0, link-type EN10MB (Ethernet), capture size 1500 bytes
22:49:43.891287 IP (tos 0x0, ttl 64, id 0, offset 0, flags [DF], proto: UDP (17), length: 103)
192.168.3.51.53450 > MyGW_192.168.3.52.snmptrap: [udp sum ok] { SNMPv1 { Trap(58) E:2620.1.1
192.168.3.240 linkDown 1486440 E:2620.1.1.11.0="My Trap Message" } }
Pressed CTRL+C
[Expert@MyGW_192.168.3.52:0]#
```

# fwm unload

## Description

Unloads the policy from the specified managed Security Gateways or Cluster Members.

### Warning:

1. The `fwm unload` command prevents all traffic from passing through the Security Gateway (Cluster Member), because it disables the IP Forwarding in the Linux kernel on the specified Security Gateway (Cluster Member).
2. The `fwm unload` command removes all policies from the specified Security Gateway (Cluster Member).

This means that the Security Gateway (Cluster Member) accepts all incoming connections destined to all active interfaces without any filtering or protection enabled.

### Notes:

- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsensv <IP Address or Name of Domain Management Server>
```

- If it is necessary to remove the current policy, but keep the Security Gateway (Cluster Member) protected, then run the ["comp\\_init\\_policy" on page 964](#) command on the Security Gateway (Cluster Member).
- To load the policies on the Security Gateway (Cluster Member), run one of these commands on the Security Gateway (Cluster Member), or reboot:
  - ["fw fetch" on page 1154](#)
  - ["cpstart" on page 1032](#)
- In addition, see the ["fw unloadlocal" on page 1279](#) command.

## Syntax

```
fwm [-d] unload <GW1> <GW2> ... <GWN>
```

## Parameters

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                       | <p>Runs the command in debug mode.</p> <p>Use only if you troubleshoot the command itself.</p> <p>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> <p>For complete debug instructions, see the description of the <code>fwm</code> process in <a href="#">sk97638</a>.</p> |
| <GW1> <GW2><br>... <GWN> | <p>Specifies the managed Security Gateways by their main IP address or Object Name as configured in SmartConsole.</p>                                                                                                                                                                                                                                                                           |

## Example

```
[Expert@MyGW:0]# cpstat -f policy fw

[Expert@MyGW:0]#
```

# fwm ver

## Description

Shows the Check Point version of the Security Management Server.

**Note** - On a Multi-Domain Server, you can run this command:

- In the context of the MDS:

```
mdsenv
```

- In the context of a Domain Management Server:

```
mdsenv <IP Address or Name of Domain
Management Server>
```

## Syntax

```
fwm [-d] ver [-f <Output File>]
```

## Parameters

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d               | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> <p>For complete debug instructions, see the description of the <code>fwm</code> process in <a href="#">sk97638</a>.</p> |
| -f <Output File> | Specifies the name of the output file, in which to save this information.                                                                                                                                                                                                                                                                                                                    |

## Example

```
[Expert@MGMT:0]# fwm ver
This is Check Point Security Management Server R82.10 - Build 11
[Expert@MGMT:0]#
```

## fwm verify

**Important** - This command is obsolete for R80 and higher. Use the ["mgmt\\_cli" on page 386](#) command to verify a policy on a managed Security Gateway.

### Description

Verifies the specified policy package without installing it.

### Note

On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsend <IP Address or Name of Domain Management Server>
```

### Syntax

```
fwm [-d] verify <Policy Name>
```

### Parameters

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                   |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d            | Runs the command in debug mode.<br>Use only if you troubleshoot the command itself.<br><b>★ Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.<br>For complete debug instructions, see the description of the <code>fwm</code> process in <a href="#">sk97638</a> . |
| <Policy Name> | Specifies the name of the policy package as configured in SmartConsole.                                                                                                                                                                                                                                                                                                       |

### Example

```
[Expert@MGMT:0]# fwm verify Standard
Verifier messages:
Error: Rule 1 Hides rule 2 for Services & Applications: any .
[Expert@MGMT:0]#
```

# inet\_alert

## Description

Notifies an Internet Service Provider (ISP) when a company's corporate network is under attack. This command forwards log messages generated by the alert daemon on your Check Point Security Gateway to an external Management Station. This external Management Station is usually located at the ISP site. The ISP can then analyze the alert and react accordingly.

This command uses the Event Logging API (ELA) protocol to send the alerts. The Management Station receiving the alert must be running the ELA Proxy.

If communication with the ELA Proxy is to be authenticated or encrypted, a key exchange must be performed between the external Management Station running the ELA Proxy at the ISP site and the Check Point Security Gateway generating the alert.

## Procedure

| Step | Instructions                                                                                                                                                                                                          |
|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Connect with SmartConsole to the applicable Security Management Server or Domain Management Server, which manages the applicable Security Gateway that should forward log messages to an external Management Station. |
| 2    | From the top left <b>Menu</b> , click <b>Global properties</b> .                                                                                                                                                      |
| 3    | Click on the <b>[+]</b> near the <b>Log and Alert</b> and click <b>Alerts</b> .                                                                                                                                       |
| 4    | Clear the <b>Send user defined alert no. 1 to SmartView Monitor</b> .                                                                                                                                                 |
| 5    | Select the next option <b>Run UserDefined script under the above</b> .                                                                                                                                                |
| 6    | Enter the applicable <b>inet_alert</b> syntax (see the <i>Syntax</i> section below).                                                                                                                                  |
| 7    | Click <b>OK</b> .                                                                                                                                                                                                     |
| 8    | Install the Access Control Policy on the applicable Security Gateway.                                                                                                                                                 |

## Syntax

```
inet_alert -s <IP Address> [-o] [-a <Auth Type>] [-p <Port>] [-f <Token> <Value>] [-m <Alert Type>]
```

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Parameters

| Parameter                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-s &lt;IP Address&gt;</code>          | The IPv4 address of the ELA Proxy (usually located at the ISP site).                                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>-o</code>                             | Prints the alert log received to <code>stdout</code> .<br>Use this option when <code>inet_alert</code> is part of a pipe syntax ( <code>&lt;some command&gt;   inet_alert ...</code> ).                                                                                                                                                                                                                                                                                     |
| <code>-a &lt;Auth Type&gt;</code>           | Specifies the type of connection to the ELA Proxy.<br>One of these values: <ul style="list-style-type: none"> <li>■ <code>ssl_opsec</code> - The connection is authenticated and encrypted (this is the default).</li> <li>■ <code>auth_opsec</code> - The connection is authenticated.</li> <li>■ <code>clear</code> - The connection is neither authenticated, nor encrypted.</li> </ul>                                                                                  |
| <code>-p &lt;Port&gt;</code>                | Specifies the port number on the ELA proxy. Default port is 18187.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>-f &lt;Token&gt; &lt;Value&gt;</code> | A field to be added to the log, represented by a <code>&lt;Token&gt; &lt;Value&gt;</code> pair as follows: <ul style="list-style-type: none"> <li>■ <code>&lt;Token&gt;</code> - The name of the field to be added to the log. Cannot contain spaces.</li> <li>■ <code>&lt;Value&gt;</code> - The field's value. Cannot contain spaces.</li> </ul> <p>This option can be used multiple times to add multiple <code>&lt;Token&gt; &lt;Value&gt;</code> pairs to the log.</p> |

| Parameter                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-m &lt;Alert Type&gt;</code> | <p>The alert to be triggered at the ISP site.</p> <p>This alert overrides the alert specified in the log message generated by the alert daemon.</p> <p>The response to the alert is handled according to the actions specified in the ISP Security Policy:</p> <p>These alerts execute the OS commands:</p> <ul style="list-style-type: none"> <li>▪ <code>alert</code> - Popup alert command</li> <li>▪ <code>mail</code> - Mail alert command</li> <li>▪ <code>snmptrap</code> - SNMP trap alert command</li> <li>▪ <code>spoofalert</code> - Anti-Spoof alert command</li> </ul> <p>These NetQuota and ServerQuota alerts execute the OS commands specified in the <code>\$FWDIR/conf/objects.C</code> file:<br/> <code>value=clientquotaalert. Parameter=clientquotaalertcmd</code></p> |

## Exist Status

| Exit Status | Description                                              |
|-------------|----------------------------------------------------------|
| 0           | Execution was successful.                                |
| 102         | Undetermined error.                                      |
| 103         | Unable to allocate memory.                               |
| 104         | Unable to obtain log information from <code>stdin</code> |
| 106         | Invalid command line arguments.                          |
| 107         | Failed to invoke the OPSEC API.                          |

## Example

```
inet_alert -s 10.0.2.4 -a clear -f product cads -m alert
```

This command specifies to perform these actions in the event of an attack:

- Establish a clear connection with the ELA Proxy located at IP address 10.0.2.4
- Send a log message to the specified ELA Proxy. Set the product field of this log message to `cads`
- Trigger the OS command specified in the SmartConsole > **Menu** > **Global properties** > **Log and Alert** > **Popup Alert Command** field.

# ldapcmd

## Description

This is an LDAP utility that controls these features:

| Feature    | Description                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cache      | LDAP cache operations, such as emptying the cache, as well as providing debug information.                                                                                                                                                                                                                                                                                                                             |
| Statistics | <p>LDAP search statistics, such as:</p> <ul style="list-style-type: none"><li>▪ All user searches</li><li>▪ Pending lookups (when two or more lookups are identical)</li><li>▪ Total lookup time (the total search time for a specific lookup)</li><li>▪ Cache statistics such as hits and misses</li></ul> <p>These statistics are saved in the <code>\$FWDIR/log/ldap_pid_&lt;Process PID&gt;.stats</code> file.</p> |
| Logging    | View the alert and warning logs.                                                                                                                                                                                                                                                                                                                                                                                       |

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
ldapcmd [-d <Debug Level>] -p {<Process Name> | all} <Command>
```

## Parameters

| Parameter                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-d &lt;Debug Level&gt;</code>          | Runs the command in debug mode with the specified TDERROR debug level.<br>Valid values are from 0 (disabled) to 5 (maximum level, recommended).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>-p {&lt;Process Name&gt;   all}</code> | Runs on a specified Check Point process, or all supported Check Point processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

# ldapcompare

## Description

This is an LDAP utility that performs compare queries and prints a message whether the result returned a match or not.

This utility opens a connection to an LDAP directory server, binds, and performs the comparison specified on the command line or from a specified file.

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
ldapcompare [-d <Debug Level>] [<Options>] <DN> {<Attribute>
<Value> | <Attribute> <Base64 Value>}
```

## Parameters

| Parameter                           | Description                                                                                                                                     |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-d &lt;Debug Level&gt;</code> | Runs the command in debug mode with the specified TDERROR debug level.<br>Valid values are from 0 (disabled) to 5 (maximum level, recommended). |
| <code>&lt;Options&gt;</code>        | See the tables below: <ul style="list-style-type: none"> <li>■ Compare options</li> <li>■ Common options</li> </ul>                             |
| <code>&lt;DN&gt;</code>             | Specifies the Distinguished Name.                                                                                                               |
| <code>&lt;Attribute&gt;</code>      | Specifies the assertion attribute.                                                                                                              |
| <code>&lt;Value&gt;</code>          | Specifies the assertion value.                                                                                                                  |
| <code>&lt;Base64 Value&gt;</code>   | Specifies the Base64 encoding of the assertion value.                                                                                           |

## Compare options

| Option                                                              | Description                                                                                                                                                           |
|---------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-E [!]&lt;Extension&gt; [=&lt;Extension Parameter&gt;]</code> | Specifies the compare extensions.<br><b>Note</b> - The exclamation sign "!" indicates criticality.<br>For example: <code>!dontUseCopy</code> = Do <b>not</b> use Copy |
| <code>-M</code>                                                     | Enables the Manage DSA IT control.<br>Use the " <code>-MM</code> " option to make it critical.                                                                        |
| <code>-P &lt;LDAP Protocol Version&gt;</code>                       | Specifies the LDAP protocol version. Default version is 3.                                                                                                            |
| <code>-z</code>                                                     | Enables the quiet mode.<br>The command does not print anything. You can use the command return values.                                                                |

## Common options

| Option                          | Description                                                 |
|---------------------------------|-------------------------------------------------------------|
| <code>-D &lt;Bind DN&gt;</code> | Specifies the LDAP Server administrator Distinguished Name. |

| Option                                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Option                                               | Description                                                                                 |
|------------------------------------------------------|---------------------------------------------------------------------------------------------|
| -N                                                   | Specifies not to use the reverse DNS to canonicalize SASL host name.                        |
| -o <i>&lt;Option&gt; [=&lt;Option Parameter&gt;]</i> | Specifies the general options:<br>nettimeout={ <i>&lt;Timeout in Sec&gt;</i>   none   max}  |
| -O <i>&lt;Properties&gt;</i>                         | Specifies the SASL security properties.                                                     |
| -p <i>&lt;LDAP Server Port&gt;</i>                   | Specifies the LDAP Server port. Default is 389.                                             |
| -Q                                                   | Specifies to use the SASL Quiet mode.                                                       |
| -R <i>&lt;Realm&gt;</i>                              | Specifies the SASL realm.                                                                   |
| -U <i>&lt;Authentication Identity&gt;</i>            | Specifies the SASL authentication identity.                                                 |
| -v                                                   | Runs in verbose mode (prints the diagnostics to <i>stdout</i> ).                            |
| -V                                                   | Prints version information (use the "-vv" option only).                                     |
| -w <i>&lt;LDAP Admin Password&gt;</i>                | Specifies the LDAP Server administrator password (for simple authentication).               |
| -W                                                   | Specifies to prompt the user for the LDAP Server administrator password.                    |
| -x                                                   | Specifies to use simple authentication.                                                     |
| -X <i>&lt;Authorization Identity&gt;</i>             | Specifies the SASL authorization identity (either "dn:<DN>", or "u:<Username>" option).     |
| -y <i>&lt;File&gt;</i>                               | Specifies to read the LDAP Server administrator password from the <i>&lt;File&gt;</i> .     |
| -Y <i>&lt;SASL Mechanism&gt;</i>                     | Specifies the SASL mechanism.                                                               |
| -Z                                                   | Specifies to start the TLS request.<br>Use the "-ZZ" option to require successful response. |

# ldapmemberconvert

## Description

This is an LDAP utility that ports from the "Member" attribute values in LDAP group entries to the "MemberOf" attribute values in LDAP member (User or Template) entries.

This utility converts the LDAP server data to work in either the "MemberOf" mode, or "Both" mode. The utility searches through all specified group or template entries that hold one or more "Member" attribute values and modifies each value. The utility searches through all specified group/template entries and fetches their "Member" attribute values.

Each value is the DN of a member entry. The entry identified by this DN is added to the "MemberOf" attribute value of the group/template DN at hand. In addition, the utility delete those "Member" attribute values from the group/template, unless you run the command in the "Both" mode.

When you run the command, it creates a log file `ldapmemberconvert.log` in the current working directory. The command logs all modifications done and errors encountered in that log file.

**Important** - Back up the LDAP server database *before* you run this conversion utility.

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
ldapmemberconvert [-d <Debug Level>] -h <LDAP Server> -p <LDAP
Server Port> -D <LDAP Admin DN> -w <LDAP Admin Password> -m
<Member Attribute Name> -o <MemberOf Attribute Name> -c <Member
ObjectClass Value> [-B] [-f <File> | -g <Group DN>] [-L <LDAP
Server Timeout>] [-M <Number of Updates>] [-S <Size>] [-T <LDAP
Client Timeout>] [-Z]
```

## Parameters

| Parameter                                        | Description                                                                                                                                                                                                                                                                        |
|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-d &lt;Debug Level&gt;</code>              | Runs the command in debug mode with the specified TDERROR debug level.<br>Valid values are from 0 (disabled) to 5 (maximum level, recommended).                                                                                                                                    |
| <code>-h &lt;LDAP Server&gt;</code>              | Specifies the LDAP Server server by its IP address or resolvable hostname.<br>If you do not specify the LDAP Server explicitly, the command connects to <code>localhost</code> .                                                                                                   |
| <code>-p &lt;LDAP Server Port&gt;</code>         | Specifies the LDAP Server port. Default is 389.                                                                                                                                                                                                                                    |
| <code>-D &lt;LDAP Admin DN&gt;</code>            | Specifies the LDAP Server administrator Distinguished Name.                                                                                                                                                                                                                        |
| <code>-w &lt;LDAP Admin Password&gt;</code>      | Specifies the LDAP Server administrator password.                                                                                                                                                                                                                                  |
| <code>-m &lt;Member Attribute Name&gt;</code>    | Specifies the LDAP attribute name when fetching and (possibly) deleting a group Member attribute value.                                                                                                                                                                            |
| <code>-o &lt;MemberOf Attribute Name&gt;</code>  | Specifies the LDAP attribute name for adding an LDAP "memberOf" attribute value.                                                                                                                                                                                                   |
| <code>-c &lt;Member ObjectClass Value&gt;</code> | Specifies the LDAP "ObjectClass" attribute value that defines, which type of member to modify.<br>You can specify multiple attribute values with this syntax:<br><pre>-c &lt;Member Object Class 1&gt; -c &lt;Member Object Class 2&gt; ... -c &lt;Member Object Class N&gt;</pre> |
| <code>-B</code>                                  | Specifies to run in "Both" mode.                                                                                                                                                                                                                                                   |
| <code>-f &lt;File&gt;</code>                     | Specifies the file that contains a list of Group DNs separated by a new line:<br><pre>&lt;Group DN 1&gt; &lt;Group DN 2&gt; ... &lt;Group DN N&gt;</pre> Length of each line is limited to 256 characters.                                                                         |

| Parameter                                   | Description                                                                                                                                                                                                                                 |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-g &lt;Group DN&gt;</code>            | <p>Specifies the Group or Template Distinguished Name, on which to perform the conversion.</p> <p>You can specify multiple Group DNs with this syntax:</p> <pre>-g &lt;Group DN 1&gt; -g &lt;Group DN 2&gt; ... -g &lt;Group DN N&gt;</pre> |
| <code>-L &lt;LDAP Server Timeout&gt;</code> | <p>Specifies the Server side time limit for LDAP operations, in seconds.</p> <p>Default is "never".</p>                                                                                                                                     |
| <code>-M &lt;Number of Updates&gt;</code>   | <p>Specifies the maximum number of simultaneous member LDAP updates.</p> <p>Default is 20.</p>                                                                                                                                              |
| <code>-S &lt;Size&gt;</code>                | <p>Specifies the Server side size limit for LDAP operations, in number of entries.</p> <p>Default is "none".</p>                                                                                                                            |
| <code>-T &lt;LDAP Client Timeout&gt;</code> | <p>Specifies the Client side timeout for LDAP operations, in milliseconds.</p> <p>Default is "never".</p>                                                                                                                                   |
| <code>-Z</code>                             | <p>Specifies to use SSL connection.</p>                                                                                                                                                                                                     |

## Notes

There are two "GroupMembership" modes. You must keep these modes consistent:

- `template-to-groups`
- `user-to-groups`

For example, if you apply conversion on LDAP users to include the "memberOf" attributes for their groups, then this conversion has to be applied on LDAP defined templates for their groups.

## Troubleshooting

### *Symptom:*

A command fails with an error message stating the connection stopped unexpectedly when you run it with the parameter `-M <Number of Updates>`.

### *Root Cause:*

The LDAP server could not handle that many LDAP requests simultaneously and closed the connection.

### *Solution:*

Run the command again with a lower value for the `"-M"` parameter. The default value should be adequate, but can also cause a connection failure in extreme situations. Continue to reduce the value until the command runs normally. Each time you run the command with the same set of groups, the command continues from where it left off.

## Examples

### Example 1

A group is defined with the DN "cn=cpGroup, ou=groups, ou=cp, c=us" and these attributes:

```
...
cn=cpGroup
uniquemember="cn=member1, ou=people, ou=cp, c=us"
uniquemember="cn=member2, ou=people, ou=cp, c=us"
...
```

For the two member entries:

```
...
cn=member1
objectclass=fw1Person
...
```

and:

```
...
cn=member2
objectclass=fw1Person
...
```

Run:

```
[Expert@MGMT:0]# ldapconvert -g cn=cpGroup,ou=groups,ou=cp,c=us -h MyLdapServer -d cn=admin -w secret -m uniquemember -o memberof -c fw1Person
```

The result for the group DN is:

```
...
cn=cpGroup
...
```

The result for the two member entries is:

```
...
cn=member1
objectclass=fw1Person
memberof="cn=cpGroup,ou=groups,ou=cp,c=us"
...
```

and:

```
...
cn=member2
objectclass=fw1Person
memberof="cn=cpGroup,ou=groups,ou=cp,c=us"
...
```

If you run the same command with the "-B" parameter, it produces the same result, but the group entry is not modified.

## Example 2

If there is another member attribute value for the same group entry:

```
uniquemember="cn=templatel,ou=people, ou=cp,c=us"
```

and the template is:

```
cn=member1  
objectclass=fwlTemplate
```

Then after running the same command, the template entry stays intact, because of the parameter "-c fwlPerson", but the object class of "templatel" is "fwlTemplate".

# ldapmodify

## Description

This is an LDAP utility that imports users to an LDAP server. The input file must be in the LDIF format.

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
ldapmodify [-d <Debug Level>] [-h <LDAP Server>] [-p <LDAP Server Port>] [-D <LDAP Admin DN>] [-w <LDAP Admin Password>] [-a] [-b] [-c] [-F] [-k] [-n] [-r] [-v] [-T <LDAP Client Timeout>] [-Z] [-f <Input File> .ldif | <<Entry>>]
```

## Parameters

| Parameter                                   | Description                                                                                                                                                                      |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-d &lt;Debug Level&gt;</code>         | Runs the command in debug mode with the specified TDERROR debug level.<br>Valid values are from 0 (disabled) to 5 (maximum level, recommended).                                  |
| <code>-h &lt;LDAP Server&gt;</code>         | Specifies the LDAP Server server by its IP address or resolvable hostname.<br>If you do not specify the LDAP Server explicitly, the command connects to <code>localhost</code> . |
| <code>-p &lt;LDAP Server Port&gt;</code>    | Specifies the LDAP Server port. Default is 389.                                                                                                                                  |
| <code>-D &lt;LDAP Admin DN&gt;</code>       | Specifies the LDAP Server administrator Distinguished Name.                                                                                                                      |
| <code>-w &lt;LDAP Admin Password&gt;</code> | Specifies the LDAP Server administrator password.                                                                                                                                |

| Parameter                             | Description                                                                                                                                                                                                |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -a                                    | Specifies that this is the LDAP "add" operation.                                                                                                                                                           |
| -b                                    | Specifies to read values from files (for binary attributes).                                                                                                                                               |
| -c                                    | Specifies to ignore errors during continuous operation.                                                                                                                                                    |
| -F                                    | Specifies to force changes on all records.                                                                                                                                                                 |
| -k                                    | Specifies the Kerberos bind.                                                                                                                                                                               |
| -K                                    | Specifies the Kerberos bind, part 1 only.                                                                                                                                                                  |
| -n                                    | Specifies to print the LDAP "add" operations, but do not actually perform them.                                                                                                                            |
| -r                                    | Specifies to replace values, instead of adding values.                                                                                                                                                     |
| -v                                    | Specifies to run in verbose mode.                                                                                                                                                                          |
| -T <i>&lt;LDAP Client Timeout&gt;</i> | Specifies the Client side timeout for LDAP operations, in milliseconds.<br>Default is "never".                                                                                                             |
| -Z                                    | Specifies to use SSL connection.                                                                                                                                                                           |
| -f <i>&lt;Input File&gt;.ldif</i>     | Specifies to read from the <i>&lt;Input File&gt;.ldif</i> file.<br>The input file must be in the LDIF format.                                                                                              |
| < <i>&lt;Entry&gt;</i>                | Specifies to read the entry from the <i>stdin</i> .<br>The "<" character is mandatory part of the syntax.<br>It specifies the input comes from the standard input (from the data you enter on the screen). |

# ldapsearch

## Description

This is an LDAP utility that queries an LDAP directory and returns the results.

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

```
ldapsearch [-d <Debug Level>] [-h <LDAP Server>] [-p <LDAP Port>]
[-D <LDAP Admin DN>] [-w <LDAP Admin Password>] [-A] [-B] [-b
<Base DN>] [-F <Separator>] [-l <LDAP Server Timeout>] [-s
<Scope>] [-S <Sort Attribute>] [-t] [-T <LDAP Client Timeout>] [-
u] [-z <Number of Search Entries>] [-Z] <Filter> [<Attributes>]
```

## Parameters

| Parameter                                   | Description                                                                                                                                                                      |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-d &lt;Debug Level&gt;</code>         | Runs the command in debug mode with the specified TDERROR debug level.<br>Valid values are from 0 (disabled) to 5 (maximum level, recommended).                                  |
| <code>-h &lt;LDAP Server&gt;</code>         | Specifies the LDAP Server server by its IP address or resolvable hostname.<br>If you do not specify the LDAP Server explicitly, the command connects to <code>localhost</code> . |
| <code>-p &lt;LDAP Port&gt;</code>           | Specifies the LDAP Server port. Default is 389.                                                                                                                                  |
| <code>-D &lt;LDAP Admin DN&gt;</code>       | Specifies the LDAP Server administrator Distinguished Name.                                                                                                                      |
| <code>-w &lt;LDAP Admin Password&gt;</code> | Specifies the LDAP Server administrator password.                                                                                                                                |
| <code>-A</code>                             | Specifies to retrieve attribute names only, without values.                                                                                                                      |

| Parameter                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-B</code>                                  | Specifies not to suppress the printing of non-ASCII values.                                                                                                                                                                                                                                                                                                                                                           |
| <code>-b &lt;Base DN&gt;</code>                  | Specifies the Base Distinguished Name (DN) for search.                                                                                                                                                                                                                                                                                                                                                                |
| <code>-F &lt;Separator&gt;</code>                | Specifies the print separator character between attribute names and their values.<br>The default separator is the equal sign (=).                                                                                                                                                                                                                                                                                     |
| <code>-l &lt;LDAP Server Timeout&gt;</code>      | Specifies the Server side time limit for LDAP operations, in seconds.<br>Default is "never".                                                                                                                                                                                                                                                                                                                          |
| <code>-s &lt;Scope&gt;</code>                    | Specifies the search scope. One of these: <ul style="list-style-type: none"> <li>■ base</li> <li>■ one</li> <li>■ sub</li> </ul>                                                                                                                                                                                                                                                                                      |
| <code>-S &lt;Sort Attribute&gt;</code>           | Specifies to sort the results by the values of this attribute.                                                                                                                                                                                                                                                                                                                                                        |
| <code>-t</code>                                  | Specifies to write values to files in the <code>/tmp/</code> directory.<br>Writes each <code>&lt;attribute&gt;-&lt;value&gt;</code> pair to a separate file named:<br><code>/tmp/ldapsearch-&lt;Attribute&gt;-&lt;Value&gt;</code><br>For example, for the <code>fwlcolor</code> attribute with the value <code>a00188</code> , the command writes to the file named:<br><code>/tmp/ldapsearch-fwlcolor-a00188</code> |
| <code>-T &lt;LDAP Client Timeout&gt;</code>      | Specifies the Client side timeout for LDAP operations, in milliseconds.<br>Default is never.                                                                                                                                                                                                                                                                                                                          |
| <code>-u</code>                                  | Specifies to show user-friendly entry names in the output.<br>For example:<br>shows <code>cn=Babs Jensen, users, omi</code><br>instead of <code>cn=Babs Jensen, cn=users, cn=omi</code>                                                                                                                                                                                                                               |
| <code>-z &lt;Number of Search Entries&gt;</code> | Specifies the maximum number of entries to search on the LDAP Server.                                                                                                                                                                                                                                                                                                                                                 |
| <code>-Z</code>                                  | Specifies to use SSL connection.                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>&lt;Filter&gt;</code>                      | LDAP search filter compliant with RFC-1558.<br>For example:<br><code>objectclass=fwlhost</code>                                                                                                                                                                                                                                                                                                                       |

| Parameter                       | Description                                                                                                                              |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;Attributes&gt;</code> | Specifies the list of attributes to retrieve.<br>If you do not specify attributes explicitly, then the command retrieves all attributes. |

## Example

```
[Expert@MGMT:0]# ldapsearch -p 18185 -b cn=omi objectclass=fwlhost objectclass
```

With this syntax, the command:

1. Connects to the LDAP Server to port 18185.
2. Connects to the LDAP Server with Base DN "cn=omi".
3. Queries the LDAP directory for "fwlhost" objects.
4. For each object found, prints the value of its "objectclass" attribute.

# mcd

## Description

This command changes current working directory to the specified directory in the `$FWDIR` directory in the context of a Domain Management Server.

## Syntax

```
mdsenv <IP Address or Name of Domain Management Server>  
mcd <Name of Directory in $FWDIR>
```

## Example

```
[Expert@MDS:0]# mdsstat

# mds\_backup

## Description

The `mds_backup` command backs up binaries and data from a Multi-Domain Server to a user specified working directory.

You then copy the backup files from the working directory to external storage.

This command requires Multi-Domain Superuser privileges.

The `mds_backup` command runs the `gtar` and `dump` commands to back up all databases. The collected information is stored in one `*.tar` file. The file name is a combination of the backup date and time and is saved in the current working directory. For example:

`13Sep2015-141437.mdsbk.tar`

### Backing up and restoring in Management High Availability environment:

- To back up and restore a consistent environment, make sure to collect and restore the backups and snapshots from all servers in the High Availability environment at the same time.
- Make sure other administrators do not make changes in SmartConsole until the backup operation is completed.

For more information:

- About Gaia Backup and Gaia Snapshot, see the [R82.10 Gaia Administration Guide](#).
- About Virtual Machine Snapshots, see the vendor documentation.

## Notes:

- Do not create or delete Domains or Domain Management Servers until the backup operation completes.
- It is important to run the `mds_backup` command from directories that are not backed up.  
For example, when you back up a Multi-Domain Server, do not run the `mds_backup` command from the `/opt/CPmds-<Current_Release>/` directory, because it is a circular reference (backup of directory, in which it is necessary to write files).  
Run the `mds_backup` command from a location outside the product directory tree to be backed up (for example: `/home/admin`, `/var/log/`. This becomes the working directory.
- The `mds_backup` command does not collect the active Security log file (`*.log`) and Audit log file (`*.adtlog`).  
This is necessary to prevent inconsistencies during the read-write operations.
- ★ **Best Practice** - Perform a log switch before you start the backup procedure.
- You can back up the Multi-Domain Server configuration without the log files. This backup is typically significantly smaller than a full backup with logs. To back up without log files, add this line to the file `$MDSDIR/conf/mds_exclude.dat` configuration file:  

`log/*`
- After the backup completes, copy the backup `*.tar` file, together with the `mds_restore`, and `gtar` binary files, to your external backup location.

## Syntax

```
mds_backup -h
```

```
mds_backup [-b] [-d <Target Directory>] [-ds] [-l] [-mask] [-s] [-v] [-x]
```

## Parameters

| Parameter             | Description                                                                                                                                                                  |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -h                    | Shows help text.                                                                                                                                                             |
| -b                    | Batch mode - executes without asking anything.                                                                                                                               |
| -d <Target Directory> | Specifies the output directory.<br>If not specified explicitly, the backup file is saved to the current directory.<br>You cannot save the backup file to the root directory. |
| -ds                   | Disconnects all current sessions and discards their unpublished changes before the backup starts.                                                                            |
| -l                    | Excludes logs from the backup.                                                                                                                                               |
| -mask                 | Hide sensitive information in the Postgres database in the backup.                                                                                                           |
| -s                    | Stops Multi-Domain processes before the backup starts.                                                                                                                       |
| -v                    | "Dry run" - Shows all files to be backed up, but does not perform the backup operation.                                                                                      |
| -x                    | Excludes binary files from the backup.<br>The binary files are listed in the <code>\$MDSDIR/conf/mds_binaries_exclude.dat</code> file.                                       |

# mds\_restore

## Description

Use the `mds_restore` command to restore a Multi-Domain Server / Multi-Domain Log Server that was backed up with the ["mds\\_backup" on page 757](#) command.

-  **Important** - You must restore on the server that runs same software version, from which you collected this backup.  
Example: If you collected a backup on a server with version "XX" and Jumbo Hotfix Accumulator Take "YY", then you must restore on a server with version "XX" and Jumbo Hotfix Accumulator Take "YY".
-  **Best Practice** - If the Multi-Domain Security Management environment has multiple Multi-Domain Servers, restore all Multi-Domain Servers at the same time.
-  **Backing up and restoring in Management High Availability environment:**
  - To back up and restore a consistent environment, make sure to collect and restore the backups and snapshots from all servers in the High Availability environment at the same time.
  - Make sure other administrators do not make changes in SmartConsole until the backup operation is completed.

For more information:

- About Gaia Backup and Gaia Snapshot, see the [R82.10 Gaia Administration Guide](#).
- About Virtual Machine Snapshots, see the vendor documentation.

## To restore a Multi-Domain Server:

1. Connect to the command line on the Multi-Domain Server.
2. Log in to the Expert mode.
3. Go to the directory where the backup file is located.
4. Run:

```
./mds_restore <backup_file>
```

5. If you restore on a Multi-Domain Server with a new IP address, configure the new IP address.

# mdscmd

## Description

In versions lower than R80, this utility executed various commands on the Multi-Domain Server.

Starting from R80, this command is obsolete.

You must use other commands. If there is no alternative command, then perform the applicable action in SmartConsole.

| MDSCMD command in pre-R80 versions                      | Alternative command in R80 and above                                                   |

# mdsconfig

## Description

This command starts the Multi-Domain Server Configuration Program. This tool configures specific settings for the installed Check Point products.

 **Note** - This command updates the database schema before it imports. First, the command runs pre-upgrade verification. If no errors are found, migration continues. If there are errors, you must fix them on the source R7x Domain Management Server according to instructions in the error messages. Then do this procedure again.

For the complete procedure, see the [R82.10 Installation and Upgrade Guide](#).

## Syntax

```
mdsconfig
```

## Menu Options

| Menu Option               | Description                                                                                                                                                                                                                                                                                               |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Leading VIP Interfaces    | The Leading VIP Interfaces are real interfaces connected to an external network.<br>These interfaces are used when you configure virtual IP addresses for Domain Management Servers.                                                                                                                      |
| Licenses                  | Manages Check Point licenses and contracts on this server.                                                                                                                                                                                                                                                |
| Random Pool               | Configures the RSA keys, to be used by Gaia Operating System.                                                                                                                                                                                                                                             |
| Groups                    | Usually, the Multi-Domain Server is given group permission for access and execution.<br>You may now name such a group or instruct the installation procedure to give no group permissions to the server.<br>In the latter case, only the Super-User is able to access and execute commands on the server. |
| Certificate's Fingerprint | Shows the ICA's Fingerprint.<br>This fingerprint is a text string derived from the server's ICA certificate.<br>This fingerprint verifies the identity of the server when you connect to it with SmartConsole.                                                                                            |

| Menu Option                                         | Description                                                                                                                                                                                                                                                                  |

## Example - Menu on a Multi-Domain Server

```
[Expert@MyMDS:0]# mdsconfig

Welcome to Multi-Domain Server Configuration Program
=====
This program will let you re-configure your Multi-Domain Server configuration.

Configuration Options:
-----
(1)  Leading VIP Interfaces
(2)  Licenses
(3)  Random Pool
(4)  Groups
(5)  Certificate's Fingerprint
(6)  Administrators
(7)  GUI clients
(8)  Automatic Start of Multi-Domain Server
(9)  P1Shell
(10) Start Multi-Domain Server Password
(11) IPv6 Support for Multi-Domain Server
(12) IPv6 Support for Existing Domain Management Servers

(13) Exit

Enter your choice (1-13):
```

# mdsenv

## Description

Use the `mdsenv` command to set shell environment variables to run commands on a specified Domain Management Server.

When run without an argument, the command sets the shell for Multi-Domain Server level commands (["mdsstart" on page 770](#), ["mdsstop" on page 777](#), and so on).

## Syntax

```
mdsenv [<Name or IP address of Domain Management Server>]
```

## Parameters

| Parameter                                                     | Description                                                         |
|---------------------------------------------------------------|---------------------------------------------------------------------|
| <i>&lt;Name or IP address of Domain Management Server&gt;</i> | Specifies the Domain Management Server by its name or IPv4 address. |

## Example

```
[Expert@MyMDS:0]# mdsstat
+-----+
+-----+
|                                     |
|                                     | Processes status checking
|                                     |
+-----+-----+-----+-----+-----+
+-----+-----+-----+-----+-----+
| Type | Name                | IP address          | FWM                | FWD
|      | CPD                  | CPCA                |                    |
+-----+-----+-----+-----+-----+
+-----+-----+-----+-----+-----+
| MDS   |      -               | 192.168.3.51        | up 10086           | up

+-----+-----+-----+-----+-----+
+-----+-----+-----+-----+-----+
| CMA   | MyDomain_Server     | 192.168.3.240       | up 10891           | up
8199    | up 7670             | up 9536             |                    |
+-----+-----+-----+-----+-----+
+-----+-----+-----+-----+-----+
| Total Domain Management Servers checked: 1      1 up    0 down
|
| Tip: Run mdsstat -h for legend
|
+-----+
+-----+
[Expert@MyMDS:0]#
[Expert@MyMDS:0]# mdsenv MyDomain_Server
[Expert@MyMDS:0]#
[Expert@MyMDS:0]# echo $FWDIR
/opt/CPmds-R82.10/customers/MyDomain_Server/CPsuite-R82.10/fw1
[Expert@MyMDS:0]#
```

# mdsquerydb

## Description

The `mdsquerydb` is an advanced database query tool that administrators can use to run shell scripts to get information from the Multi-Domain Security Management databases.

Use this command to get information from the Multi-Domain Server, Domain Management Server, and Global databases.

 **Note** - The system comes with pre-defined queries, defined in the `$MDSDIR/confqueries.conf` configuration file. Do **not** change or delete these queries.

## Syntax

```
mdsquerydb <key_name> [-f <output_file_name>]
```

## Parameters

| Parameter                                | Description                                                                                                                     |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;key_name&gt;</code>            | Query key, which must be defined in the pre-defined queries configuration file.                                                 |
| <code>-f &lt;output_file_name&gt;</code> | Send the query results to the specified file name. If this parameter is not specified, the data is sent to the standard output. |

## Pre-Defined Query Keys

```
Keys for Multi-Domain environment:
-----
GlobalNetworkObjects    Get name and type of all global network objects
NetworkObjects          Get all Domains' internal Check Point installed network objects
Domains                 Get names of all Domains Irit B comment from QA Draft
Administrators           Get names of all Administrators
MDSs                    Get names and IPs of all MDSs
DomainManagementServers Get names of all Domain Servers
GuiClients              Get names and IPs of all gui clients
CMAs                    Backwards Compatibility (DomainManagementServers)
Customers               Backwards Compatibility (Domains)
Keys for Domain environment:
-----
NetworkObjects          Get name and type of all network objects
Gateways                Get names and IPs of all gateways
```

## Example 1 - Retrieve list of all defined keys

```
[Expert@MDS:0]# mdsquerydb
```

## Example 2 - Send a list of Domains in the Multi-Domain Server database to the standard output

```
[Expert@MDS:0]# mdsenv  
[Expert@MDS:0]# mdsquerydb Domains
```

## Example 3 - Send a list of network objects in the global database to the /tmp/gateways.txt file

```
[Expert@MDS:0]# mdsenv  
[Expert@MDS:0]# mdsquerydb NetworkObjects -f /tmp/gateways.txt
```

## Example 4 - Get a list of gateway objects in the Domain Management Server "DServer1"

```
[Expert@MDS:0]# mdsenv My_Domain_Server  
[Expert@MDS:0]# mdsquerydb Gateways -f /tmp/gateways.txt
```

# mdsstart

## Description

Starts the Multi-Domain Server and all Domain Management Servers.

To start a specific Domain Management Server, see the ["mdsstart\\_customer" on page 774](#) command.

## Syntax

```
mdsstart [-m | -s]
```

## Parameters

| Parameter | Description                                                                                                                                                            |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -m        | <b>Optional:</b> Starts only the Multi-Domain Server and not the Domain Management Servers.                                                                            |
| -s        | <b>Optional:</b> Starts all the Domain Management Servers sequentially. The command waits for each Domain Management Server to come up, before it starts the next one. |

## Controlling the number of Domain Management Servers to start sequentially

By default, the system attempts to start up to 10 Domain Management Servers at the same time.

You can decrease the amount of time it takes to start the Multi-Domain Server when there are many Domain Management Servers.

To do this, set the value of the environment variable `NUM_EXEC_SIMUL` to the number of Domain Management Servers that start at the same time.

## Setting the environment variable 'NUM\_EXEC\_SIMUL' temporarily

This procedure configures the specified value for the environment variable `NUM_EXEC_SIMUL` in the current shell (does **not** survive reboot):

| Step | Instructions                                                                                                                                                                                                                           |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Connect to the command line on the Multi-Domain Server.                                                                                                                                                                                |
| 2    | Log in to the Expert mode.                                                                                                                                                                                                             |
| 3    | Set the value of the environment variable <code>NUM_EXEC_SIMUL</code> :<br><pre>[Expert@MDS:0]# export NUM_EXEC_SIMUL=&lt;Number of Domain Management Servers&gt;</pre> Example:<br><pre>[Expert@MDS:0]# export NUM_EXEC_SIMUL=5</pre> |
| 4    | Make sure the new value of the environment variable <code>NUM_EXEC_SIMUL</code> is set:<br><pre>[Expert@MDS:0]# echo \$NUM_EXEC_SIMUL</pre> Output must show the configured value.                                                     |

## Unsetting the environment variable 'NUM\_EXEC\_SIMUL' temporarily

This procedure removes the configured value for the environment variable `NUM_EXEC_SIMUL` in the current shell (does **not** survive reboot):

| Parameter | Description                                                                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1         | Connect to the command line on the Multi-Domain Server.                                                                                              |
| 2         | Log in to the Expert mode.                                                                                                                           |
| 3         | Unset the value of the environment variable <code>NUM_EXEC_SIMUL</code> :<br><pre>[Expert@MDS:0]# unset NUM_EXEC_SIMUL</pre>                         |
| 4         | Make sure the environment variable <code>NUM_EXEC_SIMUL</code> is not set:<br><pre>[Expert@MDS:0]# echo \$NUM_EXEC_SIMUL</pre> Output must be empty. |

## Setting the environment variable 'NUM\_EXEC\_SIMUL' permanently

This procedure configures the specified value for the environment variable `NUM_EXEC_SIMUL` for all shells (survives reboot):

| Step | Instructions                                                                                                                                                                                                                                                                                                                                       |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Connect to the command line on the Multi-Domain Server.                                                                                                                                                                                                                                                                                            |
| 2    | Log in to the Expert mode.                                                                                                                                                                                                                                                                                                                         |
| 3    | Back up the current <code>/etc/rc.d/rc.local</code> file:<br><pre>[Expert@MDS:0]# cp -v /etc/rc.d/rc.local{, _BKP}</pre>                                                                                                                                                                                                                           |
| 4    | Edit the current <code>/etc/rc.d/rc.local</code> file:<br><pre>[Expert@MDS:0]# vi /etc/rc.d/rc.local</pre>                                                                                                                                                                                                                                         |
| 5    | Add this line at the bottom of the file:<br><pre>export NUM_EXEC_SIMUL=&lt;Number of Domain Management Servers&gt;</pre> <p> <b>Important</b> - After this line, you must press Enter to add a new line.</p> <p>Example:</p> <pre>export NUM_EXEC_SIMUL=5</pre> |
| 6    | Save the changes in the file and exit the Vi editor.                                                                                                                                                                                                                                                                                               |
| 7    | Reboot.                                                                                                                                                                                                                                                                                                                                            |
| 8    | Make sure the new value of the environment variable <code>NUM_EXEC_SIMUL</code> is set:<br><pre>[Expert@MDS:0]# echo \$NUM_EXEC_SIMUL</pre> <p>Output must show the configured value.</p>                                                                                                                                                          |

## Unsetting the environment variable 'NUM\_EXEC\_SIMUL' permanently

This procedure removes the configured value for the environment variable `NUM_EXEC_SIMUL` for all shells (survives reboot):

| Step | Instructions                                                                                                                                                             |
|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Connect to the command line on the Multi-Domain Server.                                                                                                                  |
| 2    | Log in to the Expert mode.                                                                                                                                               |
| 3    | Back up the current <code>/etc/rc.d/rc.local</code> file:<br><pre>[Expert@MDS:0]# cp -v /etc/rc.d/rc.local{,_BKP_with_NUM_EXEC_SIMUL}</pre>                              |
| 4    | Edit the current <code>/etc/rc.d/rc.local</code> file:<br><pre>[Expert@MDS:0]# vi /etc/rc.d/rc.local</pre>                                                               |
| 5    | Remove this line from the file:<br><pre>export NUM_EXEC_SIMUL=&lt;Number of Domain Management Servers&gt;</pre>                                                          |
| 6    | Save the changes in the file and exit the Vi editor.                                                                                                                     |
| 7    | Reboot.                                                                                                                                                                  |
| 8    | Make sure the new value of the environment variable <code>NUM_EXEC_SIMUL</code> is not set:<br><pre>[Expert@MDS:0]# echo \$NUM_EXEC_SIMUL</pre><br>Output must be empty. |

# mdsstart\_customer

## Description

Starts the specified Domain Management Server, if it was stopped with the "[mdsstop\\_customer](#)" on page 781 command.

To start the entire Multi-Domain Server, see the "[mdsstart](#)" on page 770 command.

## Syntax

```
mdsstart_customer <IP address or Name of Domain Management Server>
```

 **Note** - If the name of the Domain Management Server includes spaces, you must surround it with quotes ("*Name of Domain Management Server*").

# mdsstat

## Description

This command shows the status of specific processes on the Multi-Domain Server and Domain Management Servers.

## Syntax

```
mdsstat [-h] [-m] [<Name or IP Address of Domain Management Server>]
```

## Parameters

| Parameter                                        | Description                                                         |
|--------------------------------------------------|---------------------------------------------------------------------|
| -h                                               | Displays help message.                                              |
| -m                                               | Test status for Multi-Domain Server only.                           |
| <Name or IP address of Domain Management Server> | Specifies the Domain Management Server by its name or IPv4 address. |

## Possible Statuses of Processes

| Status | Description                                               |
|--------|-----------------------------------------------------------|
| up     | The process is up.                                        |
| down   | The process is down.                                      |
| pnd    | The process is pending initialization.                    |
| init   | The process is initializing.                              |
| N/A    | The process's PID is not yet available.                   |
| N/R    | The process is not relevant for this Multi-Domain Server. |

## Example from a single Multi-Domain Security Management Server

```
[Expert@MDS:0]# mdsstat

CPM: Check Point Security Management Server is running and ready

```

# mdsstop

## Description

Stops the Multi-Domain Server and all Domain Management Servers.

To stop a specific Domain Management Server, see the ["mdsstop\\_customer" on page 781](#) command.

## Syntax

```
mdsstop [-m | -s]
```

## Parameters

| Parameter | Description                                                                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -m        | <b>Optional:</b> Stops only the Multi-Domain Server and not the Domain Management Servers.                                                                        |
| -s        | <b>Optional:</b> Stops all the Domain Management Servers sequentially. The command waits for each Domain Management Server to stop, before it stops the next one. |

## Controlling the number of Domain Management Servers to stop sequentially

By default, the system attempts to stop up to 10 Domain Management Servers at the same time.

You can decrease the amount of time it takes to stop the Multi-Domain Server when there are many Domain Management Servers.

To do this, set the value of the environment variable `NUM_EXEC_SIMUL` to the number of Domain Management Servers that stop at the same time.

## Setting the environment variable 'NUM\_EXEC\_SIMUL' temporarily

This procedure configures the specified value for the environment variable `NUM_EXEC_SIMUL` in the current shell (does **not** survive reboot):

| Step | Instructions                                                                                                                                                                                                                           |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Connect to the command line on the Multi-Domain Server.                                                                                                                                                                                |
| 2    | Log in to the Expert mode.                                                                                                                                                                                                             |
| 3    | Set the value of the environment variable <code>NUM_EXEC_SIMUL</code> :<br><pre>[Expert@MDS:0]# export NUM_EXEC_SIMUL=&lt;Number of Domain Management Servers&gt;</pre> Example:<br><pre>[Expert@MDS:0]# export NUM_EXEC_SIMUL=5</pre> |
| 4    | Make sure the new value of the environment variable <code>NUM_EXEC_SIMUL</code> is set:<br><pre>[Expert@MDS:0]# echo \$NUM_EXEC_SIMUL</pre> Output must show the configured value.                                                     |

## Unsetting the environment variable 'NUM\_EXEC\_SIMUL' temporarily

This procedure removes the configured value for the environment variable `NUM_EXEC_SIMUL` in the current shell (does **not** survive reboot):

| Parameter | Description                                                                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1         | Connect to the command line on the Multi-Domain Server.                                                                                              |
| 2         | Log in to the Expert mode.                                                                                                                           |
| 3         | Unset the value of the environment variable <code>NUM_EXEC_SIMUL</code> :<br><pre>[Expert@MDS:0]# unset NUM_EXEC_SIMUL</pre>                         |
| 4         | Make sure the environment variable <code>NUM_EXEC_SIMUL</code> is not set:<br><pre>[Expert@MDS:0]# echo \$NUM_EXEC_SIMUL</pre> Output must be empty. |

## Setting the environment variable 'NUM\_EXEC\_SIMUL' permanently

This procedure configures the specified value for the environment variable `NUM_EXEC_SIMUL` for all shells (survives reboot):

| Step | Instructions                                                                                                                                                                                                                                                                                                                                       |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Connect to the command line on the Multi-Domain Server.                                                                                                                                                                                                                                                                                            |
| 2    | Log in to the Expert mode.                                                                                                                                                                                                                                                                                                                         |
| 3    | Back up the current <code>/etc/rc.d/rc.local</code> file:<br><pre>[Expert@MDS:0]# cp -v /etc/rc.d/rc.local{, _BKP}</pre>                                                                                                                                                                                                                           |
| 4    | Edit the current <code>/etc/rc.d/rc.local</code> file:<br><pre>[Expert@MDS:0]# vi /etc/rc.d/rc.local</pre>                                                                                                                                                                                                                                         |
| 5    | Add this line at the bottom of the file:<br><pre>export NUM_EXEC_SIMUL=&lt;Number of Domain Management Servers&gt;</pre> <p> <b>Important</b> - After this line, you must press Enter to add a new line.</p> <p>Example:</p> <pre>export NUM_EXEC_SIMUL=5</pre> |
| 6    | Save the changes in the file and exit the Vi editor.                                                                                                                                                                                                                                                                                               |
| 7    | Reboot.                                                                                                                                                                                                                                                                                                                                            |
| 8    | Make sure the new value of the environment variable <code>NUM_EXEC_SIMUL</code> is set:<br><pre>[Expert@MDS:0]# echo \$NUM_EXEC_SIMUL</pre> <p>Output must show the configured value.</p>                                                                                                                                                          |

## Unsetting the environment variable 'NUM\_EXEC\_SIMUL' permanently

This procedure removes the configured value for the environment variable `NUM_EXEC_SIMUL` for all shells (survives reboot):

| Step | Instructions                                                                                                                                                             |
|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Connect to the command line on the Multi-Domain Server.                                                                                                                  |
| 2    | Log in to the Expert mode.                                                                                                                                               |

| 5    | Remove this line from the file:<br><pre>export NUM_EXEC_SIMUL=&lt;Number of Domain Management Servers&gt;</pre>                                                          |
| 6    | Save the changes in the file and exit the Vi editor.                                                                                                                     |
| 7    | Reboot.                                                                                                                                                                  |
| 8    | Make sure the new value of the environment variable <code>NUM_EXEC_SIMUL</code> is not set:<br><pre>[Expert@MDS:0]# echo \$NUM_EXEC_SIMUL</pre><br>Output must be empty. |

# mdsstop\_customer

## Description

Stops the specified Domain Management Server.

To stop the entire Multi-Domain Server, see the ["mdsstop" on page 777](#) command.

## Syntax

```
mdsstop_customer <IP address or Name of Domain Management Server>
```

### Notes:

- If the name of the Domain Management Server includes spaces, you must surround it with quotes ("*Name of Domain Management Server*").
- To start the specified Domain Management Server, run the ["mdsstart\\_customer" on page 774](#) command.

# mgmt\_cli

## Description

The `mgmt_cli` tool works directly with the management database on your Management Server.

## Syntax on Management Server or Security Gateway running on Gaia OS

```
mgmt_cli <Command Name> <Command Parameters> <Optional Switches>
```

## Syntax on SmartConsole computer running on Windows OS 32-bit

Open Windows Command Prompt and run these commands:

```
cd /d "%ProgramFiles%\CheckPoint\SmartConsole\<VERSION>\PROGRAM\"
mgmt_cli.exe <Command Name> <Command Parameters> <Optional
Switches>
```

## Syntax on SmartConsole computer running on Windows OS 64-bit

Open Windows Command Prompt and run these commands:

```
cd /d "%ProgramFiles
(x86)%\CheckPoint\SmartConsole\<VERSION>\PROGRAM\"
mgmt_cli.exe <Command Name> <Command Parameters> <Optional
Switches>
```

## Notes

- For a complete list of the `mgmt_cli` options, enter the `mgmt_cli (mgmt_cli.exe)` command and press Enter.
- For more information, see the [Check Point Management API Reference](#) (at the top, select the correct version) .

# migrate

**Important** - This command is used to migrate the management database from R80.10 and lower versions.

For more information, see the [R82.10 Installation and Upgrade Guide](#).

## Description

Exports the management database and applicable Check Point configuration.

Imports the exported management database and applicable Check Point configuration.

## **Backing up and restoring in Management High Availability environment:**

- To back up and restore a consistent environment, make sure to collect and restore the backups and snapshots from all servers in the High Availability environment at the same time.
- Make sure other administrators do not make changes in SmartConsole until the backup operation is completed.

For more information:

- About Gaia Backup and Gaia Snapshot, see the [R82.10 Gaia Administration Guide](#).
- About Virtual Machine Snapshots, see the vendor documentation.

## **Notes:**

- You must run this command from the Expert mode.
- If it is necessary to back up the current management database, and you do **not** plan to import it on a Management Server that runs a higher software version, then you can use the built-in command in the `$FWDIR/bin/upgrade_tools/` directory.
- If you plan to import the management database on a Management Server that runs a higher software version, then you must use the `migrate` utility from the migration tools package created specifically for that higher software version. See the **Installation and Upgrade Guide** for that higher software version.
- If this command completes successfully, it creates this log file:  
`/var/log/opt/CPshrd-R82.10/migrate-<YYYY.MM.DD_HH.MM.SS>.log`  
 For example: `/var/log/opt/CPshrd-R82.10/migrate-2019.06.14_11.03.46.log`
- If this command fails, it creates this log file:  
`$CPDIR/log/migrate-<YYYY.MM.DD_HH.MM.SS>.log`  
 For example: `/opt/CPshrd-R82.10/log/migrate-2019.06.14_11.21.39.log`

## Syntax

- To see the built-in help:

```
[Expert@MGMT:0]# ./migrate -h
```

- To export the management database and configuration:

```
[Expert@MGMT:0]# cd $FWDIR/bin/upgrade_tools/
[Expert@MGMT:0]# yes | nohup ./migrate export [-l | -x] [-n]
[--exclude-uepm-postgres-db] [--include-uepm-msi-files] /<Full
Path>/<Name of Exported File> &
```

- To import the management database and configuration:

```
[Expert@MGMT:0]# cd $FWDIR/bin/upgrade_tools/
[Expert@MGMT:0]# yes | nohup ./migrate import [-l | -x] [-n]
[--exclude-uepm-postgres-db] [--include-uepm-msi-files] /<Full
Path>/<Name of Exported File>.txz &
```

## Parameters

| Parameter                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -h                                | Shows the built-in help.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <i>&lt;Name of Exported File&gt;</i> | <ul style="list-style-type: none"> <li>During the export operation, specifies the name of the output file.<br/>The command automatically adds the *.txz extension.</li> <li>During the import operation, specifies the name of the exported file.<br/>You must manually enter the *.txz extension in the end.</li> </ul> |

### Example 1 - Export operation succeeded

```
[Expert@MGMT:0]# cd $FWDIR/bin/upgrade_tools/
[Expert@MGMT:0]# ./migrate export /var/log/Migrate_Export

You are required to close all clients to Security Management Server
or execute 'cpstop' before the Export operation begins.

Do you want to continue? (y/n) [n]? y

Copying required files...
Compressing files...

The operation completed successfully.

Location of archive with exported database: /var/log/Migrate_Export.txz

[Expert@MGMT:0]#
[Expert@MGMT:0]# find / -name migrate-\* -type f
/var/log/opt/CPshrd-R82.10/migrate-2019.06.14_11.03.46.log
[Expert@MGMT:0]#
```

### Example 2 - Export operation failed

```
[Expert@MGMT:0]# ./migrate export /var/log/My_Migrate_Export
Execution finished with errors. See log file '/opt/CPshrd-R82.10/log/migrate-2019.06.14_
11.21.39.log' for further details
[Expert@MGMT:0]#
```

# migrate\_server

**Important** - This command is used to migrate the management database from R80.20.M1, R80.20, R80.20.M2, R80.30, and higher versions.

For more information, see:

- [sk135172 - Upgrade Tools](#)
- The [R82.10 Installation and Upgrade Guide](#)

## Description

Exports the management database and applicable Check Point configuration.

Imports the exported management database and applicable Check Point configuration.

**Backing up and restoring in Management High Availability environment:**

- To back up and restore a consistent environment, make sure to collect and restore the backups and snapshots from all servers in the High Availability environment at the same time.
- Make sure other administrators do not make changes in SmartConsole until the backup operation is completed.

For more information:

- About Gaia Backup and Gaia Snapshot, see the [R82.10 Gaia Administration Guide](#).
- About Virtual Machine Snapshots, see the vendor documentation.

## Notes:

- You must run this command from the Expert mode.
- If it is necessary to back up the current management database, and you do **not** plan to import it on a Management Server that runs a higher software version, then you can use the built-in command in the `$FWDIR/scripts/` directory.
- If you plan to import the management database on a Management Server that runs a higher software version, then you must use the `migrate_server` utility from the migration tools package created specifically for that higher software version. See the **Installation and Upgrade Guide** for that higher software version.
- If this command completes successfully, it creates this log file:  
`/var/log/opt/CPshrd-R82.10/migrate-<YYYY.MM.DD_HH.MM.SS>.log`  
 For example: `/var/log/opt/CPshrd-R82.10/migrate-2022.06.14_11.03.46.log`
- If this command fails, it creates this log file:  
`$CPDIR/log/migrate-<YYYY.MM.DD_HH.MM.SS>.log`  
 For example: `/opt/CPshrd-R82.10/log/migrate-2025 - 2026.06.14_11.21.39.log`

 **Important** - If it is necessary to back up the current management database, and you do **not** plan to import it on a Management Server that runs a higher software version, then you must make sure the source Management Server and the target Management Server run the same Jumbo Hotfix Accumulator Take and all other private hotfixes.

To see all the installed software packages, you can run this command: `cpinfo -y all`

## Syntax

- To see the built-in help:

```
[Expert@MGMT:0]# cd $FWDIR/scripts/
[Expert@MGMT:0]# ./migrate_server -h
```

- To see the build number of the installed Upgrade Tools package:

```
[Expert@MGMT:0]# cd $FWDIR/scripts/
[Expert@MGMT:0]# ./migrate_server print_installed_tools -v
R82.10
```

- To run the Pre-Upgrade Verifier:

```
[Expert@MGMT:0]# cd $FWDIR/scripts/
[Expert@MGMT:0]# ./migrate_server verify -v R82.10 [-skip_
upgrade_tools_check]
```

- To export the management database and configuration:

```
[Expert@MGMT:0]# cd $FWDIR/scripts/
[Expert@MGMT:0]# ./migrate_server export -v R82.10 [-skip_
upgrade_tools_check] [-l | -x] [--include-uepm-msi-files] [--
exclude-uepm-postgres-db] [--ignore_warnings] /<Full
Path>/<Name of Exported File>
```

- To import the management database and configuration:

```
[Expert@MGMT:0]# cd $FWDIR/scripts/
[Expert@MGMT:0]# ./migrate_server import -v R82.10 [-skip_
upgrade_tools_check] [-l | -x] [/var/log/mdss.json] [--
include-uepm-msi-files] [--exclude-uepm-postgres-db] /<Full
Path>/<Name of Exported File>.tgz
```

- To import the Domain Management Server database and configuration on a Security Management Server:

```
[Expert@MGMT:0]# cd $FWDIR/scripts/
[Expert@MGMT:0]# ./migrate_server migrate_import_domain -v
R82.10 [-skip_upgrade_tools_check] [-l | -x]
[/var/log/mdss.json] [--include-uepm-msi-files] [--exclude-
uepm-postgres-db] /<Full Path>/<Name of Exported File>.tgz
```

## Parameters

| Parameter                                                  | Description                                                    |
|------------------------------------------------------------|----------------------------------------------------------------|
| -h                                                         | Shows the built-in help.                                       |
| <code>print_<br/>installed_<br/>tools -v<br/>R82.10</code> | Shows the build number of the installed Upgrade Tools package. |

| Parameter                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <code>-prepare_background</code>                          | Prepares upgrade in background.                                                                                                                                                                                                                                                                                                                                                         |
| <code>-cancel_prepare</code>                              | Cancels upgrade preparation.                                                                                                                                                                                                                                                                                                                                                            |
| <code>-grace_period &lt;Minutes&gt;</code>                | Grace period before starting upgrade completion.                                                                                                                                                                                                                                                                                                                                        |
| <code>-o &lt;Path to File&gt;</code>                      | Path to the archived file from which to import the database.                                                                                                                                                                                                                                                                                                                            |

| Parameter                                             | Description                                    |
|-------------------------------------------------------|------------------------------------------------|
| <code>-sn &lt;Name of Domain Server&gt;</code>        | Name of the Domain Management Server.          |
| <code>-dsi &lt;IP address of Domain Server&gt;</code> | IP address of the Management Server.           |
| <code>-skip_logs</code>                               | Skip the import of logs (without log indexes). |

### Example 1 - Export operation succeeded

```
[Expert@MGMT:0]# cd $FWDIR/scripts/
[Expert@MGMT:0]# ./migrate_server export -v R82.10 /var/log/Migrate_Export

You are required to close all clients to Security Management Server
or execute 'cpstop' before the Export operation begins.

Do you want to continue? (y/n) [n]? y

Copying required files...
Compressing files...

The operation completed successfully.

Location of archive with exported database: /var/log/Migrate_Export.tgz

[Expert@MGMT:0]#
[Expert@MGMT:0]# find / -name migrate-* -type f
/var/log/opt/CPshrd-R82.10/migrate-2025 - 2026.06.14_11.03.46.log
[Expert@MGMT:0]#
```

### Example 2 - Export operation failed

```
[Expert@MGMT:0]# ./migrate_server export /var/log/My_Migrate_Export
Execution finished with errors. See log file '/opt/CPshrd-R82.10/log/migrate-2025 - 2026.06.14_11.21.39.log' for further details
[Expert@MGMT:0]#
```

# migrate\_global\_policies

## Description

This utility transfers (and upgrades, if necessary) the global configuration database from one Multi-Domain Server to another Multi-Domain Server.

### Notes:

- You can only use this command when the target Multi-Domain Server does **not** have global configurations defined.
- This utility replaces all existing global configurations. Each existing global configuration is saved with a `*.pre_migrate` extension.
- If you migrate only the global configurations (without the Domain Management Servers) to a new Multi-Domain Server, disable all Security Gateways that are enabled for global use.

**Important** - You cannot export an R80.X global configuration database and then use this utility on an R80.X Multi-Domain Server.

## Syntax

```
migrate_global_policies <Path>
```

## Parameters

| Parameter | Description                                                                                                                                                                             |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <Path>    | The <b>fully qualified</b> path to the directory where the global policies files, originally exported from the source Multi-Domain Server ( <code>\$MDSDIR/conf/</code> ), are located. |

## Example

```
Expert@R82.10_MDS:0]# migrate_global_policies /var/log/exported_global_db.22Jul2019-124547.tgz
```

# queryDB\_util

## Description

Searches in the management database for objects or policy rules.

 **Important** - This command is obsolete for R80 and higher. Use the ["mgmt\\_cli" on page 386](#) command to search in the management database for objects or policy rules according to search parameters.

# rs\_db\_tool

## Description

Manages Dynamically Assigned IP address (DAIP) gateways in a DAIP database.

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

## Syntax

- **To add an entry to the DAIP database:**

```
[Expert@MGMT:0]# rs_db_tool [-d] -operation add -name <Object Name> -ip <IPv4 Address> -ip6 <Pv6 Address> -TTL <Time-To-Live>
```

- **To fetch a specific entry from the DAIP database:**

```
[Expert@MGMT:0]# rs_db_tool [-d] -operation fetch -name <Object Name>
```

- **To delete a specific entry from the DAIP database:**

```
[Expert@MGMT:0]# rs_db_tool [-d] -operation delete -name <Object Name>
```

- **To list all entries in the DAIP database:**

```
[Expert@MGMT:0]# rs_db_tool [-d] -operation list
```

- **To synchronize the DAIP database:**

```
[Expert@MGMT:0]# rs_db_tool [-d] -operation sync
```

**Note** - You must run this command from the Expert mode.

## Parameters

| Parameter           | Description                                                                                                                                                                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                  | <p>Runs the command in debug mode.<br/>Use only if you troubleshoot the command itself.</p> <p>★ <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> |
| -name <Object Name> | Specifies the name of the DAIP object.                                                                                                                                                                                                                               |
| -ip <IPv4 Address>  | Specifies the IPv4 address of the DAIP object                                                                                                                                                                                                                        |
| -ip6 <IPv6 Address> | Specifies the IPv6 address of the DAIP object.                                                                                                                                                                                                                       |
| -TTL <Time-To-Live> | Specifies the relative time interval (in seconds), during which the entry is valid.                                                                                                                                                                                  |

# sam\_alert

## Description

For SAM v1, this utility executes Suspicious Activity Monitoring (SAM) actions according to the information received from the standard input.

For SAM v2, this utility executes Suspicious Activity Monitoring (SAM) actions with User Defined Alerts mechanism.

### Important:

- You must run this command on the Management Server.
- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsend <IP Address or Name of Domain Management Server>
```

### Notes:

- VSX Gateways and VSX Cluster Members do **not** support Suspicious Activity Monitoring (SAM) Rules. See [sk79700](#).
- See the ["fw sam" on page 295](#) and ["fw sam\\_policy" on page 303](#) commands.

## SAM v1 syntax

```
sam_alert [-v] [-o] [-s <SAM Server>] [-t <Time>] [-f <Security Gateway>] [-C] {-n|-i|-I} {-src|-dst|-any|-srv}
```

## Parameters for SAM v1

| Parameter       | Description                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------------------|
| -v              | Enables the verbose mode for the "fw sam" command.                                                    |
| -o              | Specifies to print the input of this tool to the standard output (to use with pipes in a CLI syntax). |
| -s <SAM Server> | Specifies the SAM Server to be contacted. Default is "localhost".                                     |
| -t <Time>       | Specifies the time (in seconds), during which to enforce the action. The default is forever.          |

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -f<br><Security Gateway> | Specifies the Security Gateway / Cluster object, on which to run the operation.<br> <b>Important</b> - If you do not specify the target Security Gateway / Cluster object explicitly, this command applies to all managed Security Gateways and Clusters. |
| -C                       | Cancels the specified operation.                                                                                                                                                                                                                                                                                                           |
| -n                       | Specifies to notify every time a connection, which matches the specified criteria, passes through the Security Gateway / ClusterXL / Security Group.                                                                                                                                                                                       |
| -i                       | Inhibits (drops or rejects) connections that match the specified criteria.                                                                                                                                                                                                                                                                 |
| -I                       | Inhibits (drops or rejects) connections that match the specified criteria and closes all existing connections that match the specified criteria.                                                                                                                                                                                           |
| -src                     | Matches the source address of connections.                                                                                                                                                                                                                                                                                                 |
| -dst                     | Matches the destination address of connections.                                                                                                                                                                                                                                                                                            |
| -any                     | Matches either the source or destination address of connections.                                                                                                                                                                                                                                                                           |
| -srv                     | Matches specific source, destination, protocol and port.                                                                                                                                                                                                                                                                                   |

## SAM v2 syntax

```
sam_alert -v2 [-v] [-O] [-S <SAM Server>] [-t <Time>] [-f
<Security Gateway>] [-n <Name>] [-c "<Comment>"] [-o
<Originator>] [-l {r | a}] -a {d | r | n | b | q | i} [-C] {-ip
|-eth} {-src|-dst|-any|-srv}
```

## Parameters for SAM v2

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                  |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -v2                   | Specifies to use SAM v2.                                                                                                                                                                                                                                                                                                                     |
| -v                    | Enables the verbose mode for the "fw sam" command.                                                                                                                                                                                                                                                                                           |
| -O                    | Specifies to print the input of this tool to the standard output (to use with pipes in a CLI syntax).                                                                                                                                                                                                                                        |
| -S <SAM Server>       | Specifies the SAM server to be contacted. Default is "localhost".                                                                                                                                                                                                                                                                            |
| -t <Time>             | Specifies the time (in seconds), during which to enforce the action. The default is forever.                                                                                                                                                                                                                                                 |
| -f <Security Gateway> | Specifies the Security Gateway / Cluster object, on which to run the operation.<br> <b>Important</b> - If you do not specify the target Security Gateway / Cluster object explicitly, this command applies to all managed Security Gateways and Clusters. |
| -n <Name>             | Specifies the name for the SAM rule.<br>Default is empty.                                                                                                                                                                                                                                                                                    |
| -c "<Comment>"        | Specifies the comment for the SAM rule.<br>Default is empty.<br>You must enclose the text in the double quotes or single quotes.                                                                                                                                                                                                             |
| -o <Originator>       | Specifies the originator for the SAM rule.<br>Default is "sam_alert".                                                                                                                                                                                                                                                                        |

| Parameter                               | Description                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-l {r   a}</code>                 | <p>Specifies the log type for connections that match the specified criteria:</p> <ul style="list-style-type: none"> <li>▪ <code>r</code> - Regular</li> <li>▪ <code>a</code> - Alert</li> </ul> <p>Default is <code>None</code>.</p>                                                                                                                 |
| <code>-a {d   r   n   b   q   i}</code> | <p>Specifies the action to apply on connections that match the specified criteria:</p> <ul style="list-style-type: none"> <li>▪ <code>d</code> - Drop</li> <li>▪ <code>r</code> - Reject</li> <li>▪ <code>n</code> - Notify</li> <li>▪ <code>b</code> - Bypass</li> <li>▪ <code>q</code> - Quarantine</li> <li>▪ <code>i</code> - Inspect</li> </ul> |
| <code>-C</code>                         | Specifies to close all existing connections that match the criteria.                                                                                                                                                                                                                                                                                 |
| <code>-ip</code>                        | Specifies to use IP addresses as criteria parameters.                                                                                                                                                                                                                                                                                                |
| <code>-eth</code>                       | Specifies to use MAC addresses as criteria parameters.                                                                                                                                                                                                                                                                                               |
| <code>-src</code>                       | Matches the source address of connections.                                                                                                                                                                                                                                                                                                           |
| <code>-dst</code>                       | Matches the destination address of connections.                                                                                                                                                                                                                                                                                                      |
| <code>-any</code>                       | Matches either the source or destination address of connections.                                                                                                                                                                                                                                                                                     |
| <code>-srv</code>                       | Matches specific source, destination, protocol and port.                                                                                                                                                                                                                                                                                             |

## Example

See [sk110873: How to configure Security Gateway to detect and prevent port scan](#).

# stattest

## Description

Check Point AMON client to query SNMP OIDs.

You can use this command as an alternative to the standard SNMP commands for debug purposes - to make sure the applicable SNMP OIDs provide the requested information.

### Notes:

- You can run this command only in the Expert mode.
- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsensv <IP Address or Name of Domain Management Server>
```

## Syntax to query a Regular OID

- On a Management Server / Security Gateway / Cluster Member:

```
stattest get [-d] [-h <Host>] [-p <Port>] [-x <Proxy Server>] [-v <VSID>] [-t <Timeout>] <Regular_OID_1> <Regular_OID_2> ...  
<Regular_OID_N>
```

- On a Scalable Platform Security Group:

```
g_all stattest get [-d] [-h <Host>] [-p <Port>] [-x <Proxy Server>] [-v <VSID>] [-t <Timeout>] <Regular_OID_1> <Regular_OID_2>  
... <Regular_OID_N>
```

### Notes:

- These Regular OIDs are specified in the SNMP MIB files.
- For Check Point MIB files, see [sk90470](#).

## Syntax to query a Statistical OID

- On a Management Server / Security Gateway / Cluster Member:

```
stattest get [-d] [-h <Host>] [-p <Port>] [-x <Proxy Server>] -l <Polling Interval> -r <Polling Duration> [-v <VSID>] [-t <Timeout>] <Statistical_OID_1> <Statistical_OID_2> ... <Statistical_OID_N>
```

- On a Scalable Platform Security Group:

```
g_all stattest get [-d] [-h <Host>] [-p <Port>] [-x <Proxy Server>] -l <Polling Interval> -r <Polling Duration> [-v <VSID>] [-t <Timeout>] <Statistical_OID_1> <Statistical_OID_2> ... <Statistical_OID_N>
```

### Notes:

- These Statistical OIDs take some time to "initialize".
- For example, to calculate an average, it is necessary to collect enough samples.
- Check Point statistical OIDs are registered in the `$CPDIR/conf/statistical_oid.conf` file.

### Parameters

| Parameter                                | Description                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-d</code>                          | <p>Runs the command in debug mode. Use only if you troubleshoot the command itself.</p> <p> <b>Best Practice</b> - If you use this parameter, then redirect the output to a file, or use the <a href="#">script</a> command to save the entire CLI session.</p> |
| <code>-h &lt;Host&gt;</code>             | <p>Specifies the remote Check Point host to query by its IP address or resolvable hostname.</p>                                                                                                                                                                                                                                                    |
| <code>-p &lt;Port&gt;</code>             | <p>Specifies the port number, on which the AMON server listens. Default port is 18192.</p>                                                                                                                                                                                                                                                         |
| <code>-x &lt;Proxy Server&gt;</code>     | <p>Specifies the Proxy Server by its IP address or resolvable hostname.</p> <p> <b>Note</b> - Use only when you query a remote host.</p>                                                                                                                        |
| <code>-l &lt;Polling Interval&gt;</code> | <p>Specifies the time in seconds between queries.</p> <p> <b>Note</b> - Use only when you query a Statistical OID.</p>                                                                                                                                          |

### Example - Query a Regular OID

Query the CPU Idle utilization at the OID 1.3.6.1.4.1.2620.1.6.7.2.3 (`procIdleTime`).

```
[Expert@HostName]# stattest get 1.3.6.1.4.1.2620.1.6.7.4.2
```

### Example - Query a Statistical OID

Query the CPU Idle utilization at the OID 1.3.6.1.4.1.2620.1.6.7.2.3 (`procIdleTime`).

Information is collected with intervals of 5 seconds during 5 seconds

```
[Expert@HostName]# stattest get -l 5 -r 5 1.3.6.1.4.1.2620.1.6.7.2.3
```

# threshold\_config

## Description

You can configure a variety of different SNMP thresholds that generate SNMP traps, or alerts.

You can use these thresholds to monitor many system components automatically without requesting information from each object or device.

You configure these SNMP Monitoring Thresholds only on the Security Management Server, Multi-Domain Server, or Domain Management Server.

During policy installation, the managed a Security Gateway and Clusters receive and apply these thresholds as part of their policy.

For more information, see [sk90860: How to configure SNMP on Gaia OS](#).

## Procedure

| Step | Instructions                                                                                                                                                                                 |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Connect to the command line on the Management Server.                                                                                                                                        |
| 2    | Log in to the Expert mode.                                                                                                                                                                   |
| 3    | On a Multi-Domain Server, switch to the context of the applicable Domain Management Server:<br><pre>[Expert@HostName:0]# mdsenv &lt;Name or IP address of Domain Management Server&gt;</pre> |
| 4    | Go to the Threshold Engine Configuration menu:<br><pre>[Expert@HostName:0]# threshold_config</pre>                                                                                           |

| Step | Instructions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5    | <p>Select the applicable options and configure the applicable settings (see the <b>Threshold Engine Configuration Options</b> table below).</p> <div data-bbox="319 309 1460 936"> <pre>Threshold Engine Configuration Options: -----  (1) Show policy name (2) Set policy name (3) Save policy (4) Save policy to file (5) Load policy from file (6) Configure global alert settings (7) Configure alert destinations (8) View thresholds overview (9) Configure thresholds  (e) Exit (m) Main Menu  Enter your choice (1-9) :</pre> </div> |

### Thresholds Categories

| Category                      | Sub-Categories                                                                                                                                                                               |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| (1) Hardware                  | <pre> Hardware Thresholds: ----- (1) RAID volume state (2) RAID disk state (3) RAID disk flags (4) Temperature sensor reading (5) Fan speed sensor reading (6) Voltage sensor reading </pre> |
| (2) High Availability         | <pre> High Availability Thresholds: ----- (1) Cluster member state changed (2) Cluster block state (3) Cluster state (4) Cluster problem status (5) Cluster interface status </pre>          |
| (3) Local Logging Mode Status | <pre> Local Logging Mode Status Thresholds: ----- (1) Local Logging Mode </pre>                                                                                                              |
| (4) Log Server Connectivity   | <pre> Log Server Connectivity Thresholds: ----- (1) Connection with log server (2) Connection with all log servers </pre>                                                                    |

| Category       | Sub-Categories                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| (5) Networking | <p>Networking Thresholds:</p> <p>-----</p> <ul style="list-style-type: none"> <li>(1) Interface Admin Status</li> <li>(2) Interface removed</li> <li>(3) Interface Operational Link Status</li> <li>(4) New connections rate</li> <li>(5) Concurrent connections rate</li> <li>(6) Bytes Throughput</li> <li>(7) Accepted Packet Rate</li> <li>(8) Drop caused by excessive traffic</li> </ul> |
| (6) Resources  | <p>Resources Thresholds:</p> <p>-----</p> <ul style="list-style-type: none"> <li>(1) Swap Memory Utilization</li> <li>(2) Real Memory Utilization</li> <li>(3) Partition free space</li> <li>(4) Core Utilization</li> <li>(5) Core interrupts rate</li> </ul>                                                                                                                                 |

**Notes:**

- If you run the `threshold_config` command *locally* on a Security Gateway or Cluster Members to configure the SNMP Monitoring Thresholds, then each policy installation erases these *local* SNMP threshold settings and reverts them to the *global* SNMP threshold settings configured on the Management Server that manages this Security Gateway or Cluster.
- On a Security Gateway and Cluster Members, you can save the local Threshold Engine Configuration settings to a file and load it locally later.
- The Threshold Engine Configuration is stored in the `$FWDIR/conf/thresholds.conf` file.
- In a Multi-Domain Security Management environment:
  - You can configure the SNMP thresholds in the context of Multi-Domain Server (MDS) and in the context of each individual Domain Management Server.
  - Thresholds that you configure in the context of the Multi-Domain Server are for the Multi-Domain Server only.
  - Thresholds that you configure in the context of a Domain Management Server are for that Domain Management Server and its managed Security Gateway and Clusters.
  - If an SNMP threshold applies both to the Multi-Domain Server and a Domain Management Server, then configure the SNMP threshold both in the context of the Multi-Domain Server and in the context of the Domain Management Server.  
However, in this scenario you can only get alerts from the Multi-Domain Server, if the monitored object exceeds the threshold.  
Example:  
If you configure the CPU threshold, then when the monitored value exceeds the configured threshold, it applies to both the Multi-Domain Server and the Domain Management Server. However, only the Multi-Domain Server generates SNMP alerts.

# \$MDSVERUTIL

## Description

This utility returns information about the Multi-Domain Server and Domain Management Servers.

This utility is intended for internal use by Check Point scripts on the Multi-Domain Server.

You can use this utility to get some information about the Multi-Domain Server and Domain Management Servers (for example, the names of all Domain Management Servers).

## Syntax

|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>CMALogIndexerDir &lt;options&gt;</code> | Returns the full path for the <code>\$INDEXERDIR</code> directory in the context of the specified Domain Management Server.<br>See " <a href="#">\$MDSVERUTIL CMALogIndexerDir</a> " on page 839.    |
| <code>CMANameByFwDir &lt;options&gt;</code>   | Returns the name of the Domain Management Server based on the context of the current <code>\$FWDIR</code> directory.<br>See " <a href="#">\$MDSVERUTIL CMANameByFwDir</a> " on page 840.             |
| <code>CMANameByIp &lt;options&gt;</code>      | Returns the name of the Domain Management Server based on the specified IPv4 address.<br>See " <a href="#">\$MDSVERUTIL CMANameByIp</a> " on page 841.                                               |
| <code>CMARegistryDir &lt;options&gt;</code>   | Returns the full path for the <code>\$CPDIR/registry/</code> directory in the context of the specified Domain Management Server.<br>See " <a href="#">\$MDSVERUTIL CMARegistryDir</a> " on page 842. |
| <code>CMAReporterDir &lt;options&gt;</code>   | Returns the full path for the <code>\$RTDIR</code> directory in the context of the specified Domain Management Server.<br>See " <a href="#">\$MDSVERUTIL CMAReporterDir</a> " on page 843.           |
| <code>CMASmartLogDir &lt;options&gt;</code>   | Returns the full path for the <code>\$SMARTLOGDIR</code> directory in the context of the specified Domain Management Server.<br>See " <a href="#">\$MDSVERUTIL CMASmartLogDir</a> " on page 844.     |
| <code>CMASvnConfDir &lt;options&gt;</code>    | Returns the full path for the <code>\$CPDIR/conf/</code> directory in the context of the specified Domain Management Server.<br>See " <a href="#">\$MDSVERUTIL CMASvnConfDir</a> " on page 845.      |
| <code>CMASvnDir &lt;options&gt;</code>        | Returns the full path for the <code>\$CPDIR</code> directory in the context of the specified Domain Management Server.<br>See " <a href="#">\$MDSVERUTIL CMASvnDir</a> " on page 846.                |

| Parameter                                       | Description                                                                                                                                                                                         |
|-------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ConfDirVersion &lt;options&gt;</code>     | Returns the internal Version ID based on the context of the current <code>\$FWDIR/conf/</code> directory.<br>See " <a href="#">\$MDSVERUTIL ConfDirVersion</a> " on page 847.                       |
| <code>CpdbUpParam &lt;options&gt;</code>        | Returns internal version numbers from the internal database.<br>See " <a href="#">\$MDSVERUTIL CpdbUpParam</a> " on page 848.                                                                       |
| <code>CPprofileDir &lt;options&gt;</code>       | Returns the path to the directory that contains the <code>.CPprofile.sh</code> and the <code>.CPprofile.csh</code> shell scripts.<br>See " <a href="#">\$MDSVERUTIL CPprofileDir</a> " on page 849. |
| <code>CPVer &lt;options&gt;</code>              | Returns internal Check Point version number.<br>See " <a href="#">\$MDSVERUTIL CPVer</a> " on page 850.                                                                                             |
| <code>CustomersBaseDir &lt;options&gt;</code>   | Returns the full path for the <code>\$MDSDIR/customers/</code> directory.<br>See " <a href="#">\$MDSVERUTIL CustomersBaseDir</a> " on page 851.                                                     |
| <code>DiskSpaceFactor &lt;options&gt;</code>    | Returns the disk-space factor (the <code>mds_setup</code> command uses this value during an upgrade).<br>See " <a href="#">\$MDSVERUTIL DiskSpaceFactor</a> " on page 852.                          |
| <code>InstallationLogDir &lt;options&gt;</code> | Returns the full path for directory with all installation logs ( <code>/opt/CPInstLog/</code> ).<br>See " <a href="#">\$MDSVERUTIL InstallationLogDir</a> " on page 853.                            |
| <code>IsIPv6Enabled</code>                      | Returns <code>true</code> , if IPv6 is enabled in Gaia OS.<br>Returns <code>false</code> , if IPv6 is disabled in Gaia OS.<br>See " <a href="#">\$MDSVERUTIL IsIPv6Enabled</a> " on page 854.       |
| <code>IsLegalVersion &lt;options&gt;</code>     | Returns 0, if the specified internal Version ID is legal.<br>Returns 1, if the specified internal Version ID is illegal.<br>See " <a href="#">\$MDSVERUTIL IsLegalVersion</a> " on page 855.        |

| Parameter                                      | Description                                                                                                                                                                                               |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>IsOsSupportsIPv6</code>                  | Returns <code>true</code> , if the OS supports IPv6.<br>Returns <code>false</code> , if the OS does not support IPv6.<br>See " <a href="#">\$MDSVERUTIL IsOsSupportsIPv6</a> " on page 856.               |
| <code>LatestVersion</code>                     | Returns the internal Version ID of the latest installed version.<br>See " <a href="#">\$MDSVERUTIL LatestVersion</a> " on page 857.                                                                       |
| <code>MDSAddonDir &lt;options&gt;</code>       | Returns the path to the Management Addon directory in the MDS context.<br>See " <a href="#">\$MDSVERUTIL MDSAddonDir</a> " on page 858.                                                                   |
| <code>MDSCompDir &lt;options&gt;</code>        | Returns the full path for the specified Backward Compatibility Package in the MDS context.<br>See " <a href="#">\$MDSVERUTIL MDSCompDir</a> " on page 859.                                                |
| <code>MDSDir &lt;options&gt;</code>            | Returns the full path in the <code>/opt/</code> directory to the <code>\$MDSDIR</code> directory.<br>See " <a href="#">\$MDSVERUTIL MDSDir</a> " on page 860.                                             |
| <code>MDSFgDir &lt;options&gt;</code>          | Returns the full path for the <code>\$FGDIR</code> directory in the MDS context.<br>See " <a href="#">\$MDSVERUTIL MDSFgDir</a> " on page 861.                                                            |
| <code>MDSFwbcDir &lt;options&gt;</code>        | Returns the full path in the <code>/opt/</code> directory (in the MDS context) for the Backward Compatibility directory for Edge devices.<br>See " <a href="#">\$MDSVERUTIL MDSFwbcDir</a> " on page 862. |
| <code>MDSFwDir &lt;options&gt;</code>          | Returns the full path in the <code>/opt/</code> directory for the <code>\$FWDIR</code> directory in the MDS context.<br>See " <a href="#">\$MDSVERUTIL MDSFwDir</a> " on page 863.                        |
| <code>MDSIp &lt;options&gt;</code>             | Returns the IPv4 address of Multi-Domain Server.<br>See " <a href="#">\$MDSVERUTIL MDSIp</a> " on page 864.                                                                                               |
| <code>MDSIp6 &lt;options&gt;</code>            | Returns the IPv6 address of Multi-Domain Server.<br>See " <a href="#">\$MDSVERUTIL MDSIp6</a> " on page 865.                                                                                              |
| <code>MDSLogExporterDir &lt;options&gt;</code> | Returns the full path for the <code>\$EXPORTERDIR</code> directory in the MDS context.<br>See " <a href="#">\$MDSVERUTIL MDSLogExporterDir</a> " on page 866.                                             |

| Parameter                  | Description                                                                                                                                                                                         |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MDSLogIndexerDir <options> | Returns the full path for the \$INDEXERDIR directory in the MDS context.<br>See " <a href="#">\$MDSVERUTIL MDSLogIndexerDir</a> " on page 867.                                                      |
| MDSPkgName <options>       | Returns the name of the MDS software package.<br>See " <a href="#">\$MDSVERUTIL MDSPkgName</a> " on page 868.                                                                                       |
| MDSRegistryDir <options>   | Returns the full path for the \$CPDIR/registry/ directory in the MDS context.<br>See " <a href="#">\$MDSVERUTIL MDSRegistryDir</a> " on page 869.                                                   |
| MDSReporterDir <options>   | Returns the full path for the \$RTDIR directory in the MDS context.<br>See " <a href="#">\$MDSVERUTIL MDSReporterDir</a> " on page 870.                                                             |
| MDSSmartLogDir <options>   | Returns the full path for the \$SMARTLOGDIR directory in the MDS context.<br>See " <a href="#">\$MDSVERUTIL MDSSmartLogDir</a> " on page 871.                                                       |
| MDSSvnDir <options>        | Returns the full path in the /opt/ directory for the \$CPDIR directory in the MDS context.<br>See " <a href="#">\$MDSVERUTIL MDSSvnDir</a> " on page 872.                                           |
| MDSVarCompDir <options>    | Returns the full path in the /var/opt/ directory for the specified Backward Compatibility Package in the MDS context.<br>See " <a href="#">\$MDSVERUTIL MDSVarCompDir</a> " on page 873.            |
| MDSVarDir <options>        | Returns the full path in the /var/opt/ directory to the \$MDSDIR directory.<br>See " <a href="#">\$MDSVERUTIL MDSVarCompDir</a> " on page 873.                                                      |
| MDSVarFwbcDir <options>    | Returns the full path in the /var/opt/ directory (in the MDS context) for the Backward Compatibility directory for Edge devices.<br>See " <a href="#">\$MDSVERUTIL MDSVarFwbcDir</a> " on page 875. |

| Parameter                            | Description                                                                                                                                                                       |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MDSVarFwDir <options>                | Returns the full path in the /var/opt/ directory for the \$FWDIR directory in the MDS context.<br>See " <a href="#">\$MDSVERUTIL MDSVarFwDir</a> " on page 876.                   |
| MDSVarSvnDir <options>               | Returns the full path in the /var/opt/ directory for the \$CPDIR directory in the MDS context.<br>See " <a href="#">\$MDSVERUTIL MDSVarSvnDir</a> " on page 877.                  |
| MSP <options>                        | Returns the Minor Service Pack version.<br>See " <a href="#">\$MDSVERUTIL MSP</a> " on page 878.                                                                                  |
| OfficialName <options>               | Returns the official version name.<br>See " <a href="#">\$MDSVERUTIL OfficialName</a> " on page 879.                                                                              |
| OptionPack <options>                 | Returns the internal Option Pack version.<br>See " <a href="#">\$MDSVERUTIL OptionPack</a> " on page 880.                                                                         |
| ProductName <options>                | Returns the official name of the Multi-Domain Server product.<br>See " <a href="#">\$MDSVERUTIL ProductName</a> " on page 881.                                                    |
| RegistryCurrentVer <options>         | Returns the current internal version of Check Point Registry.<br>See " <a href="#">\$MDSVERUTIL RegistryCurrentVer</a> " on page 882.                                             |
| ShortOfficialName <options>          | Returns the short (without spaces) official version name.<br>See " <a href="#">\$MDSVERUTIL ShortOfficialName</a> " on page 883.                                                  |
| SmartCenterPuvUpgradeParam <options> | Returns the version to the Pre-Upgrade Verifier (PUV) in order for it to upgrade to that version.<br>See " <a href="#">\$MDSVERUTIL SmartCenterPuvUpgradeParam</a> " on page 884. |
| SP <options>                         | Returns the Service Pack version.<br>See " <a href="#">\$MDSVERUTIL SP</a> " on page 885.                                                                                         |
| SVNPkgName <options>                 | Returns the name of the Secure Virtual Network (SVN) package.<br>See " <a href="#">\$MDSVERUTIL SVNPkgName</a> " on page 886.                                                     |

| Parameter              | Description                                                                                                              |
|------------------------|--------------------------------------------------------------------------------------------------------------------------|
| SvrDirectory <options> | Returns the full path for the SmartReporter directory.<br>See " <a href="#">\$MDSVERUTIL SvrDirectory</a> " on page 887. |
| SvrParam <options>     | Returns the SmartReporter version.<br>See " <a href="#">\$MDSVERUTIL SvrParam</a> " on page 888.                         |

# \$MDSVERUTIL AllCMAs

## Description

Returns the list of names of the configured Domain Management Servers.

## Syntax

```
$MDSVERUTIL AllCMAs [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL AllCMAs
MyDomain_Server_1
MyDomain_Server_2
MyDomain_Server_3
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL AllCMAs -v VID_92
MyDomain_Server_1
MyDomain_Server_2
MyDomain_Server_3
[Expert@MDS:0]#
```

# \$MDSVERUTIL AllVersions

## Description

Returns the internal representation of versions, this Multi-Domain Server recognizes.

You can use these internal version strings in other commands.

In addition, see these commands:

- ["\\$MDSVERUTIL IsLegalVersion" on page 855](#)
- ["\\$MDSVERUTIL OfficialName" on page 879](#)

## Syntax

```
$MDSVERUTIL AllVersions
```

**Mapping**

| Internal Version ID | Official version                  |
|---------------------|-----------------------------------|
| VID_94              | R80.40                            |

# \$MDSVERUTIL CMAAddonDir

## Description

Returns the path to the Management Addon directory in the context of the specified Domain Management Server. Applies only to NG AI R55W version.

In addition, see the ["\\$MDSVERUTIL MDSAddonDir" on page 858](#) command.

## Syntax

```
$MDSVERUTIL CMAAddonDir -n <Name or IP address of Domain Management Server> [-v <Version_ID>]
```

## Parameters

| Parameter                                           | Description                                                                                                |
|-----------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| -n <Name or IP address of Domain Management Server> | Specifies the Domain Management Server by its name or IPv4 address.                                        |
| -v <Version_ID>                                     | Specifies the internal Version ID. See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example

```
[Expert@MDS:0]# $MDSVERUTIL CMAAddonDir -n MyDomain_Server
/opt/CPmds-R82.10/customers/MyDomain_Server/CPmgmt-R55W
[Expert@MDS:0]#
```

# \$MDSVERUTIL CMACompDir

## Description

Returns the full path for the specified Backward Compatibility Package in the context of the specified Domain Management Server.

In addition, see these commands:

- ["\\$MDSVERUTIL MDSCompDir" on page 859](#)
- ["\\$MDSVERUTIL MDSVarCompDir" on page 873](#)

## Syntax

```
$MDSVERUTIL CMACompDir -n <Name or IP address of Domain Management Server> -c <Name of Backward Compatibility Package>
```

## Parameters

| Parameter                                                              | Description                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-n &lt;Name or IP address of Domain Management Server&gt;</code> | Specifies the Domain Management Server by its name or IPv4 address.                                                                                                                                                                                                                                                                                                                                  |
| <code>-c &lt;Name of Backward Compatibility Package&gt;</code>         | Specifies the name of Backward Compatibility Package. The Backward Compatibility Package contains the applicable files to install policy on Security Gateways that run a lower version than the Multi-Domain Server. To see the list of all Backward Compatibility Packages, run in Expert mode: <div><pre>ls -l \$MDSDIR/customers/&lt;Name of Domain Management Server&gt;/   grep CMP</pre></div> |

## Example

```
[Expert@MDS:0]# $MDSVERUTIL CMACompDir -n MyDomain_Server -c CPR77CMP-R82.10 /opt/CPmds-R82.10/customers/MyDomain_Server/CPR77CMP-R82.10
[Expert@MDS:0]#
```

# \$MDSVERUTIL CMAFgDir

## Description

Returns the full path for the `$FGDIR` directory in the context of the specified Domain Management Server.

In addition, see the ["\\$MDSVERUTIL MDSFgDir" on page 861](#) command.

## Syntax

```
$MDSVERUTIL CMAFgDir -n <Name or IP address of Domain Management Server> [-v <Version_ID>]
```

## Parameters

| Parameter                                                              | Description                                                                                                |
|------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| <code>-n &lt;Name or IP address of Domain Management Server&gt;</code> | Specifies the Domain Management Server by its name or IPv4 address.                                        |
| <code>-v &lt;Version_ID&gt;</code>                                     | Specifies the internal Version ID. See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL CMAFgDir -n MyDomain_Server
/opt/CPmds-R82.10/customers/MyDomain_Server/CPsuite-R82.10/fg1
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL CMAFgDir -n MyDomain_Server -v VID_90
/opt/CPmds-R77/customers/MyDomain_Server/CPsuite-R77/fg1
[Expert@MDS:0]#
```

# \$MDSVERUTIL CMAFw40Dir

## Description

Returns the full path for the `$FWDIR` directory for FireWall-1 4.0 in the context of the specified Domain Management Server.

## Syntax

```
$MDSVERUTIL CMAFw40Dir -n <Name or IP address of Domain Management Server> [-v <Version_ID>]
```

## Parameters

| Parameter                                                              | Description                                                                                                                  |
|------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <code>-n &lt;Name or IP address of Domain Management Server&gt;</code> | Specifies the Domain Management Server by its name or IPv4 address.                                                          |
| <code>-v &lt;Version_ID&gt;</code>                                     | Specifies the internal Version ID. See the " <a href="#">\$MDSVERUTIL AllVersions</a> " on <a href="#">page 826</a> command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL CMAFw40Dir -n MyDomain_Server
/opt/CPmds-R82.10/customers/MyDomain_Server/fw40
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL CMAFw40Dir -n MyDomain_Server -v VID_90
/opt/CPmds-R77/customers/MyDomain_Server/fw40
[Expert@MDS:0]#
```

# \$MDSVERUTIL CMAFw41Dir

 **Note** - R82.10 does not support UTM-1 Edge and Safe@Office devices. The information about this command is provided only to describe the existing syntax option until it is removed completely.

## Description

Returns the full path for the `$FWDIR` directory for UTM-1 Edge devices (that are based on FireWall-1 4.1) in the context of the specified Domain Management Server.

## Syntax

```
$MDSVERUTIL CMAFw41Dir -n <Name or IP address of Domain Management Server> [-v <Version_ID>]
```

## Parameters

| Parameter                                                              | Description                                                                                                                  |
|------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <code>-n &lt;Name or IP address of Domain Management Server&gt;</code> | Specifies the Domain Management Server by its name or IPv4 address.                                                          |
| <code>-v &lt;Version_ID&gt;</code>                                     | Specifies the internal Version ID. See the " <a href="#">\$MDSVERUTIL AllVersions</a> " on <a href="#">page 826</a> command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL CMAFw41Dir -n MyDomain_Server
/opt/CPmds-R82.10/customers/MyDomain_Server/CPEdgecmp-R82.10
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL CMAFw41Dir -n MyDomain_Server -v VID_90
/opt/CPmds-R77/customers/MyDomain_Server/CPEdgecmp-R77
[Expert@MDS:0]#
```

# \$MDSVERUTIL CMAFwConfDir

## Description

Returns the full path for the `$FWDIR/conf/` directory in the context of the specified Domain Management Server.

## Syntax

```
$MDSVERUTIL CMAFwConfDir -n <Name or IP address of Domain Management Server> [-v <Version_ID>]
```

## Parameters

| Parameter                                                              | Description                                                                                                                  |
|------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <code>-n &lt;Name or IP address of Domain Management Server&gt;</code> | Specifies the Domain Management Server by its name or IPv4 address.                                                          |
| <code>-v &lt;Version_ID&gt;</code>                                     | Specifies the internal Version ID. See the " <a href="#">\$MDSVERUTIL AllVersions</a> " on <a href="#">page 826</a> command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL CMAFwConfDir -n MyDomain_Server  
/opt/CPmds-R82.10/customers/MyDomain_Server/CPsuite-R82.10/fw1/conf  
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL CMAFwConfDir -n MyDomain_Server -v VID_90  
/opt/CPmds-R77/customers/MyDomain_Server/CPsuite-R77/fw1/conf  
[Expert@MDS:0]#
```

# \$MDSVERUTIL CMAFwDir

## Description

Returns the full path for the `$FWDIR` directory in the context of the specified Domain Management Server.

In addition, see the ["\\$MDSVERUTIL MDSFwDir" on page 863](#) command.

## Syntax

```
$MDSVERUTIL CMAFwDir -n <Name or IP address of Domain Management Server> [-v <Version_ID>]
```

## Parameters

| Parameter                                                              | Description                                                                                                |
|------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| <code>-n &lt;Name or IP address of Domain Management Server&gt;</code> | Specifies the Domain Management Server by its name or IPv4 address.                                        |
| <code>-v &lt;Version_ID&gt;</code>                                     | Specifies the internal Version ID. See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL CMAFwDir -n MyDomain_Server  
/opt/CPmds-R82.10/customers/MyDomain_Server/CPsuite-R82.10/fw1  
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL CMAFwDir -n MyDomain_Server -v VID_90  
/opt/CPmds-R77/customers/MyDomain_Server/CPsuite-R77/fw1  
[Expert@MDS:0]#
```

# \$MDSVERUTIL CMAIp

## Description

Returns the IPv4 address of the Domain Management Server specified by its name.

In addition, see the "[\\$MDSVERUTIL MDSIp](#)" on [page 864](#) command.

## Syntax

```
$MDSVERUTIL CMAIp -n <Name or IP address of Domain Management Server> [-v <Version_ID>]
```

## Parameters

| Parameter                                                              | Description                                                                                                                     |
|------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <code>-n &lt;Name or IP address of Domain Management Server&gt;</code> | Specifies the Domain Management Server by its name or IPv4 address.                                                             |
| <code>-v &lt;Version_ID&gt;</code>                                     | Specifies the internal Version ID.<br>See the " <a href="#">\$MDSVERUTIL AllVersions</a> " on <a href="#">page 826</a> command. |

## Example

```
[Expert@MDS:0]# $MDSVERUTIL CMAIp -n MyDomain_Server
192.168.3.240
[Expert@MDS:0]#
```

# \$MDSVERUTIL CMAIp6

## Description

Returns the IPv6 address of the Domain Management Server specified by its name.

In addition, see the "[\\$MDSVERUTIL MDSIp6](#)" on [page 865](#) command.

To configure an IPv6 address on a Multi-Domain Security Management Server, see the [R82.10 Gaia Administration Guide](#).

## Syntax

```
$MDSVERUTIL CMAIp6 -n <Name or IP address of Domain Management Server> [-v <Version_ID>]
```

## Parameters

| Parameter                                                              | Description                                                                                                                     |
|------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <code>-n &lt;Name or IP address of Domain Management Server&gt;</code> | Specifies the Domain Management Server by its name or IPv6 address.                                                             |
| <code>-v &lt;Version_ID&gt;</code>                                     | Specifies the internal Version ID.<br>See the " <a href="#">\$MDSVERUTIL AllVersions</a> " on <a href="#">page 826</a> command. |

# \$MDSVERUTIL CMALogExporterDir

## Description

Returns the full path for the `$EXPORTERDIR` directory in the context of the specified Domain Management Server.

In addition, see the ["\\$MDSVERUTIL MDSLogExporterDir" on page 866](#) command.

## Syntax

```
$MDSVERUTIL CMALogExporterDir -n <Name or IP address of Domain Management Server> [-v <Version_ID>]
```

## Parameters

| Parameter                                                              | Description                                                                                                   |
|------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>-n &lt;Name or IP address of Domain Management Server&gt;</code> | Specifies the Domain Management Server by its name or IPv4 address.                                           |
| <code>-v &lt;Version_ID&gt;</code>                                     | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example

```
[Expert@MDS:0]# $MDSVERUTIL CMALogExporterDir -n MyDomain_Server  
/opt/CPmds-R82.10/customers/MyDomain_Server/CPrt-R82.10/log_exporter  
[Expert@MDS:0]#
```

# \$MDSVERUTIL CMALogIndexerDir

## Description

Returns the full path for the `$INDEXERDIR` directory in the context of the specified Domain Management Server.

In addition, see the ["\\$MDSVERUTIL MDSLogIndexerDir" on page 867](#) command.

## Syntax

```
$MDSVERUTIL CMALogIndexerDir -n <Name or IP address of Domain Management Server> [-v <Version_ID>]
```

## Parameters

| Parameter                                                              | Description                                                                                                |
|------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| <code>-n &lt;Name or IP address of Domain Management Server&gt;</code> | Specifies the Domain Management Server by its name or IPv4 address.                                        |
| <code>-v &lt;Version_ID&gt;</code>                                     | Specifies the internal Version ID. See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example

```
[Expert@MDS:0]# $MDSVERUTIL CMALogIndexerDir -n MyDomain_Server  
/opt/CPmds-R82.10/customers/MyDomain_Server/CPrt-R82.10/log_indexer  
[Expert@MDS:0]#
```

# \$MDSVERUTIL CMANameByFwDir

## Description

Returns the name of the Domain Management Server based on the context of the current `$FWDIR` directory.

## Syntax

```
$MDSVERUTIL CMANameByFwDir -d $FWDIR [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example

```
[Expert@MDS:0]# $MDSVERUTIL CMANameByFwDir -d $FWDIR
MyDomain_Server
[Expert@MDS:0]#
```

# \$MDSVERUTIL CMANameByIp

## Description

Returns the name of the Domain Management Server based on the specified IPv4 address.

## Syntax

```
$MDSVERUTIL CMANameByIp -i <IP address of Domain Management Server> [-v <Version_ID>]
```

## Parameters

| Parameter                                   | Description                                                                                                   |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| -i <IP address of Domain Management Server> | Specifies the Domain Management Server by its IPv4 address.                                                   |
| -v <Version_ID>                             | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example

```
[Expert@MDS:0]# $MDSVERUTIL CMANameByIp -i 192.168.3.240
MyDomain_Server
[Expert@MDS:0]#
```

# \$MDSVERUTIL CMARegistryDir

## Description

Returns the full path for the `$CPDIR/registry/` directory in the context of the specified Domain Management Server.

In addition, see the ["\\$MDSVERUTIL MDSRegistryDir" on page 869](#) command.

## Syntax

```
$MDSVERUTIL CMARegistryDir -n <Name of Domain Management Server>
[-v <Version_ID>]
```

## Parameters

| Parameter                                                | Description                                                                                                   |
|----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>-n &lt;Name of Domain Management Server&gt;</code> | Specifies the Domain Management Server by its name.                                                           |
| <code>-v &lt;Version_ID&gt;</code>                       | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example

```
[Expert@MDS:0]# $MDSVERUTIL CMARegistryDir -n MyDomain_Server
/opt/CPmds-R82.10/customers/MyDomain_Server/CPshrd-R82.10/registry
[Expert@MDS:0]#
```

# \$MDSVERUTIL CMAReporterDir

## Description

Returns the full path for the \$RTDIR directory in the context of the specified Domain Management Server.

In addition, see the ["\\$MDSVERUTIL MDSReporterDir" on page 870](#) command.

## Syntax

```
$MDSVERUTIL CMAReporterDir -n <Name of Domain Management Server>
[-v <Version_ID>]
```

## Parameters

| Parameter                             | Description                                                                                                   |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------|
| -n <Name of Domain Management Server> | Specifies the Domain Management Server by its name.                                                           |
| -v <Version_ID>                       | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example

```
[Expert@MDS:0]# $MDSVERUTIL CMAReporterDir -n MyDomain_Server
/opt/CPmds-R82.10/customers/MyDomain_Server/CPrt-R82.10
[Expert@MDS:0]#
```

# \$MDSVERUTIL CMASmartLogDir

## Description

Returns the full path for the \$SMARTLOGDIR directory in the context of the specified Domain Management Server.

In addition, see the ["\\$MDSVERUTIL MDSSmartLogDir" on page 871](#) command.

## Syntax

```
$MDSVERUTIL CMASmartLogDir -n <Name of Domain Management Server>
[-v <Version_ID>]
```

## Parameters

| Parameter                             | Description                                                                                                   |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------|
| -n <Name of Domain Management Server> | Specifies the Domain Management Server by its name.                                                           |
| -v <Version_ID>                       | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example

```
[Expert@MDS:0]# $MDSVERUTIL CMASmartLogDir -n MyDomain_Server
/opt/CPmds-R82.10/customers/MyDomain_Server/CPSmartLog-R82.10
[Expert@MDS:0]#
```

# \$MDSVERUTIL CMASvnConfDir

## Description

Returns the full path for the `$CPDIR/conf/` directory in the context of the specified Domain Management Server.

## Syntax

```
$MDSVERUTIL CMASvnConfDir -n <Name of Domain Management Server> [-v <Version_ID>]
```

## Parameters

| Parameter                                                | Description                                                                                                   |
|----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>-n &lt;Name of Domain Management Server&gt;</code> | Specifies the Domain Management Server by its name.                                                           |
| <code>-v &lt;Version_ID&gt;</code>                       | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example

```
[Expert@MDS:0]# $MDSVERUTIL CMASvnConfDir -n MyDomain_Server
/opt/CPmds-R82.10/customers/MyDomain_Server/CPshrd-R82.10/conf
[Expert@MDS:0]#
```

# \$MDSVERUTIL CMASvnDir

## Description

Returns the full path for the `$CPDIR` directory in the context of the specified Domain Management Server.

In addition, see these commands:

- ["\\$MDSVERUTIL MDSSvnDir" on page 872](#)
- ["\\$MDSVERUTIL MDSVarSvnDir" on page 877](#)

## Syntax

```
$MDSVERUTIL CMASvnDir -n <Name of Domain Management Server> [-v <Version_ID>]
```

## Parameters

| Parameter                                                | Description                                                                                                   |
|----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>-n &lt;Name of Domain Management Server&gt;</code> | Specifies the Domain Management Server by its name.                                                           |
| <code>-v &lt;Version_ID&gt;</code>                       | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example

```
[Expert@MDS:0]# $MDSVERUTIL CMASvnDir -n MyDomain_Server
/opt/CPmds-R82.10/customers/MyDomain_Server/CPshrd-R82.10
[Expert@MDS:0]#
```

# \$MDSVERUTIL ConfDirVersion

## Description

Returns the internal Version ID based on the context of the current `$FWDIR/conf/` directory.

For information about the internal Version ID, see the ["\\$MDSVERUTIL AllVersions" on page 826](#) command.

## Syntax

```
$MDSVERUTIL ConfDirVersion -d $FWDIR/conf
```

## Example

```
[Expert@MDS:0]# $MDSVERUTIL ConfDirVersion -d $FWDIR/conf  
VID_92  
[Expert@MDS:0]#
```

# \$MDSVERUTIL CpdbUpParam

## Description

Returns internal version numbers from the internal database.

In addition, see these commands:

- ["\\$MDSVERUTIL MSP" on page 878](#)
- ["\\$MDSVERUTIL SP" on page 885](#)

## Syntax

```
$MDSVERUTIL CpdbUpParam [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL CpdbUpParam  
6.0.5.1  
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL CpdbUpParam -v VID_90  
6.0.4.0  
[Expert@MDS:0]#
```

## Example 3

```
[Expert@MDS:0]# $MDSVERUTIL CpdbUpParam -v VID_65  
6.0.1.0  
[Expert@MDS:0]#
```

# \$MDSVERUTIL CPprofileDir

## Description

Returns the path to the directory that contains the `.CPprofile.sh` and the `.CPprofile.csh` shell scripts.

## Syntax

```
$MDSVERUTIL CPprofileDir [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL CPprofileDir  
/opt/CPshrd-R82.10/tmp  
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL CPprofileDir -v VID_90  
/opt/CPshrd-R77/tmp  
[Expert@MDS:0]#
```

# \$MDSVERUTIL CPVer

## Description

Returns internal Check Point version number.

## Syntax

```
$MDSVERUTIL CPVer [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                     |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the " <a href="#">\$MDSVERUTIL AllVersions</a> " on page 826 command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL CPVer
9.0
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL CPVer -v VID_80
8.0
[Expert@MDS:0]#
```

# \$MDSVERUTIL CustomersBaseDir

## Description

Returns the full path for the \$MDSDIR/customers/ directory.

## Syntax

```
$MDSVERUTIL CustomersBaseDir [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                     |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the " <a href="#">\$MDSVERUTIL AllVersions</a> " on page 826 command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL CustomersBaseDir
/opt/CPmds-R82.10/customers
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL CustomersBaseDir -v VID_90
/opt/CPmds-R77/customers
[Expert@MDS:0]#
```

# \$MDSVERUTIL DiskSpaceFactor

## Description

Returns the disk-space factor. The `mds_setup` command uses this value during an upgrade.

## Syntax

```
$MDSVERUTIL DiskSpaceFactor [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                     |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the " <a href="#">\$MDSVERUTIL AllVersions</a> " on page 826 command. |

## Example

```
[Expert@MDS:0]# $MDSVERUTIL DiskSpaceFactor
1
[Expert@MDS:0]#
```

# \$MDSVERUTIL InstallationLogDir

## Description

Returns the full path for directory with all installation logs (/opt/CPInstLog/).

## Syntax

```
$MDSVERUTIL InstallationLogDir [-v <Version_ID>]
```

## Parameters

| Parameter       | Description                                                                                                     |
|-----------------|-----------------------------------------------------------------------------------------------------------------|
| -v <Version_ID> | Specifies the internal Version ID.<br>See the " <a href="#">\$MDSVERUTIL AllVersions</a> " on page 826 command. |

## Example

```
[Expert@MDS:0]# $MDSVERUTIL InstallationLogDir
/opt/CPInstLog
[Expert@MDS:0]#
```

# \$MDSVERUTIL IsIPv6Enabled

## Description

Returns `true`, if IPv6 is enabled in Gaia OS.

Returns `false`, if IPv6 is disabled in Gaia OS.

To configure an IPv6 address on a Multi-Domain Security Management Server, see the [R82.10 Gaia Administration Guide](#).

## Syntax

```
$MDSVERUTIL IsIPv6Enabled
```

# \$MDSVERUTIL IsLegalVersion

## Description

Returns 0, if the specified internal Version ID is legal.

Returns 1, if the specified internal Version ID is illegal.

## Syntax

```
$MDSVERUTIL IsLegalVersion -v <Version_ID>
```

## Parameters

| Parameter                          | Description                                                                                                     |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the " <a href="#">\$MDSVERUTIL AllVersions</a> " on page 826 command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL IsLegalVersion -v VID_92
0
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL IsLegalVersion -v VID_123456
1
[Expert@MDS:0]#
```

# \$MDSVERUTIL IsOsSupportsIPv6

## Description

Returns `true`, if the OS supports IPv6.

Returns `false`, if the OS does not support IPv6.

To configure an IPv6 address on a Multi-Domain Security Management Server, see the [R82.10 Gaia Administration Guide](#).

## Syntax

```
$MDSVERUTIL IsOsSupportsIPv6
```

# \$MDSVERUTIL LatestVersion

## Description

Returns the internal Version ID of the latest installed version.

## Syntax

```
$MDSVERUTIL LatestVersion
```

See the "[\\$MDSVERUTIL AllVersions](#)" on page 826 command.

## Example

```
[Expert@MDS:0]# $MDSVERUTIL LatestVersion  
VID_92  
[Expert@MDS:0]#
```

# \$MDSVERUTIL MDSAddonDir

## Description

Returns the path to the Management Addon directory in the MDS context.

In addition, see the ["\\$MDSVERUTIL CMAAddonDir" on page 829](#) command.

## Syntax

```
$MDSVERUTIL MDSAddonDir [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example

```
[Expert@MDS:0]# $MDSVERUTIL MDSAddonDir
/opt/CPmgmt-R55W
[Expert@MDS:0]#
```

# \$MDSVERUTIL MDSCompDir

## Description

Returns the full path for the specified Backward Compatibility Package in the MDS context.

In addition, see these commands:

- ["\\$MDSVERUTIL CMACompDir" on page 830](#)
- ["\\$MDSVERUTIL MDSVarCompDir" on page 873](#)

## Syntax

```
$MDSVERUTIL MDSCompDir -c <Name of Backward Compatibility Package>
```

## Parameters

| Parameter                                                      | Description                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-c &lt;Name of Backward Compatibility Package&gt;</code> | <p>Specifies the name of Backward Compatibility Package. The Backward Compatibility Package contains the applicable files to install policy on Security Gateways that run a lower version than the Multi-Domain Server.</p> <p>To see the list of all Backward Compatibility Packages, run in Expert mode:</p> <pre>ls -l /opt/   grep CMP</pre> |

## Example

```
[Expert@MDS:0]# $MDSVERUTIL MDSCompDir -c CPR77CMP-R82.10
/opt/CPR77CMP-R82.10
[Expert@MDS:0]#
```

# \$MDSVERUTIL MDSDir

## Description

Returns the full path in the `/opt/` directory to the `$MDSDIR` directory.

In addition, see the ["\\$MDSVERUTIL MDSVarDir" on page 874](#) command.

## Syntax

```
$MDSVERUTIL MDSDir [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL MDSDir
/opt/CPmds-R82.10
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL MDSDir -v VID_90
/opt/CPmds-R77
[Expert@MDS:0]#
```

# \$MDSVERUTIL MDSFgDir

## Description

Returns the full path for the `$FGDIR` directory in the MDS context.

In addition, see the ["\\$MDSVERUTIL CMAFgDir" on page 831](#) command.

## Syntax

```
$MDSVERUTIL MDSFgDir [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL MDSFgDir
/opt/CPsuite-R82.10/fg1
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL MDSFgDir -v VID_90
/opt/CPsuite-R77/fg1
[Expert@MDS:0]#
```

# \$MDSVERUTIL MDSFwbcDir

 **Note** - R82.10 does not support UTM-1 Edge and Safe@Office devices. The information about this command is provided only to describe the existing syntax option until it is removed completely.

## Description

Returns the full path in the `/opt/` directory (in the MDS context) for the Backward Compatibility directory for UTM-1 Edge devices.

This Backward Compatibility directory contains the applicable files to install policy on UTM-1 Edge devices.

In addition, see the ["\\$MDSVERUTIL MDSVarFwbcDir" on page 875](#) command.

## Syntax

```
$MDSVERUTIL MDSFwbcDir [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL MDSFwbcDir
/opt/CPEdgecmp-R82.10
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL MDSFwbcDir -v VID_90
/opt/CPEdgecmp-R77
[Expert@MDS:0]#
```

# \$MDSVERUTIL MDSFwDir

## Description

Returns the full path in the `/opt/` directory for the `$FWDIR` directory in the MDS context.

In addition, see these commands:

- ["\\$MDSVERUTIL MDSVarFwDir" on page 876](#)
- ["\\$MDSVERUTIL CMAFwDir" on page 835](#)

## Syntax

```
$MDSVERUTIL MDSFwDir [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL MDSFwDir
/opt/CPsuite-R82.10/fw1
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL MDSFwDir -v VID_90
/opt/CPsuite-R77/fw1
[Expert@MDS:0]#
```

# \$MDSVERUTIL MDSIp

## Description

Returns the IPv4 address of Multi-Domain Server.

In addition, see the "[\\$MDSVERUTIL CMAIp](#)" on page 836 command.

## Syntax

```
$MDSVERUTIL MDSIp [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                     |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the " <a href="#">\$MDSVERUTIL AllVersions</a> " on page 826 command. |

## Example

```
[Expert@MDS:0]# $MDSVERUTIL MDSIp  
192.168.3.51  
[Expert@MDS:0]#
```

# \$MDSVERUTIL MDSIp6

## Description

Returns the IPv6 address of Multi-Domain Server.

In addition, see the ["\\$MDSVERUTIL CMAIp6" on page 837](#) command.

To configure an IPv6 address on a Multi-Domain Security Management Server, see the [R82.10 Gaia Administration Guide](#).

## Syntax

```
$MDSVERUTIL MDSIp6 [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

# \$MDSVERUTIL MDSLogExporterDir

## Description

Returns the full path for the `$EXPORTERDIR` directory in the MDS context.

In addition, see the ["\\$MDSVERUTIL CMALogExporterDir" on page 838](#) command.

## Syntax

```
$MDSVERUTIL MDSLogExporterDir [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL MDSLogExporterDir
/opt/CPrt-R82.10/log_exporter
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL MDSLogExporterDir -v VID_91
/opt/CPrt-R80/
[Expert@MDS:0]#
```

# \$MDSVERUTIL MDSLogIndexerDir

## Description

Returns the full path for the `$INDEXERDIR` directory in the MDS context.

In addition, see the ["\\$MDSVERUTIL CMALogIndexerDir" on page 839](#) command.

## Syntax

```
$MDSVERUTIL MDSLogIndexerDir [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL MDSLogIndexerDir
/opt/CPrt-R82.10/log_indexer
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL MDSLogIndexerDir -v VID_91
/opt/CPrt-R80/
[Expert@MDS:0]#
```

# \$MDSVERUTIL MDSPkgName

## Description

Returns the name of the MDS software package.

In addition, see the "[\\$MDSVERUTIL SVNPackageName on page 886](#)" command.

## Syntax

```
$MDSVERUTIL MDSPkgName [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                     |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the " <a href="#">\$MDSVERUTIL AllVersions on page 826</a> " command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL MDSPkgName
CPmds-R82.10-00
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL MDSPkgName -v VID_90
CPmds-R77-00
[Expert@MDS:0]#
```

# \$MDSVERUTIL MDSRegistryDir

## Description

Returns the full path for the `$CPDIR/registry/` directory in the MDS context.

In addition, see the ["\\$MDSVERUTIL CMARegistryDir" on page 842](#) command.

## Syntax

```
$MDSVERUTIL MDSRegistryDir [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL MDSRegistryDir
/opt/CPshrd-R82.10/registry
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL MDSRegistryDir -v VID_90
/opt/CPshrd-R77/registry
[Expert@MDS:0]#
```

# \$MDSVERUTIL MDSReporterDir

## Description

Returns the full path for the \$RTDIR directory in the MDS context.

In addition, see the ["\\$MDSVERUTIL CMAReporterDir" on page 843](#) command.

## Syntax

```
$MDSVERUTIL MDSReporterDir [-v <Version_ID>]
```

## Parameters

| Parameter       | Description                                                                                                   |
|-----------------|---------------------------------------------------------------------------------------------------------------|
| -v <Version_ID> | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL MDSReporterDir
/opt/CPrt-R82.10
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL MDSReporterDir -v VID_91
/opt/CPrt-R80
[Expert@MDS:0]#
```

# \$MDSVERUTIL MDSSmartLogDir

## Description

Returns the full path for the \$SMARTLOGDIR directory in the MDS context.

In addition, see the ["\\$MDSVERUTIL CMASmartLogDir" on page 844](#) command.

## Syntax

```
$MDSVERUTIL MDSSmartLogDir [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL MDSSmartLogDir
/opt/CPSmartLog-R82.10
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL MDSSmartLogDir -v VID_91
/opt/CPSmartLog-R80
[Expert@MDS:0]#
```

# \$MDSVERUTIL MDSSvnDir

## Description

Returns the full path in the `/opt/` directory for the `$CPDIR` directory in the MDS context.

In addition, see these commands:

- ["\\$MDSVERUTIL CMASvnDir" on page 846](#)
- ["\\$MDSVERUTIL MDSVarSvnDir" on page 877](#)

## Syntax

```
$MDSVERUTIL MDSSvnDir [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL MDSSvnDir
/opt/CPshrd-R82.10
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL MDSSvnDir -v VID_91
/opt/CPshrd-R80
[Expert@MDS:0]#
```

# \$MDSVERUTIL MDSVarCompDir

## Description

Returns the full path in the `/var/opt/` directory for the specified Backward Compatibility Package in the MDS context.

In addition, see these commands:

- ["\\$MDSVERUTIL CMACompDir" on page 830](#)
- ["\\$MDSVERUTIL MDSCompDir" on page 859](#)

## Syntax

```
$MDSVERUTIL MDSVarCompDir -c <Name of Backward Compatibility Package>
```

## Parameters

| Parameter                                                      | Description                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-c &lt;Name of Backward Compatibility Package&gt;</code> | <p>Specifies the name of Backward Compatibility Package. The Backward Compatibility Package contains the applicable files to install policy on Security Gateways that run a lower version than the Multi-Domain Server.</p> <p>To see the list of all Backward Compatibility Packages, run in Expert mode:</p> <pre>ls -l /var/opt/   grep CMP</pre> |

## Example

```
[Expert@MDS:0]# $MDSVERUTIL MDSVarCompDir -c CPR77CMP-R82.10
/var/opt/CPR77CMP-R82.10
[Expert@MDS:0]#
```

# \$MDSVERUTIL MDSVarDir

## Description

Returns the full path in the `/var/opt/` directory to the `$MDSDIR` directory.

In addition, see the ["\\$MDSVERUTIL MDSDir" on page 860](#) command.

## Syntax

```
$MDSVERUTIL MDSVarDir [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL MDSVarDir  
/var/opt/CPmds-R82.10  
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL MDSVarDir -v VID_90  
/var/opt/CPmds-R77  
[Expert@MDS:0]#
```

# \$MDSVERUTIL MDSVarFwbcDir

 **Note** - R82.10 does not support UTM-1 Edge and Safe@Office devices. The information about this command is provided only to describe the existing syntax option until it is removed completely.

## Description

Returns the full path in the `/var/opt/` directory (in the MDS context) for the Backward Compatibility directory for UTM-1 Edge devices.

This Backward Compatibility directory contains the applicable files to install policy on UTM-1 Edge devices.

In addition, see the ["\\$MDSVERUTIL MDSFwbcDir" on page 862](#) command.

## Syntax

```
$MDSVERUTIL MDSVarFwbcDir [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL MDSVarFwbcDir
/var/opt/CPEdgecmp-R82.10
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL MDSVarFwbcDir -v VID_90
/var/opt/CPEdgecmp-R77
[Expert@MDS:0]#
```

# \$MDSVERUTIL MDSVarFwDir

## Description

Returns the full path in the `/var/opt/` directory for the `$FWDIR` directory in the MDS context.

In addition, see the ["\\$MDSVERUTIL MDSFwDir" on page 863](#) command.

## Syntax

```
$MDSVERUTIL MDSVarFwDir [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL MDSVarFwDir
/var/opt/CPsuite-R82.10/fw1
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL MDSVarFwDir -v VID_90
/var/opt/CPsuite-R77/fw1
[Expert@MDS:0]#
```

# \$MDSVERUTIL MDSVarSvnDir

## Description

Returns the full path in the `/var/opt/` directory for the `$CPDIR` directory in the MDS context.

In addition, see these commands:

- ["\\$MDSVERUTIL CMASvnDir" on page 846](#)
- ["\\$MDSVERUTIL MDSSvnDir" on page 872](#)

## Syntax

```
$MDSVERUTIL MDSVarSvnDir [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL MDSVarSvnDir
/var/opt/CPshrd-R82.10
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL MDSVarSvnDir -v VID_90
/var/opt/CPshrd-R77
[Expert@MDS:0]#
```

# \$MDSVERUTIL MSP

## Description

Returns the Minor Service Pack version.

In addition, see these commands:

- ["\\$MDSVERUTIL SP" on page 885](#)
- ["\\$MDSVERUTIL CpdbUpParam" on page 848](#)

## Syntax

```
$MDSVERUTIL MSP [-v <Version_ID>]
```

## Parameters

| Parameter       | Description                                                                                                   |
|-----------------|---------------------------------------------------------------------------------------------------------------|
| -v <Version_ID> | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL MSP
9
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL MSP -v VID_91
8
[Expert@MDS:0]#
```

# \$MDSVERUTIL OfficialName

## Description

Returns the official version name.

In addition, see the ["\\$MDSVERUTIL ShortOfficialName" on page 883](#) command.

## Syntax

```
$MDSVERUTIL OfficialName [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL OfficialName
R80.20
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL OfficialName -v VID_91
R80
[Expert@MDS:0]#
```

## Example 3

```
[Expert@MDS:0]# $MDSVERUTIL OfficialName -v VID_65
NGX R65
[Expert@MDS:0]#
```

# \$MDSVERUTIL OptionPack

## Description

Returns the internal Option Pack version.

## Syntax

```
$MDSVERUTIL OptionPack [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                     |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the " <a href="#">\$MDSVERUTIL AllVersions</a> " on page 826 command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL OptionPack
3
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL OptionPack -v VID_90
1
[Expert@MDS:0]#
```

# \$MDSVERUTIL ProductName

## Description

Returns the official name of the Multi-Domain Server product.

## Syntax

```
$MDSVERUTIL ProductName [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                     |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the " <a href="#">\$MDSVERUTIL AllVersions</a> " on page 826 command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL ProductName
Multi-Domain Security Management
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL ProductName -v VID_65
Provider-1
[Expert@MDS:0]#
```

# \$MDSVERUTIL RegistryCurrentVer

## Description

Returns the current internal version of Check Point Registry.

## Syntax

```
$MDSVERUTIL RegistryCurrentVer [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                     |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the " <a href="#">\$MDSVERUTIL AllVersions</a> " on page 826 command. |

## Example

```
[Expert@MDS:0]# $MDSVERUTIL RegistryCurrentVer
6.0
[Expert@MDS:0]#
```

# \$MDSVERUTIL ShortOfficialName

## Description

Returns the short (without spaces) official version name.

In addition, see the ["\\$MDSVERUTIL OfficialName" on page 879](#) command.

## Syntax

```
$MDSVERUTIL ShortOfficialName [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL ShortOfficialName
R80.20
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# ShortOfficialName -v VID_65
NGX_65
[Expert@MDS:0]#
```

# \$MDSVERUTIL SmartCenterPuvUpgradeParam

## Description

Returns the version to the Pre-Upgrade Verifier (PUV) in order for it to upgrade to that version.

## Syntax

```
$MDSVERUTIL SmartCenterPuvUpgradeParam [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                     |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the " <a href="#">\$MDSVERUTIL AllVersions</a> " on page 826 command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL SmartCenterPuvUpgradeParam  
R80.20  
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL SmartCenterPuvUpgradeParam -v VID_90  
R77  
[Expert@MDS:0]#
```

## Example 3

```
[Expert@MDS:0]# $MDSVERUTIL SmartCenterPuvUpgradeParam -v VID_65  
NGX_R65  
[Expert@MDS:0]#
```

# \$MDSVERUTIL SP

## Description

Returns the Service Pack version.

In addition, see these commands:

- ["\\$MDSVERUTIL MSP" on page 878](#)
- ["\\$MDSVERUTIL CpdbUpParam" on page 848](#)

## Syntax

```
$MDSVERUTIL SP [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL SP
4
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL SP -v VID_91
4
[Expert@MDS:0]#
```

# \$MDSVERUTIL SVNpkgName

## Description

Returns the name of the Secure Virtual Network (SVN) package. Applies to versions NGX R60 and above.

In addition, see the ["\\$MDSVERUTIL MDSPkgName" on page 868](#) command.

## Syntax

```
$MDSVERUTIL SVNpkgName [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the <a href="#">"\$MDSVERUTIL AllVersions" on page 826</a> command. |

## Example 1

```
[Expert@MDS:0]# $MDSVERUTIL SVNpkgName  
CPsuite-R82.10-00  
[Expert@MDS:0]#
```

## Example 2

```
[Expert@MDS:0]# $MDSVERUTIL SVNpkgName -v VID_90  
CPsuite-R77-00  
[Expert@MDS:0]#
```

# \$MDSVERUTIL SvrDirectory

## Description

Returns the full path for the SmartReporter directory.

## Syntax

```
$MDSVERUTIL SvrDirectory [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                     |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the " <a href="#">\$MDSVERUTIL AllVersions</a> " on page 826 command. |

# \$MDSVERUTIL SvrParam

## Description

Returns the SmartReporter version.

## Syntax

```
$MDSVERUTIL SvrParam [-v <Version_ID>]
```

## Parameters

| Parameter                          | Description                                                                                                     |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <code>-v &lt;Version_ID&gt;</code> | Specifies the internal Version ID.<br>See the " <a href="#">\$MDSVERUTIL AllVersions</a> " on page 826 command. |

# Creating a Domain Management Server with the 'mgmt\_cli' Command

## Prerequisites

- Name or Identifier of the Domain. For example: `MyDomain`
- Name or Identifier of the new Domain Management Server. For example: `MyDMS`
- IPv4 address for the new Domain Management Server.
- IPv4 Address for the Multi-Domain Server.
- The Multi-Domain Server username and password for a Multi-Domain Superuser, who has permission to create the new Domain Management Server.

## To create a new Domain Management Server

1. Connect to the command line on the Multi-Domain Server.
2. Log in to the Expert mode with the Superuser credentials.
3. Create the Domain Management Server.

Run this command:

```
mgmt_cli add domain name <domain_name> servers.ip address  
"<ipv4>" servers.name "<server_name>" servers.multi-domain-  
server "<mdm_name>"
```

For more information, see ["mgmt\\_cli" on page 782](#).

Example:

```
mgmt_cli add domain name "domain1" servers.ip-address  
"192.0.2.1" servers.name "domain1_ManagementServer_1"  
servers.multi-domain-server "primary_mdm"
```

4. Connect with SmartConsole to the new Domain Management Server to configure the applicable settings.

# SmartProvisioning Commands

For more information about SmartProvisioning, see the [R82.10 SmartProvisioning Administration Guide](#).

In addition, see "[Security Management Server Commands](#)" on page 42.

# Managing Security through API

This section describes the API Server on a Management Server and the applicable API Tools.

## API

You can configure and manage the Management Server through API Requests that you send to the API Server that runs on the Management Server.

The API Server can automate daily tasks and integrate Check Point solutions with 3rd-party systems, such as virtualization, ticketing, and change management systems.

To learn more about the management APIs, to see code samples, and to take advantage of user forums, see:

- The API Documentation:

- Online - [Check Point Management API Reference](#) (at the top, select the correct version)
- Local - `https://<IP Address of Management Server>/api_docs`

By default, access to the local API Documentation is disabled. Follow the instructions in [sk174606](#).

**Note** - On a Standalone server (a server which runs both a Security Management Server and a Security Gateway), the API Documentation web portal (`https://<IP Address of Management Server>/api_docs`) stops working when you open SmartView Web Application (`https://<IP Address of Management Server>/smartview`).

- The **Developers Network** section of [Check Point CheckMates Community](#).

## API Tools

You can run the required API commands on the Management Server in these ways:

- From the Command Line dialog in the SmartConsole GUI application (bottom left corner).
- From the command line on the Management Server with the "mgmt\_cli" command in the Expert mode.
- From the command line on the Management Server with the "mgmt" command in Gaia Clish.
- From the command line on the SmartConsole client host with the "mgmt\_cli.exe" tool (installed as part of SmartConsole for Windows OS).

# Configuring the API Server

To configure the API Server:

1. Connect with SmartConsole to the Security Management Server or applicable Domain Management Server.
2. From the left navigation panel, click **Manage & Settings**.
3. In the upper left section, click **Blades**.
4. In the **Management API** section, click **Advanced Settings**.

The **Management API Settings** window opens.

5. Configure the **Startup Settings** and the **Access Settings**.

## Configuring Startup Settings

Select **Automatic start** to automatically start the API server when you start or reboot the Management Server.

### Notes:

- If the Management Server has more than 4GB of RAM installed, the **Automatic start** option is activated by default during the Management Server installation.
- If the Management Server has less than 4GB of RAM, the **Automatic start** option is deactivated.

## Configuring Access Settings

Select one of these options to configure which clients can connect to the API Server:

- **Management server only**

Only the Management Server itself can connect to the API Server.

This option only lets you use the `mgmt_cli` utility on the Management Server command line to send API requests.

You cannot use SmartConsole or Web services to send API requests.

- **All IP addresses that can be used for GUI clients**

You can send API requests from all IP addresses that are defined in SmartConsole > **Permissions & Administrators** > **Trusted Clients**.

This includes requests from SmartConsole, Web services, and the `mgmt_cli` utility on the Management Server.

- **All IP addresses**

You can send API requests from all IP addresses.

This includes requests from SmartConsole, Web services, and the `mgmt_cli` utility on the Management Server.

6. Click **OK**.
7. In the upper left section, click **Permissions & Administrators**.
8. In the object of each applicable Administrator, make sure the assigned Permission Profile allows access to Management API.

### Instructions

- a. Edit the Administrator object.
- b. In the left panel, click **General**.
- c. In the **Permissions** section, on the right side of the selected Permission Profile, click the eye icon.  
  
The Permission Profile object opens in the read-only view.
- d. In the left panel, click **Management**.
- e. The permission **Management API Login** has to be selected.  
  
If it is not selected, then close this window and edit this Permission Profile object.
- f. Click **Close**.

9. Publish the SmartConsole session.
10. Restart the API Server on the Management Server with this command:

```
api restart
```

 **Notes:**

- On a Multi-Domain Server, you must run this command in the context of the applicable Domain Management Server:

```
mdsenv <IP Address or Name of Domain Management Server>
```

- The output of this command must show:

```
API started successfully
```

11. Examine the status of the API server on the Management Server with this command:

```
api status
```

**Notes:**

- The output of this command must show:

```
-----
Overall API Status: Started
-----

API readiness test SUCCESSFUL. The server is up and ready
to receive connections
```

- The output of this command may show the state of the "API" process as "Stopped" when the API access is set to "All IP addresses that can be used for GUI clients", and more than 200 Trusted Clients are configured:

```
Processes:

Name          State      PID      More Information
-----
API           Stopped   ...
```

## Discarding API Sessions with Locks or Pending Changes

Open SmartConsole and API sessions that contain locks or unpublished changes are not automatically discarded. As a result, some sessions can remain open for extended periods.

The `ENABLE_DISCARD_WORKSESSIONS_OLDER_THAN_DAYS` environment variable controls whether stale open sessions are automatically discarded. By default, this variable is disabled, and open sessions with locks or unpublished changes remain available until they are manually discarded.

When enabled, the Security Management Server periodically evaluates open sessions and discards sessions that exceed the configured age threshold.

### To configure automatic discard of stale sessions:

1. Connect to the Security Management Server or Multi-Domain Server using SSH.
2. Switch to Expert mode.
3. To enable automatic discard of open sessions that contain locks or unpublished changes, set `ENABLE_DISCARD_WORKSESSIONS_OLDER_THAN_DAYS` to `"true"`.

Run:

```
MDS_FWDIR/scripts/reload_env_vars.sh -e "ENABLE_DISCARD_
WORKSESSIONS_OLDER_THAN_DAYS=true"

$MDS_FWDIR/scripts/override_server_setting.sh -e ENABLE_DISCARD_
WORKSESSIONS_OLDER_THAN_DAYS true
```

4. By default, only sessions which are open for more than 60 days are automatically discarded. To configure the number of days after which sessions are discarded, run:

```
$MDS_FWDIR/scripts/reload_env_vars.sh -e "DISCARD_WORKSESSIONS_
OLDER_THAN_DAYS=<Number_of_Days>" $MDS_FWDIR/scripts/override_
server_setting.sh -e DISCARD_WORKSESSIONS_OLDER_THAN_DAYS
<Number_of_Days>
```

For example, to set the threshold to 30 days, run:

```
$MDS_FWDIR/scripts/reload_env_vars.sh -e "DISCARD_WORKSESSIONS_
OLDER_THAN_DAYS=30"
$MDS_FWDIR/scripts/override_server_setting.sh -e DISCARD_
WORKSESSIONS_OLDER_THAN_DAYS 30
```

### Result:

When `ENABLE_DISCARD_WORKSESSIONS_OLDER_THAN_DAYS` is set to `"true"`:

- The Security Management Server checks all open SmartConsole and API sessions one time per day.
- If a session remains open longer than the number of days configured in `DISCARD_WORKSESSIONS_OLDER_THAN_DAYS`, the session is automatically discarded.

# Check Point LSMcli Overview

## Description

Check Point SmartLSM Command Line Utility (LSMcli) is a simple command line utility, an alternative to SmartProvisioning SmartConsole GUI.

LSMcli performs SmartProvisioning GUI operations from a command line or through a script.

### Notes:

- LSMcli can run from hosts other than SmartConsole clients. Make sure to define the hosts, from which you run the LSMcli as GUI clients.
- The first time you run the LSMcli from a client, it shows the Management Server's fingerprint. Confirm the fingerprint.
- In the LSMcli, commands can use the abbreviation *ROBO* (Remote Office/Branch Office) gateways. In SmartProvisioning GUI, these gateways are called SmartLSM Security Gateways.

## Syntax

```
LSMcli {-h | --help}
```

```
LSMcli [-d] <Mgmt Server> <Username> <Password> <Action>
```

## Parameters

| Parameter                        | Description                                                                                       |
|----------------------------------|---------------------------------------------------------------------------------------------------|
| <code>[-d]</code>                | Runs the command in the debug mode.                                                               |
| <code>&lt;Mgmt Server&gt;</code> | Specifies the Security Management Server or Domain Management Server by its Name or IPv4 address. |
| <code>&lt;Username&gt;</code>    | Specifies the username used in the standard Check Point authentication method.                    |
| <code>&lt;Password&gt;</code>    | Specifies the password used in the standard Check Point authentication method.                    |
| <code>&lt;Action&gt;</code>      | Specifies the function performed (see the next sub-sections for a complete list of actions).      |

## Syntax Notation

Square brackets ([ ]) are used in the LSMcli utility syntax. These brackets are correct and syntactically necessary.

This is an example of how they are used:

- **A [b [c]]** - means that for parameter **A**, you can provide **b**. If you provide **b**, you can provide **c**.
- **A [b] [c]** - means that for parameter **A**, you can provide **b**, **c**, or **b** and **c**.
- **A [b c]** - means that for parameter **A**, you can provide **b** and **c**.

# SmartLSM Security Gateway Management Actions

This section describes commands that perform management actions on SmartLSM Gateways.

# LSMcli AddROBO VPN1

## Description

This command adds a new Check Point SmartLSM Security Gateway to SmartProvisioning and assigns it a SmartLSM Security Profile.

If a one-time password is supplied, a SIC certificate is created.

If an IP address is also supplied, the SIC certificate is pushed to the SmartLSM Security Gateway (in such cases, the SmartLSM Security Gateway SIC one-time password must be initialized first).

If no IP address is supplied, the SIC certificate is pulled from the SmartLSM Security Gateway afterwards.

You can also assign an IP address range to Dynamic Objects, and specify whether or not to add them to the VPN domain.

## Syntax

```
LSMcli [-d] <Mgmt Server> <Username> <Password> AddROBO VPN1
<ROBOName> <Profile> [-RoboCluster=<OtherROBOName>] [-
O=<ActivationKey> [-I=<IP>]] [[-CA=<CaName> [-
R=<CertificateIdentifier#>] [-KEY=<AuthorizationKey>]]] [-
D]:<DynamicObjectName>=<IP1>[-<IP2>] [-D]:...
```

## Parameters

| Parameter     | Description                                                                       |
|---------------|-----------------------------------------------------------------------------------|
| <Mgmt Server> | Name or IP address of the Security Management Server or Domain Management Server. |
| <Username>    | User name of standard Check Point authentication method.                          |
| <Password>    | Password of standard Check Point authentication method.                           |
| <RoboName>    | Name of a SmartLSM Security Gateway.                                              |
| <Profile>     | Name of a SmartLSM Security Profile that was defined in SmartConsole.             |

| Parameter                                   | Description                                                                                                                                                                           |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;OtherROBOName&gt;</code>          | Name for an already defined SmartLSM Security Gateway that participates in the SmartLSM Cluster with the newly created Security Gateway (if the "-RoboCluster" argument is provided). |
| <code>&lt;ActivationKey&gt;</code>          | SIC one-time password (for this action, a certificate is generated).                                                                                                                  |
| <code>&lt;IP&gt;</code>                     | IP address of the Security Gateway (for this action, a certificate is pushed to the Security Gateway).                                                                                |
| <code>&lt;CaName&gt;</code>                 | Name of the Trusted CA object (created from SmartConsole).<br>The IKE certificate request is sent to this CA. Default is Check Point Internal CA.                                     |
| <code>&lt;CertificateIdentifier#&gt;</code> | Key identifier for third-party CA.                                                                                                                                                    |
| <code>&lt;AuthorizationKey&gt;</code>       | Authorization Key for third-party CA.                                                                                                                                                 |
| <code>&lt;DynamicObjectName&gt;</code>      | Name of the Dynamic Object.                                                                                                                                                           |
| <code>&lt;IP1&gt;</code>                    | Single IP address for the Dynamic Object.                                                                                                                                             |
| <code>&lt;IP1-IP2&gt;</code>                | Range of IP addresses for the Dynamic Object.                                                                                                                                         |

### Example 1

This command adds a new SmartLSM Security Gateway `MyRobo` and assigns it the specified SmartLSM Security Profile `AnyProfile`.

A SIC password and an IP address are supplied, so the SIC Activation Key can be sent to the new SmartLSM Security Gateway.

A Dynamic Object called `FirstDO` is resolved to an IP address for this Security Gateway.

```
LSMcli mySrvr name pass AddROBO VPN1 MyRobo AnyProfile -O=MyPass -
I=192.0.2.4 -DE:FirstDO=192.0.2.100
```

### Example 2

```
LSMcli mySrvr name pass AddROBO VPN1 MyRobo AnyProfile -O=MyPass -
I=10.10.10.1 -DE:FirstDO=10.10.10.5 -CA=OPSEC_CA -R=cert123 -
KEY=abc456
```

# LSMcli ModifyROBO VPN1

## Description

This command modifies a Check Point SmartLSM Security Gateway.

This action modifies the SmartProvisioning details for an existing SmartLSM Security Gateway and can be used to update properties previously supplied by the user.

## Syntax

```
LSMcli [-d] <Mgmt Server> <Username> <Password> ModifyROBO VPN1
<RoboName> ...
```

and at least one of these:

```
... [-P=Profile] [-RoboCluster={<OtherROBOName> | -NoRoboCluster}]
[-D:<DO Name>=<IP1>[-<IP2>] [-KeepDOs] ...]
```

## Parameters

| Parameter            | Description                                                                                                                                                                                                                                                 |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <Mgmt Server>        | Name or IP address of the Security Management Server or Domain Management Server.                                                                                                                                                                           |
| <Username>           | User name of standard Check Point authentication method.                                                                                                                                                                                                    |
| <Password>           | Password of standard Check Point authentication method.                                                                                                                                                                                                     |
| <RoboName>           | Name of the SmartLSM Security Gateway.                                                                                                                                                                                                                      |
| <Profile>            | Name of a SmartLSM Security Profile that was defined in SmartConsole.                                                                                                                                                                                       |
| <OtherROBOName><br>> | Name of the already defined SmartLSM Security Gateway that is to participate in the Cluster with the newly created Security Gateway (if the "-RoboCluster" argument is provided).                                                                           |
| -NoRoboCluster       | This parameter is equivalent to the <b>Remove Cluster</b> operation in the SmartProvisioning GUI.<br>When you issue a <code>ModifyROBO VPN1</code> command with this argument on a Security Gateway that participates in a cluster, the cluster is removed. |
| <DO Name>            | Name of the Dynamic Object.                                                                                                                                                                                                                                 |

| Parameter | Description                                                                                                                                                                                                                                                                                                                                     |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <IP1>     | Single IP address for the Dynamic Object.                                                                                                                                                                                                                                                                                                       |
| <IP1-IP2> | Range of IP addresses for the Dynamic Object.                                                                                                                                                                                                                                                                                                   |
| -KeepDOs  | <p>Keeps all existing dynamic objects in the dynamic objects list when you add new dynamic objects.</p> <p>If a dynamic object already exists in the list, its IP resolution is updated.</p> <p>If this flag is not specified, the dynamic objects list is deleted when you use the <code>LSMcli</code> command to add new dynamic objects.</p> |

## Example

This example resolves Dynamic Objects for the given Security Gateway.

```
LSMcli mySrvr name pass ModifyROBO VPN1 MyRobo -  
D:MyEmailServer=123.45.67.8 -D:MySpecialNet=10.10.10.1-10.10.10.6
```

# LSMcli ModifyROBOManualVPNDomain

## Description

This command modifies the SmartLSM VPN Domain, to take effect when the VPN Domain becomes defined as Manual.

## Syntax

```
LSMcli [-d] <Mgmt Server> <Username> <Password>
ModifyROBOManualVPNDomain <RoboName> {-Add=<FirstIP>-<LastIP> | -
Delete=<Index>} [-IfOverlappingIPRangesDetected={exit | ignore |
warn}]
```

## Parameters

| Parameter                      | Description                                                                                                                                        |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <Mgmt Server>                  | Name or IP address of the Security Management Server or Domain Management Server.                                                                  |
| <Username>                     | User name of standard Check Point authentication method.                                                                                           |
| <Password>                     | Password of standard Check Point authentication method.                                                                                            |
| <RoboName>                     | Name of the SmartLSM Security Gateway or SmartLSM Cluster.                                                                                         |
| <FirstIP>-<LastIP>             | IP address range.                                                                                                                                  |
| <Index>                        | Value displayed by the <a href="#">"LSMcli ShowInfo" on page 927</a> command or the <a href="#">"LSMcli ShowROBOTopology" on page 916</a> command. |
| -IfOverlappingIPRangesDetected | Optional.<br>Determines the course of action, if overlapping IP address ranges are detected: exit, ignore, or show a warning.                      |

**Example 1**

```
LSMcli mySrvr name pass ModifyROBOManualVPNDomain MyRobo -  
Add=192.0.2.1-192.0.2.20
```

**Example 2**

```
LSMcli mySrvr name pass ModifyROBOManualVPNDomain MyRobo -Delete=1
```

# LSMcli ModifyROBOTopology VPN1

## Description

This command modifies the SmartLSM VPN Domain configuration for a selected Security Gateway.

## Syntax

```
LSMcli [-d] <Mgmt Server> <Username> <Password> ModifyROBOTopology
VPN1 <RoboName> -VPNDomain={not_defined | external_ip_only |
topology | manual}
```

## Parameters

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <Mgmt Server> | Name or IP address of the Security Management Server or Domain Management Server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <Username>    | User name of standard Check Point authentication method.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <Password>    | Password of standard Check Point authentication method.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <RoboName>    | Name of the SmartLSM Security Gateway.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| VPNDomain     | Specifies the VPN Domain topology: <ul style="list-style-type: none"> <li>▪ <code>not_defined</code> - Equivalent to the <b>Not Defined</b> option on the <b>Topology</b> tab of a SmartLSM Security Gateway in the SmartProvisioning GUI (or in the output of the "<a href="#">LSMcli ShowROBOTopology</a>" on page 916 command).</li> <li>▪ <code>external_ip_only</code> - Equivalent to the <b>Only the external interface</b> configuration in the SmartProvisioning GUI.</li> <li>▪ <code>topology</code> - Equivalent to the <b>All IP Addresses behind the Gateway based on Topology</b> information configuration in the SmartProvisioning GUI.</li> <li>▪ <code>manual</code> - Equivalent to <b>Manually defined</b>. VPN domain is defined according to the configuration made with the "<a href="#">LSMcli ModifyROBOManualVPNDomain</a>" on page 903 command.</li> </ul> |

## Example

```
LSMcli mySrvr name pass ModifyROBOTopology VPN1 MyRobo -
VPNDomain>manual
```

# LSMcli ModifyROBOInterface VPN1

## Description

This command modifies the Internal Interface list.

## Syntax

```
LSMcli [-d] <Mgmt Server> <Username> <Password>
ModifyROBOInterface VPN1 <RoboName> <InterfaceName> -i=<IPAddress>
[-Netmask=<NetMask>] [-IfOverlappingIPRangesDetected={exit |
ignore | warn}]
```

## Parameters

| Parameter                      | Description                                                                                                                   |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <Mgmt Server>                  | Name or IP address of the Security Management Server Domain Management Server.                                                |
| <Username>                     | User name of standard Check Point authentication method.                                                                      |
| <Password>                     | Password of standard Check Point authentication method.                                                                       |
| <RoboName>                     | Name of the SmartLSM Security Gateway.                                                                                        |
| <InterfaceName>                | Name of the existing interface.                                                                                               |
| <IPAddress>                    | IP address of the interface.                                                                                                  |
| <NetMask>                      | Net mask of the interface.                                                                                                    |
| -IfOverlappingIPRangesDetected | Optional.<br>Determines the course of action, if overlapping IP address ranges are detected: exit, ignore, or show a warning. |

## Example

```
LSMcli mySrvr name pass ModifyROBOInterface VPN1 MyRobo eth0 -
i=192.0.2.1 -Netmask=255.255.255.0
```

# LSMcli AddROBOInterface VPN1

## Description

This command adds a new interface to the selected SmartLSM Security Gateway.

## Syntax

```
LSMcli [-d] <Mgmt Server> <Username> <Password> AddROBOInterface  
VPN1 <RoboName> <InterfaceName> -i=<IPAddress> -NetMask=<NetMask>
```

## Parameters

| Parameter            | Description                                                                       |
|----------------------|-----------------------------------------------------------------------------------|
| <Mgmt Server>        | Name or IP address of the Security Management Server or Domain Management Server. |
| <Username>           | User name of standard Check Point authentication method.                          |
| <Password>           | Password of standard Check Point authentication method.                           |
| <RoboName>           | Name of the SmartLSM Security Gateway.                                            |
| <InterfaceName><br>> | Name of an existing interface.                                                    |
| <IPAddress>          | IP address of the interface.                                                      |
| <NetMask>            | Net mask of the interface.                                                        |

## Example

```
LSMcli mySrvr name pass AddROBOInterface VPN1 MyRobo eth0 -  
i=192.0.2.1 -Netmask=255.255.255.0
```

# LSMcli DeleteROBOInterface VPN1

## Description

This command deletes an interface from the selected Security Gateway.

## Syntax

```
LSMcli [-d] <Mgmt Server> <Username> <Password>  
DeleteROBOInterface VPN1 <RoboName> <InterfaceName>
```

## Parameters

| Parameter            | Description                                                                       |
|----------------------|-----------------------------------------------------------------------------------|
| <Mgmt Server>        | Name or IP address of the Security Management Server or Domain Management Server. |
| <Username>           | User name of standard Check Point authentication method.                          |
| <Password>           | Password of standard Check Point authentication method.                           |
| <RoboName>           | Name of the SmartLSM Security Gateway.                                            |
| <InterfaceName><br>> | Name of an existing interface.                                                    |

## Example

```
LSMcli mySrvr name pass DeleteROBOInterface VPN1 MyRobo eth0
```

# LSMcli ExportIke

## Description

This command exports the IKE Certificate into a P12 file(encrypted with a provided password) from SmartLSM Security Gateway, SmartLSM Cluster, or SmartLSM Cluster Member.

The default location of the exported file is the `$FWDIR/conf/` directory.

## Syntax

```
LSMcli [-d] <Mgmt Server> <Username> <Password> ExportIke  
<RoboName> <Password> <FileName>
```

## Parameters

| Parameter                        | Description                                                                                                         |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <code>&lt;Mgmt Server&gt;</code> | Name or IP address of the Security Management Server or Domain Management Server.                                   |
| <code>&lt;Username&gt;</code>    | User name of standard Check Point authentication method.                                                            |
| <code>&lt;Password&gt;</code>    | Password of standard Check Point authentication method.                                                             |
| <code>&lt;RoboName&gt;</code>    | Name of the SmartLSM Security Gateway, SmartLSM Cluster, or SmartLSM Cluster Member, whose certificate is exported. |
| <code>&lt;Password&gt;</code>    | Password used to protect the p12 file.                                                                              |
| <code>&lt;FileName&gt;</code>    | Destination file name (is created).                                                                                 |

## Example

```
LSMcli mySrvr name pass ExportIke MyROBO ajg42k93N MyROBOCert.p12
```

# LSMcli ResetIke

## Description

This command resets the IKE Certificate of a SmartLSM Security Gateway, SmartLSM Cluster, or SmartLSM Cluster Member.

This action revokes the existing IKE certificate and creates a new one.

## Syntax

```
LSMcli [-d] <Mgmt Server> <Username> <Password> ResetIke
<RoboName> [-CA=<CaName> [-R=<CertificateIdentifier#>] [-
KEY=<AuthorizationKey>]]
```

## Parameters

| Parameter                    | Description                                                                                               |
|------------------------------|-----------------------------------------------------------------------------------------------------------|
| <Mgmt Server>                | Name or IP address of the Security Management Server or Domain Management Server.                         |
| <Username>                   | User name of standard Check Point authentication method.                                                  |
| <Password>                   | Password of standard Check Point authentication method.                                                   |
| <RoboName>                   | Name of the Security Gateway, SmartLSM Cluster, or SmartLSM Cluster Member.                               |
| <CaName>                     | Name of the Trusted CA object (created from SmartConsole) the IKE certificate request is sent to this CA. |
| <CertificateIdentifier><br>> | Key identifier of the specific certificate.                                                               |
| <AuthorizationKey>           | Authorization Key to be sent to the CA for the certificate retrieval.                                     |

## Example

```
LSMcli mySrvr name pass ResetIke MyROBO -CA=OPSEC_CA -R=cer3452s -
KEY=ad23fgh
```

# LSMcli Remove

## Description

This command deletes a SmartLSM Security Gateway.

This action revokes all the certificates used by the SmartLSM Security Gateway, releases all the licenses and, finally, removes the SmartLSM Security Gateway.

## Syntax

```
LSMcli [-d] <Mgmt Server> <Username> <Password> Remove <RoboName>
<ID>
```

## Parameters

| Parameter     | Description                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <Mgmt Server> | Name or IP address of the Security Management Server or Domain Management Server.                                                                            |
| <Username>    | User name of standard Check Point authentication method.                                                                                                     |
| <Password>    | Password of standard Check Point authentication method.                                                                                                      |
| <RoboName>    | Name of the Security Gateway.                                                                                                                                |
| <ID>          | ID of the SmartLSM Security Gateway.<br>Use the <a href="#">"LSMcli Show" on page 914</a> command to check the ID of the specific SmartLSM Security Gateway. |

## Example

```
LSMcli mySrvr name pass Remove MyRobo 0.0.0.251
```

# LSMcli ResetSic

## Description

This command resets the SIC Certificate of a SmartLSM Security Gateway or SmartLSM Cluster Member.

This action revokes the Security Gateway's SIC certificate and creates a new one with the one-time password provided by the user.

If an IP address is supplied for the SmartLSM Security Gateway, the SIC certificate is pushed to the SmartLSM Security Gateway, in which case the SmartLSM Security Gateway SIC one-time password must be initialized first.

Otherwise, if no IP address is given, the SIC certificate is later pulled from the SmartLSM Security Gateway.

## Syntax

```
LSMcli [-d] <Mgmt Server> <Username> <Password> ResetSic
<RoboName> <ActivationKey> [-I=<IPAddress>]
```

## Parameters

| Parameter            | Description                                                                                          |
|----------------------|------------------------------------------------------------------------------------------------------|
| <Mgmt Server>        | Name or IP address of the Security Management Server or Domain Management Server.                    |
| <Username>           | User name of standard Check Point authentication method.                                             |
| <Password>           | Password of standard Check Point authentication method.                                              |
| <RoboName>           | Name of the SmartLSM Security Gateway or SmartLSM Cluster Member.                                    |
| <ActivationKey><br>> | One-time password for the Secure Internal Communications with the SmartLSM Security Gateway.         |
| <IPAddress>          | IP address of Security Gateway (for this action, the certificate is pushed to the Security Gateway). |

## Example 1

```
LSMcli mySrvr name pass ResetSic MyROBO aw47q1
```

**Example 2**

```
LSMcli mySrvr name pass ResetSic MyFixedIPROBO sp36rt1 -  
I=10.20.30.1
```

# LSMcli Show

## Description

This command displays a list of existing Security Gateways.

## Syntax

```
LSMcli [-d] <Mgmt Server> <Username> <Password> Show [-N=<Gateway Name>] [-F=<FilterFlags>]
```

## Parameters

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <Mgmt Server>            | Name or IP address of the Security Management Server or Domain Management Server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <Username>               | User name of standard Check Point authentication method.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <Password>               | Password of standard Check Point authentication method.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <Gateway Name>           | Name of the Security Gateway to display.<br>If the "-N" flag is not included, the command prints the existing <b>Devices</b> work space, including SmartLSM Security Gateways.                                                                                                                                                                                                                                                                                                                                                                                                        |
| -<br>F=<<br>FilterFlags> | <p>You can use these flags to filter the printed information:</p> <ul style="list-style-type: none"> <li>■ b - ID</li> <li>■ c - Cluster ID</li> <li>■ d - List of Dynamic Objects assigned to this SmartLSM Security Gateways</li> <li>■ g - Gateway status</li> <li>■ i - IP address</li> <li>■ k - IKE DN</li> <li>■ l - Policy status</li> <li>■ n - Name</li> <li>■ p - SmartLSM Security Profile</li> <li>■ s - SIC DN</li> <li>■ t - Type</li> <li>■ v - Version</li> </ul> <p><b>Note</b> - To specify more than one filter flag, write them together.<br/>Example: -F=bn</p> |

**Example 1**

```
LSMcli mySrvr name pass Show -N=MyRobo
```

**Example 2**

```
LSMcli mySrvr name pass Show -F=binpt
```

# LSMcli ShowROBOTopology

## Description

This command displays the Topology information of the SmartLSM Security Gateway.

It lists the defined Interfaces and their respective IP Addresses and Network Masks, and the VPN Domain configuration.

You can use the indexes of the manually defined VPN domain IP address ranges, on the displayed list, when you request to delete a range, with the ["LSMcli ModifyROBOManualVPNDomain" on page 903](#) command.

## Syntax

```
LSMcli [-d] <Mgmt Server> <Username> <Password> ShowROBOTopology  
<RoboName>
```

## Parameters

| Parameter     | Description                                                                       |
|---------------|-----------------------------------------------------------------------------------|
| <Mgmt Server> | Name or IP address of the Security Management Server or Domain Management Server. |
| <Username>    | User name of standard Check Point authentication method.                          |
| <Password>    | Password of standard Check Point authentication method.                           |
| <RoboName>    | Name of Security Gateway.                                                         |

## Example

```
LSMcli mySrvr name pass ShowROBOTopology MyRobo
```

# LSMcli UpdateCO

## Description

This command updates a Corporate Office (CO) Security Gateway.

This action updates the CO Security Gateway with up-to-date available information about the VPN Domains of the SmartLSM Security Gateways.

Perform this action after you add a new SmartLSM Security Gateway to enable the CO gateway to initiate a VPN tunnel to the new SmartLSM Security Gateway.

Alternatively, you can Install Policy on the CO gateway to obtain updated VPN Domain information.

**Note** - This command supports CO Security Gateways only.

## Syntax

```
LSMcli [-d] <Mgmt Server> <Username> <Password> UpdateCO {<COgw>
| COgwCluster}
```

## Parameters

| Parameter     | Description                                                                       |
|---------------|-----------------------------------------------------------------------------------|
| <Mgmt Server> | Name or IP address of the Security Management Server or Domain Management Server. |
| <Username>    | User name of standard Check Point authentication method.                          |
| <Password>    | Password of standard Check Point authentication method.                           |
| <CoGw>        | Name of a CO gateway.                                                             |
| <CoGwCluster> | Name of a cluster of CO gateways.                                                 |

## Example

```
LSMcli mySrvr name pass UpdateCO MyCO
```

# SmartUpdate Actions

This section describes commands that perform SmartUpdateactions on SmartLSM Gateways.

Before you can install software on gateways, you must first load it to the Security Management Server.

**Best Practice** - Run the *"LSMcli VerifyInstall" on page 923* command to make sure that the software is compatible.

Use the *"LSMcli Install" on page 919* command to install the software.

Use the *"LSMcli Uninstall" on page 921* command to uninstall the software.

# LSMcli Install

## Description

This command installs the specified software on the SmartLSM Security Gateway or SmartLSM Cluster Member.

-  **Note** - Before you can install software on SmartLSM Security Gateways, you must first load it to the Security Management Server.
-  **Best Practice** - Run the ["LSMcli VerifyInstall" on page 923](#) command to make sure that the software is compatible.

## Syntax

```
LSMcli [-d] <Mgmt Server> <Username> <Password> Install <RoboName>
<Product> <Vendor> <Version> <SP> [-P=<Profile>] [-boot] [-
DoNotDistribute]
```

## Parameters

| Parameter        | Description                                                                                        |
|------------------|----------------------------------------------------------------------------------------------------|
| <Mgmt Server>    | Name or IP address of the Security Management Server or Domain Management Server.                  |
| <Username>       | User name of standard Check Point authentication method.                                           |
| <Password>       | Password of standard Check Point authentication method.                                            |
| <RoboName>       | Name of the SmartLSM Security Gateway.                                                             |
| <Product>        | Name of the package.                                                                               |
| <Vendor>         | Name of the vendor of the package.                                                                 |
| <Version>        | Major Version of the package.                                                                      |
| <SP>             | Minor Version of the package.                                                                      |
| <Profile>        | Assign a different SmartLSM Security Profile (already defined in SmartConsole) after installation. |
| boot             | Reboot the SmartLSM Security Gateway after installation.                                           |
| -DoNotDistribute | Optional.<br>Install previously distributed packages.                                              |

**Example**

```
LSMcli mySrvr name pass Install MyRobo firewall checkpoint NG_AI  
fcs -P=AnyProfile -boot
```

# LSMcli Uninstall

## Description

This command uninstalls the specified package from the SmartLSM Security Gateway or SmartLSM Cluster Member.

You can use the ["LSMcli ShowInfo" on page 927](#) command to see what products are installed on the SmartLSM Security Gateway.

## Syntax

```
LSMcli [-d] <Mgmt Server> <Username> <Password> Uninstall
<RoboName> <Product> <Vendor> <Version> <SP> [-P=<Profile>] [-
boot]
```

## Parameters

| Parameter     | Description                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------|
| <Mgmt Server> | Name or IP address of the Security Management Server or Domain Management Server.               |
| <Username>    | User name of standard Check Point authentication method.                                        |
| <Password>    | Password of standard Check Point authentication method.                                         |
| <RoboName>    | Name of the SmartLSM Security Gateway.                                                          |
| <Product>     | Name of the package.                                                                            |
| <Vendor>      | Name of the vendor of the package.                                                              |
| <Version>     | Major Version of the package.                                                                   |
| <SP>          | Minor Version of the package.                                                                   |
| <Profile>     | Assign a different SmartLSM Security Profile (already defined in SmartConsole) after uninstall. |
| boot          | Reboot the SmartLSM Security Gateway after installation.                                        |

## Example

```
LSMcli mySrvr name pass Uninstall MyRobo firewall checkpoint NG_AI
fcs -boot
```

# LSMcli Distribute

## Description

This command distributes a package from the Repository to the SmartLSM Security Gateway or SmartLSM Cluster Member, but does not install it.

## Syntax

```
LSMcli [-d] <Mgmt Server> <Username> <Password> Distribute
<RoboName> <Product> <Vendor> <Version> <SP>
```

## Parameters

| Parameter     | Description                                                                       |
|---------------|-----------------------------------------------------------------------------------|
| <Mgmt Server> | Name or IP address of the Security Management Server or Domain Management Server. |
| <Username>    | User name of standard Check Point authentication method.                          |
| <Password>    | Password of standard Check Point authentication method.                           |
| <RoboName>    | Name of the SmartLSM Security Gateway.                                            |
| <Product>     | Name of the package.                                                              |
| <Vendor>      | Name of the vendor of the package.                                                |
| <Version>     | Major version of the package.                                                     |
| <SP>          | Minor version of the package.                                                     |

## Example

```
LSMcli mySrvr name pass Distribute MyRobo fw1 checkpoint NG_AI R54
```

# LSMcli VerifyInstall

## Description

This command makes sure that the software is compatible to install on the SmartLSM Security Gateway or SmartLSM Cluster Member.

**Note** - Note that this action does not perform an installation.

**Best Practice** - Run this command before you install the software on the SmartLSM Security Gateway.

## Syntax

```
LSMcli [-d] <Mgmt Server> <Username> <Password> VerifyInstall
<RoboName> <Product> <Vendor> <Version> <SP>
```

## Parameters

| Parameter     | Description                                                                       |
|---------------|-----------------------------------------------------------------------------------|
| <Mgmt Server> | Name or IP address of the Security Management Server or Domain Management Server. |
| <Username>    | User name of standard Check Point authentication method.                          |
| <Password>    | Password of standard Check Point authentication method.                           |
| <RoboName>    | Name of the SmartLSM Security Gateway.                                            |
| <Product>     | Name of the package.                                                              |
| <Vendor>      | Name of the vendor of the package.                                                |
| <Version>     | Major version of the package.                                                     |
| <SP>          | Minor version of the package.                                                     |

## Example

```
LSMcli mySrvr name pass VerifyInstall MyRobo firewall checkpoint
NG_AI fcs
```

# LSMcli VerifyUpgrade

## Description

This command verifies if you can upgrade a selected software on the SmartLSM Security Gateway or SmartLSM Cluster Member.

**Note** - This command does not perform an installation.

**Best Practice** - Run this command before you run the ["LSMcli Upgrade" on page 925](#) command.

## Syntax

```
LSMcli [-d] <Mgmt Server> <Username> <Password> VerifyUpgrade  
<RoboName>
```

## Parameters

| Parameter     | Description                                                                       |
|---------------|-----------------------------------------------------------------------------------|
| <Mgmt Server> | Name or IP address of the Security Management Server or Domain Management Server. |
| <Username>    | User name of standard Check Point authentication method.                          |
| <Password>    | Password of standard Check Point authentication method.                           |
| <RoboName>    | Name of the SmartLSM Security Gateway.                                            |

## Example

```
LSMcli mySrvr name pass VerifyUpgrade MyRobo
```

# LSMcli Upgrade

## Description

This command upgrades all the (appropriate) available software packages on the SmartLSM Security Gateway or SmartLSM Cluster Member.

- ★ **Best Practice** - Run the "[LSMcli VerifyUpgrade" on page 924](#) command before you run this command.

## Syntax

```
LSMcli [-d] <Mgmt Server> <Username> <Password> Upgrade <RoboName>
[-P=<Profile>] [-boot]
```

## Parameters

| Parameter     | Description                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------|
| <Mgmt Server> | Name or IP address of the Security Management Server or Domain Management Server.                  |
| <Username>    | User name of standard Check Point authentication method.                                           |
| <Password>    | Password of standard Check Point authentication method.                                            |
| <RoboName>    | Name of the SmartLSM Security Gateway.                                                             |
| <Profile>     | Assign a different SmartLSM Security Profile (already defined in SmartConsole) after installation. |
| boot          | Reboot the SmartLSM Security Gateway after the installation is finished.                           |

## Example

```
LSMcli mySrvr name pass Upgrade MyRobo -P=myprofile -boot
```

# LSMcli GetInfo

## Description

This command collects product information from the SmartLSM Security Gateway or SmartLSM Cluster Member.

 **Important** - If you upgrade any package manually instead of using SmartUpdate, you must run this command before you run the *"LSMcli ShowInfo" on page 927* command.

## Syntax

```
LSMcli [-d] <Mgmt Server> <Username> <Password> GetInfo <RoboName>
```

## Parameters

| Parameter     | Description                                                                       |
|---------------|-----------------------------------------------------------------------------------|
| <Mgmt Server> | Name or IP address of the Security Management Server or Domain Management Server. |
| <Username>    | User name of standard Check Point authentication method.                          |
| <Password>    | Password of standard Check Point authentication method.                           |
| <RoboName>    | Name of the SmartLSM Security Gateway.                                            |

## Example

```
LSMcli mySrvr name pass GetInfo MyRobo
```

# LSMcli ShowInfo

## Description

This command displays product information for the list of the products installed on the SmartLSM Security Gateway or SmartLSM Cluster Member.

 **Important** - Before you run this command, run the ["LSMcli GetInfo" on page 926](#) command to make sure the information is up-to-date.

## Syntax

```
LSMcli [-d] <Mgmt Server> <Username> <Password> ShowInfo  
<RoboName>
```

## Parameters

| Parameter     | Description                                                                       |
|---------------|-----------------------------------------------------------------------------------|
| <Mgmt Server> | Name or IP address of the Security Management Server or Domain Management Server. |
| <Username>    | User name of standard Check Point authentication method.                          |
| <Password>    | Password of standard Check Point authentication method.                           |
| <RoboName>    | Name of the Security Gateway.                                                     |

## Example

```
LSMcli mySrvr name pass ShowInfo MyRobo
```

# LSMcli ShowRepository

## Description

This command shows the list of the available products on the Management Server.

Use SmartUpdate to manage the products, load new products, remove products, and so on.

## Syntax

```
LSMcli [-d] <Mgmt Server> <Username> <Password> ShowRepository
```

## Parameters

| Parameter     | Description                                                                       |
|---------------|-----------------------------------------------------------------------------------|
| <Mgmt Server> | Name or IP address of the Security Management Server or Domain Management Server. |
| <Username>    | User name of standard Check Point authentication method.                          |
| <Password>    | Password of standard Check Point authentication method.                           |

## Example

```
LSMcli mySrvr name pass ShowRepository
```

# LSMcli Stop

## Description

This command stops Security Gateway services on the selected gateway.

### Notes:

- The `CPRID` services must run on the selected gateway. See "[cprid](#)" on [page 186](#).
- This command supports Security Gateways, SmartLSM Security Gateways, and SmartLSM Cluster Members.

## Syntax

```
LSMcli [-d] <Mgmt Server> <Username> <Password> Stop {<RoboName>
| <GatewayName>}
```

## Parameters

| Parameter                             | Description                                                                       |
|---------------------------------------|-----------------------------------------------------------------------------------|
| <code>&lt;Mgmt Server&gt;</code>      | Name or IP address of the Security Management Server or Domain Management Server. |
| <code>&lt;Username&gt;</code>         | User name of standard Check Point authentication method.                          |
| <code>&lt;Password&gt;</code>         | Password of standard Check Point authentication method.                           |
| <code>&lt;RoboName&gt;</code>         | Name of the SmartLSM Security Gateway.                                            |
| <code>&lt;GatewayName&gt;</code><br>> | Name of the standard Security Gateway.                                            |

## Example

```
LSMcli mySrvr name pass Stop MyRobo
```

# LSMcli Start

## Description

This command starts Security Gateway services on the selected gateway.

### Notes:

- The `CPRID` services must run on the selected gateway. See "[cprid](#)" on [page 186](#).
- This command supports Security Gateways, SmartLSM Security Gateways, and SmartLSM Cluster Members.

## Syntax

```
LSMcli [-d] <Mgmt Server> <Username> <Password> Start {<RoboName>
| <GatewayName>}
```

## Parameters

| Parameter                             | Description                                                                       |
|---------------------------------------|-----------------------------------------------------------------------------------|
| <code>&lt;Mgmt Server&gt;</code>      | Name or IP address of the Security Management Server or Domain Management Server. |
| <code>&lt;Username&gt;</code>         | User name of standard Check Point authentication method.                          |
| <code>&lt;Password&gt;</code>         | Password of standard Check Point authentication method.                           |
| <code>&lt;RoboName&gt;</code>         | Name of the SmartLSM Security Gateway.                                            |
| <code>&lt;GatewayName&gt;</code><br>> | Name of the standard Security Gateway.                                            |

## Example

```
LSMcli mySrvr name pass Start MyRobo
```
