Important Information

Latest Software
We recommend that you install the most recent software release to stay up-to-date with the latest functional improvements, stability fixes, security enhancements and protection against new and evolving attacks.

Certifications
For third party independent certification of Check Point products, see the Check Point Certifications page.

Check Point R82
For more about this release, see the R82 home page.

Download the latest version of this document in PDF format.

Feedback
Check Point is engaged in a continuous effort to improve its documentation.
Please help us by sending your comments.

Patent Notice
Check Point Quantum Security Gateway is protected by the following patents in the United States and elsewhere.
This page is intended to serve as notice under 35 U.S.C. § 287(a):
US7,647,492, US7,769,862, US7,797,566, US7,950,059, US8,051,187, US8,146,159, US8,161,188, US8,176,539, US8,200,818, US8,254,698, US8,406,233, US8,533,808, US8,615,655, US8,644,328, US8,726,008, US8,776,017, US8,843,993, US8,844,019, US8,850,576, US8,902,900, US8,948,193, US8,959,047, US9,137,204, US9,208,317, US9,210,128, US9,356,945, US9,483,583, US9,537,756, US9,569,265, US9,647,985, US9,672,189, US9,832,215, US9,935,903, US10,057,390, US10,382,493, US10,467,407, US10,567,395, US10,567,468, US10,645,074, US10,728,266, US10,728,274, US11,075,882, US11,165,820, US11,321,453, US11,323,426, US11,411,924, US11,606,375

Table of Contents

Glossary

A

Anti-Bot
Check Point Software Blade on a Security Gateway that blocks botnet behavior and communication to Command and Control (C&C) centers. Acronyms: AB, ABOT.

Anti-Spam
Check Point Software Blade on a Security Gateway that provides comprehensive protection for email inspection. Synonym: Anti-Spam & Email Security. Acronyms: AS, ASPAM.

Anti-Virus
Check Point Software Blade on a Security Gateway that uses real-time virus signatures and anomaly-based protections from ThreatCloud to detect and block malware at the Security Gateway before users are affected. Acronym: AV.

Application Control
Check Point Software Blade on a Security Gateway that allows granular control over specific web-enabled applications by using deep packet inspection. Acronym: APPI.

Audit Log
Log that contains administrator actions on a Management Server (login and logout, creation or modification of an object, installation of a policy, and so on).

B

Breakout Cable
An optical fiber cable that contains several jacketed simplex optical fibers that are packaged together inside an outer jacket. Synonyms: Fanout cable, Fan-Out cable, Splitter cable.

Bridge Mode
Security Gateway or Virtual System that works as a Layer 2 bridge device for easy deployment in an existing topology.

C

Chassis Management Module
On Scalable Chassis - a hardware component that controls and monitors 60000 / 40000 Appliance (Chassis) operation such as, fan speed, Chassis and module temperature, and component hot-swapping. Acronym: CMM.

Cluster
Two or more Security Gateways that work together in a redundant configuration - High Availability, or Load Sharing.

Cluster Member
Security Gateway that is part of a cluster.

Compliance
Check Point Software Blade on a Management Server to view and apply the Security Best Practices to the managed Security Gateways. This Software Blade includes a library of Check Point-defined Security Best Practices to use as a baseline for good Security Gateway and Policy configuration.

Content Awareness
Check Point Software Blade on a Security Gateway that provides data visibility and enforcement. Acronym: CTNT.

CoreXL
Performance-enhancing technology for Security Gateways on multi-core processing platforms. Multiple Check Point Firewall instances are running in parallel on multiple CPU cores.

CoreXL Firewall Instance
On a Security Gateway with CoreXL enabled, the Firewall kernel is copied multiple times. Each replicated copy, or firewall instance, runs on one processing CPU core. These firewall instances handle traffic at the same time, and each firewall instance is a complete and independent firewall inspection kernel. Synonym: CoreXL FW Instance.

CoreXL SND
Secure Network Distributer. Part of CoreXL that is responsible for: Processing incoming traffic from the network interfaces; Securely accelerating authorized packets (if SecureXL is enabled); Distributing non-accelerated packets between Firewall kernel instances (SND maintains global dispatching table, which maps connections that were assigned to CoreXL Firewall instances). Traffic distribution between CoreXL Firewall instances is statically based on Source IP addresses, Destination IP addresses, and the IP 'Protocol' type. The CoreXL SND does not really "touch" packets. The decision to stick to a particular FWK daemon is done at the first packet of connection on a very high level, before anything else. Depending on the SecureXL settings, and in most of the cases, the SecureXL can be offloading decryption calculations. However, in some other cases, such as with Route-Based VPN, it is done by FWK daemon.

CPUSE
Check Point Upgrade Service Engine for Gaia Operating System. With CPUSE, you can automatically update Check Point products for the Gaia OS, and the Gaia OS itself.

D

DAC Cable
Direct Attach Copper cable. A form of the high-speed shielded twinax copper cable with pluggable transceivers on both ends. Used to connect to network devices (switches, routers, or servers).

DAIP Gateway
Dynamically Assigned IP (DAIP) Security Gateway is a Security Gateway, on which the IP address of the external interface is assigned dynamically by the ISP.

Data Loss Prevention
Check Point Software Blade on a Security Gateway that detects and prevents the unauthorized transmission of confidential information outside the organization. Acronym: DLP.

Data Type
Classification of data in a Check Point Security Policy for the Content Awareness Software Blade.

Distributed Deployment
Configuration in which the Check Point Security Gateway and the Security Management Server products are installed on different computers.

Downlink Ports
Interfaces on the Quantum Maestro Orchestrator used to connect to Check Point Security Appliances. You use DAC cables, Fiber cables (with transceivers), or Breakout cables to connect between the Downlink ports and Security Appliances. The Check Point Management traffic (policy, logs, synchronization, and so on) co-exists with the data (user) traffic on the Downlink ports. Bandwidth is guaranteed for the Check Point Management traffic (portion of the downlink bandwidth). These ports form the system backplane (management, data plane, synchronization).

Dynamic Object
Special object type, whose IP address is not known in advance. The Security Gateway resolves the IP address of this object in real time.

E

Endpoint Policy Management
Check Point Software Blade on a Management Server to manage an on-premises Harmony Endpoint Security environment.

Expert Mode
The name of the elevated command line shell that gives full system root permissions in the Check Point Gaia operating system.

G

Gaia
Check Point security operating system that combines the strengths of both SecurePlatform and IPSO operating systems.

Gaia Clish
The name of the default command line shell in Check Point Gaia operating system. This is a restricted shell (role-based administration controls the number of commands available in the shell).

Gaia gClish
The name of the global command line shell in Check Point Gaia operating system for Security Appliances connected to Check Point Quantum Maestro Orchestrators and for Security Gateway Modules on Scalable Chassis. Commands you run in this shell apply to all Security Gateway Module / Security Appliances in the Security Group.

Gaia Portal
Web interface for the Check Point Gaia operating system.

H

Hotfix
Software package installed on top of the current software version to fix a wrong or undesired behavior, and to add a new behavior.

HTTPS Inspection
Feature on a Security Gateway that inspects traffic encrypted by the Secure Sockets Layer (SSL) protocol for malware or suspicious patterns. Synonym: SSL Inspection. Acronyms: HTTPSI, HTTPSi.

HyperSync
Check Point patented technology that makes sure that active connections are only synchronized to backup Security Appliances in the Security Group. HyperSync makes sure each connection flow has a backup within the Security Group.

I

ICA
Internal Certificate Authority. A component on Check Point Management Server that issues certificates for authentication.

Identity Awareness
Check Point Software Blade on a Security Gateway that enforces network access and audits data based on network location, the identity of the user, and the identity of the computer. Acronym: IDA.

Identity Logging
Check Point Software Blade on a Management Server to view Identity Logs from the managed Security Gateways with enabled Identity Awareness Software Blade.

Internal Network
Computers and resources protected by the Firewall and accessed by authenticated users.

IPS
Check Point Software Blade on a Security Gateway that inspects and analyzes packets and data for numerous types of risks (Intrusion Prevention System).

IPsec VPN
Check Point Software Blade on a Security Gateway that provides a Site to Site VPN and Remote Access VPN access.

J

Jumbo Hotfix Accumulator
Collection of hotfixes combined into a single package. Acronyms: JHA, JHF, JHFA.

K

Kerberos
An authentication server for Microsoft Windows Active Directory Federation Services (ADFS).

L

Log Server
Dedicated Check Point server that runs Check Point software to store and process logs.

Logging & Status
Check Point Software Blade on a Management Server to view Security Logs from the managed Security Gateways.

M

Maestro Orchestrator
A scalable Network Security System that connects multiple Check Point Security Appliances into a unified system. Synonyms: Orchestrator, Quantum Maestro Orchestrator, Maestro Hyperscale Orchestrator. Acronym: MHO.

Management Interface
(1) Interface on a Gaia Security Gateway or Cluster member, through which Management Server connects to the Security Gateway or Cluster member. (2) Interface on Gaia computer, through which users connect to Gaia Portal or CLI.

Management Server
Check Point Single-Domain Security Management Server or a Multi-Domain Security Management Server.

Manual NAT Rules
Manual configuration of NAT rules by the administrator of the Check Point Management Server.

Mobile Access
Check Point Software Blade on a Security Gateway that provides a Remote Access VPN access for managed and unmanaged clients. Acronym: MAB.

Multi-Domain Log Server
Dedicated Check Point server that runs Check Point software to store and process logs in a Multi-Domain Security Management environment. The Multi-Domain Log Server consists of Domain Log Servers that store and process logs from Security Gateways that are managed by the corresponding Domain Management Servers. Acronym: MDLS.

Multi-Domain Server
Dedicated Check Point server that runs Check Point software to host virtual Security Management Servers called Domain Management Servers. Synonym: Multi-Domain Security Management Server. Acronym: MDS.

N

Network Object
Logical object that represents different parts of corporate topology - computers, IP addresses, traffic protocols, and so on. Administrators use these objects in Security Policies.

Network Policy Management
Check Point Software Blade on a Management Server to manage an on-premises environment with an Access Control and Threat Prevention policies.

O

Open Server
Physical computer manufactured and distributed by a company, other than Check Point.

Orchestrator
See "Maestro Orchestrator".

P

Power Entry Module
Hardware component that supplies DC power with EMC filtering and over-current protection on Scalable Chassis. Acronym: PEM.

Power Supply Unit
Hardware component that supplies AC power with filtering and over-current protection. Acronym: PSU.

Provisioning
Check Point Software Blade on a Management Server that manages large-scale deployments of Check Point Security Gateways using configuration profiles. Synonyms: SmartProvisioning, SmartLSM, Large-Scale Management, LSM.

Q

QoS
Check Point Software Blade on a Security Gateway that provides policy-based traffic bandwidth management to prioritize business-critical traffic and guarantee bandwidth and control latency.

R

Rule
Set of traffic parameters and other conditions in a Rule Base (Security Policy) that cause specified actions to be taken for a communication session.

Rule Base
All rules configured in a given Security Policy. Synonym: Rulebase.

S

Scalable Chassis
The container that contains the all the components of a 60000 / 40000 Appliance. Synonym: Chassis.

SecureXL
Check Point product on a Security Gateway that accelerates IPv4 and IPv6 traffic that passes through a Security Gateway.

Security Gateway
Dedicated Check Point server that runs Check Point software to inspect traffic and enforce Security Policies for connected network resources.

Security Gateway Module
On Scalable Chassis - a hardware component on a 60000 / 40000 Appliance (Chassis) that operates as a physical Security Gateway. A Chassis contains many Security Gateway Modules that work together as a single, high performance Security Gateway or VSX Gateway. In Maestro - a role of a Security Appliance. Part of the Security Group that contains the assigned Security Appliances. A Security Appliance in a Security Group has one IPv4 address and represents all assigned Security Appliances as one entity. Acronym: SGM.

Security Group
A logical group of Security Appliances (in Maestro) / Security Gateway Modules (on Scalable Chassis) that provides Active/Active cluster functionality. A Security Group can contain one or more Security Appliances / Security Gateway Modules. Security Groups work separately and independently from each other. To the production networks, a Security Group appears a single Security Gateway. In Maestro, each Security Group contains: (A) Applicable Uplink ports, to which your production networks are connected; (B) Security Appliances (the Quantum Maestro Orchestrator determines the applicable Downlink ports automatically); (C) Applicable management port, to which the Check Point Management Server is connected.

Security Group Member
Member of a Security Group in ElasticXL Cluster, Maestro, and Scalable Chassis. Acronym: SGM.

Security Management Server
Dedicated Check Point server that runs Check Point software to manage the objects and policies in a Check Point environment within a single management Domain. Synonym: Single-Domain Security Management Server.

Security Policy
Collection of rules that control network traffic and enforce organization guidelines for data protection and access to resources with packet inspection.

Security Switch Module
On Scalable Chassis - a hardware component on a 60000 / 40000 Appliance (Chassis) that manages the flow of network traffic to and from the Security Gateway Module in the Chassis. In Maestro - a role of the Quantum Maestro Orchestrator that manages the flow of network traffic to and from the Security Groups. Acronym: SSM.

SGM
In Maestro - a role of a Security Appliance. Part of the Security Group that contains the assigned Security Appliances. A Security Appliance in a Security Group has one IPv4 address and represents all assigned Security Appliances as one entity. For Scalable Chassis - see "Security Gateway Module".

Shared Management
Feature that makes it possible to assign the same Management Port (interface ethX-MgmtY) on a Quantum Maestro Orchestrator to different Security Groups. The assigned Management Port has a different IP address and a different MAC address in each Security Group, to which this port is assigned.

SIC
Secure Internal Communication. The Check Point proprietary mechanism with which Check Point computers that run Check Point software authenticate each other over SSL, for secure communication. This authentication is based on the certificates issued by the ICA on a Check Point Management Server.

Single Management Object
Single Security Gateway object in SmartConsole that represents a Security Group configured on a Quantum Maestro Orchestrator / Scalable Chassis. Acronym: SMO.

SmartConsole
Check Point GUI application used to manage a Check Point environment - configure Security Policies, configure devices, monitor products and events, install updates, and so on.

SmartDashboard
Legacy Check Point GUI client used to create and manage the security settings in versions R77.30 and lower. In versions R80.X and higher is still used to configure specific legacy settings.

SmartProvisioning
Check Point Software Blade on a Management Server (the actual name is "Provisioning") that manages large-scale deployments of Check Point Security Gateways using configuration profiles. Synonyms: Large-Scale Management, SmartLSM, LSM.

SmartUpdate
Legacy Check Point GUI client used to manage licenses and contracts in a Check Point environment.

SMO Master
The Security Appliance (in Maestro) / Security Gateway Module (on Scalable Chassis) in a Security Group that handles management tasks for all Security Appliances / Security Gateway Modules in the Security Group. By default, this role is assigned to the Security Appliance / Security Gateway Module with the lowest Member ID in the Security Group. See "SMO".

Software Blade
Specific security solution (module): (1) On a Security Gateway, each Software Blade inspects specific characteristics of the traffic (2) On a Management Server, each Software Blade enables different management capabilities.

SSM
In Maestro - a role of the Quantum Maestro Orchestrator that manages the flow of network traffic to and from the Security Groups. For Scalable Chassis - see "Security Switch Module".

Standalone
Configuration in which the Security Gateway and the Security Management Server products are installed and configured on the same server.

T

Threat Emulation
Check Point Software Blade on a Security Gateway that monitors the behavior of files in a sandbox to determine whether or not they are malicious. Acronym: TE.

Threat Extraction
Check Point Software Blade on a Security Gateway that removes malicious content from files. Acronym: TEX.

U

Updatable Object
Network object that represents an external service, such as Microsoft 365, AWS, Geo locations, and more.

Uplink Ports
Interfaces on the Quantum Maestro Orchestrator used to connect to external and internal networks. Gaia operating system shows these interfaces in Gaia Portal and in Gaia Clish. SmartConsole shows these interfaces in the corresponding SMO Security Gateway object.

URL Filtering
Check Point Software Blade on a Security Gateway that allows granular control over which web sites can be accessed by a given group of users, computers or networks. Acronym: URLF.

User Directory
Check Point Software Blade on a Management Server that integrates LDAP and other external user management servers with Check Point products and security solutions.

V

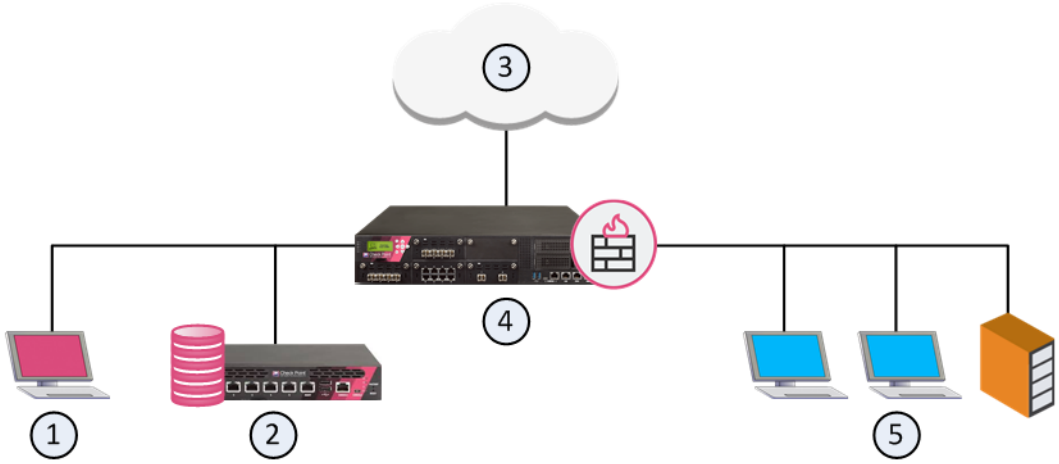
VSX
Virtual System Extension. Check Point virtual networking solution, hosted on a computer or cluster with virtual abstractions of Check Point Security Gateways and other network devices. These Virtual Devices provide the same functionality as their physical counterparts.

VSX Gateway
Physical server that hosts VSX virtual networks, including all Virtual Devices that provide the functionality of physical network devices. It holds at least one Virtual System, which is called VS0.

Z

Zero Phishing
Check Point Software Blade on a Security Gateway (R81.20 and higher) that provides real-time phishing prevention based on URLs. Acronym: ZPH.

Check Point Quantum Security Gateway Solution



Item	Description
1	SmartConsole
2	Security Management Server
3	Internet and external networks
4	Security Gateway, Cluster, or Scalable Platform Security Group)
5	Internal network

These are the primary components of a Check Point Firewall solution:

- **Security Gateway**, **Cluster**, or **Scalable Platform Security Group** - The engine that enforces the organization's security policy, is an entry point to the LAN, and is managed by the Security Management Server.
- **Security Management Server** - The server that manages, stores, and distributes the security policy to the Security Gateway, Cluster, or Scalable Platform Security Group.
- **SmartConsole** - A GUI application that manages security policies, monitor products and events, install updates, provision new devices and appliances, and manage a multi-domain environment.

Notes:

- For information about Cluster, see the *R82 ClusterXL Administration Guide*.
- For information about Scalable Platforms, see the *R82 Scalable Platforms Administration Guide*.
- For information about Security Management Server and SmartConsole, see the *R82 Security Management Administration Guide*.

Security Policy

In This Section:

Security Policy is a collection of rules and settings that control network traffic and enforce organization guidelines for data protection and access to resources with packet inspection.

Check Point solution provides several types of Security Policies.

Access Control Policy

Description

Access Control Policy consists of these parts:

- **Access Control Rule Base**

  For more information, see the *R82 Security Management Administration Guide*.

  In addition, see sk120964 - ATRG: Unified Policy.

  Contains unified simple and granular rules to control access from specified sources to specified destinations over specified protocols.

  If you enable Identity Awareness Software Blade on your Security Gateways, you can also use Access Role objects as the source and destination in a rule. This lets you easily make rules for individuals or different groups of users.

  How to get there:

  1. Connect with SmartConsole to the Management Server.
  2. From the left navigation panel, click **Security Policies**.
  3. In the **Access Control** section, click **Policy**.

  Rule structure:

No	Name	Source	Destination	VPN	Services & Applications	Action	Time	Track	Install On
#	Your Rule Name	Specific Source objects	Specific Destination objects	Specific or All VPN Communities	Specific or All Service objects Specific or All Application objects	`Accept` or `Drop` or `Reject` or `User Auth` or `Client Auth`	`Any` or Specific Time object	`Log` (with `Accounting`) or `Alert` or `None`	`Policy Targets`

- **NAT Rule Base**

  For more information, see the *R82 Security Management Administration Guide*.

  Contains automatic and manual rules for Network Address Translation (NAT).

  How to get there:

  1. Connect with SmartConsole to the Management Server.
  2. From the left navigation panel, click **Security Policies**.
  3. In the **Access Control** section, click **NAT**.

  Rule structure:

No	Original Source	Original Destination	Original Services	Translated Source	Translated Destination	Translated Services	Install On	Comments
Automatic Generated Rules								
NAT Rules for X (Y-Z)								
#	Specific Source objects	Specific Destination objects	Specific or All Service objects	`= Original` or Specific object	`= Original` or Specific object	`= Original` or Specific object	`Policy Targets` or Specific Security Gateway and Cluster objects	Your Comment

- **Desktop Rule Base**

  For more information, see the SmartDashboard Help (press F1).

  Prerequisites:

  1. In the Security Gateway (Cluster) object, enable the **IPsec VPN** and the **Policy Server** Software Blades.
  2. In the Policy Package, enable the **Desktop Security**.

  This policy is installed on the Security Management Server. Remote Access Clients download this policy when a VPN Site update is performed. Once downloaded, this policy determines access control on the Remote Access Client machines.

  The Desktop Policy consists of two Rule Bases:

  - **Inbound Rules** - Control connections directed at the client machine
  - **Outbound Rules** - Control connections initiated by the client machine

  How to get there:

  1. Connect with SmartConsole to the Management Server.
  2. From the left navigation panel, click **Security Policies**.
  3. In the **Access Control** section, click **Desktop**.
  4. Click **Open Desktop Policy in SmartDashboard**.
  5. From the top, click the **Desktop** tab.

  Rule structure:

No	Source	Desktop	Service	Action	Track	Comment

#	`Any`
	or
	Specific Source objects
		`All Users@Any`
		or
		Specific User Group objects
			`Any`
			or
			Specific Service objects
				`Accept`
				or
				`Block`
				or
				`Encrypt`
					`None`
					or
					`Log`
					or
					`Alert`
						Your Comment

Threat Prevention Policy

Description

For more information, see the *R82 Threat Prevention Administration Guide*.

Determines how the system inspects connections for bots and viruses. The primary component of the policy is the Rule Base. The rules use the Malware database and network objects.

If you enable Identity Awareness Software Blade on your Security Gateways, you can also use Access Role objects as the scope in a rule. This lets you easily make rules for individuals or different groups of users.

How to get there:

1. Connect with SmartConsole to the Management Server.
2. From the left navigation panel, click **Security Policies**.
3. In the **Threat Prevention** section, click **Policy**.

Rule structure:

No	Name	Protected Scope	Source	Destination	Protection/ Site/ File/ Blade	Services	Action	Track	Install On	Comments
#	Your Rule Name	Specific objects	Specific Source objects	Specific Destination objects	`N/A` (or your specific objects in an exception rule)	`Any` or Specific Service objects	`Basic` or `Optimized` or `Strict` or *Your Profile*	`None` or `Log` or `Alert` In addition: `Packet Capture` `Forensics`	`Policy Targets` or Specific Security Gateway and Cluster objects	Your Comment

HTTPS Inspection Policy

Description

For more information, see the *R82 Threat Prevention Administration Guide*.

Inspects the HTTPS traffic with these Software Blades:

- Anti-Bot
- Anti-Virus
- Application Control
- Content Awareness (Data Awareness)
- Data Loss Prevention
- IPS
- Threat Emulation
- URL Filtering

Security Gateways cannot inspect HTTPS traffic because it is encrypted. You can enable the HTTPS Inspection feature to let the Security Gateways create new SSL connections with the external site or server. The Security Gateways are then able to decrypt and inspect HTTPS traffic that uses the new SSL connections.

Security Gateways use the Trusted CA package when they connect to HTTPS servers on behalf of internal clients. See sk64521.

How to get there:

1. Connect with SmartConsole to the Management Server.
2. From the left navigation panel, click **Security Policies**.
3. In the **HTTPS Inspection** section, click **Policy**.

   Note - In addition, in the **HTTPS Tools** section, click **Additional Settings**.

Rule structure:

No	Name	Source	Destination	Services	Category/ Custom Application	Action	Track	Blade	Install On	Certificate	Comment
#	Your Rule Name	`Any`	`APPI_global_obj_Internet` or Specific Destination objects	`TLS default services` or Specific Service objects	`Any` or Specific objects	`Inspect` or `Bypass`	`None` or `Log` or `Alert`	`All` or Specific Blade	`Policy TLS Targets` or Specific Security Gateway and Cluster objects	`Outbound Certificate` or Your Certificate for Inbound Inspection	Your Comment

Data Loss Prevention Policy

Description

For more information, see the *R82 Data Loss Prevention Administration Guide*.

Prevents unintentional data leaks by catching protected data before it leaves your organization.

How to get there:

1. Connect with SmartConsole to the Management Server.
2. From the left navigation panel, click **Manage & Settings**.
3. From the left tree, click **Blades**.
4. In the **Data Loss Prevention** section, click **Configure in SmartDashboard**.
5. From the top, click the **Data Loss Prevention** tab.
6. From the left tree, click **Policy**.

Rule structure:

Flag	Name	Data	Source	Destination	Protocol	Exceptions	Action	Track	Severity	Install On	Time	Category	Comment
Category Name(Y-Z)													
No Flag or Follow Up or Improve Accuracy	Your Rule Name	Specific Data Type	My Organization or Specific Source objects	Outside My Org or Specific Destination objects	Any or E-mail or FTP or HTTP	Shows: none or The number of exceptions added for this rule (double-click this cell)	Detect or Inform User or Ask User or Prevent or Watermark	Email or Log or Alert and how to store an incident	Low or Medium or High or Critical	DLP Blades	Any	None or Specific Category	Your Comment

Geo Policy

Description

For more information, see the *R82 Security Management Administration Guide*.

Creates a policy for traffic to or from specific geographical or political locations.

How to get there:

1. Connect with SmartConsole to the Management Server.
2. From the left navigation panel, click **Security Policies**.
3. In the **Access Control** section, click **Policy**.
4. Follow sk126172 to use **Updatable Objects** in the **Source** and **Destination** columns.

For additional information, see the SmartConsole Online Help (press F1).

Important - From R81, Security Gateways **no** longer support Geo Policy configured in SmartConsole > **Security Policies** view > **Shared Policies** section > **Geo Policy** (Known Limitation PMTR-56212).

Rule structure:

Country	Direction	Action	Track	Comments

Specific Country object	`From and To Country`
	or
	`From Country`
	or
	`To Country`
		`Accept`
		or
		`Drop`
			`None`
			or
			`Log`
			or
			`Alert`
				Your Comment

Mobile Access Policy

Description

For more information, see the *R82 Mobile Access Administration Guide*.

Controls which user groups have access to which applications, when connecting through a Mobile Access Security Gateway.

How to get there:

1. Connect with SmartConsole to the Management Server.
2. From the left navigation panel, click **Security Policies**.
3. In the **Shared Policies** section > in the **Mobile Access** section, click **Policy**.

   This section appears of there is at least one Security Gateway or Cluster object with the Mobile Access Software Blade enabled.

Rule structure:

No	Name	Users	Applications	Install On	Comment
#	Name of Rule	`All Users` or Specific User objects	`Any` or Specific Custom Application objects	`Any` or Specific Security Gateway objects	Your Comment

Firewall Software Blade

This is the main Software Blade that enforces the Access Control and NAT policies on Security Gateways / Cluster Members / Scalable Platform Security Groups.

IPsec VPN Software Blade

This Software Blade encrypts and decrypts traffic between Security Gateways / Cluster Members / Scalable Platform Security Groups and other Security Gateways and clients.

For more information, see:

- *R82 Site to Site VPN Administration Guide*
- sk104760 - ATRG: VPN Core (requires **Advanced** access to *Check Point Support Center*)
- sk108600 - VPN Site-to-Site with 3rd party (requires **Advanced** access to *Check Point Support Center*)

Policy Server Software Blade

This Software Blade enforces a **Desktop Security** Policy on Remote Access Clients.

This policy controls how the Firewall Software Blade on Remote Access Clients inspects the traffic.

For more information, see:

- *"Security Policy" on page 27* > Section *Access Control Policy* > Section *Desktop Rule Base*
- *R82 Remote Access VPN Administration Guide*

Remote Access VPN

If employees remotely access sensitive information from different locations and devices, system administrators must make sure that this access does not become a security vulnerability.

- Check Point's Remote Access VPN solutions let you create a VPN tunnel between a remote user and the internal network.

  For more information, see the *R82 Remote Access VPN Administration Guide*.

- The Mobile Access Software Blade extends the functionality of Remote Access solutions to include many clients and deployments.

  For more information, see the *R82 Mobile Access Administration Guide*.

Threat Prevention

To challenge today's malware landscape, Check Point's comprehensive Threat Prevention solution offers a multi-layered, pre- and post-infection defense approach and a consolidated platform that enables enterprise security to detect and block modern malware.

For more information, see the *R82 Threat Prevention Administration Guide*.

These Software Blades provide Threat Prevention:

- *"Anti-Bot Software Blade" on page 42*
- *"Anti-Virus Software Blade" on page 43*
- *"Threat Extraction Software Blade" on page 44*
- *"Threat Emulation Software Blade" on page 45*
- *"IPS Software Blade" on page 47*

Anti-Bot Software Blade

This Software Blade discovers infections by correlating multiple detection methods:

- Performs post-infection detection of bots on hosts.
- Prevents bot damages by blocking bot C&C (Command and Control) communications.
- Is continuously updated from ThreatCloud, a collaborative network to fight cybercrime.

For more information, see:

- *R82 Threat Prevention Administration Guide*
- sk92264 - ATRG: Anti-Bot and Anti-Virus (requires **Advanced** access to *Check Point Support Center*)

In addition, see *"UserCheck" on page 57*.

Anti-Virus Software Blade

This Software Blade:

- Correlates information from multiple detection engines to detect and block malware at the Security Gateways / Cluster Members / Scalable Platform Security Groups.
- Is continuously updated from ThreatCloud.

For more information, see:

- *R82 Threat Prevention Administration Guide*
- sk92264 - ATRG: Anti-Bot and Anti-Virus (requires **Advanced** access to *Check Point Support Center*)

In addition, see *"UserCheck" on page 57*.

Threat Extraction Software Blade

Part of the SandBlast suite.

This Software Blade:

- Provides protection against incoming malicious content.
- Removes exploitable content, including active content and embedded objects, reconstructs files to eliminate potential threats, and promptly delivers sanitized content to users to maintain business flow.

  To remove possible threats, creates a safe copy of the file, while the inspects the original file for potential threats.

For more information, see:

- *R82 Threat Prevention Administration Guide*
- sk114807 - ATRG: Threat Extraction

In addition, see *"UserCheck" on page 57*.

Threat Emulation Software Blade

Part of the SandBlast suite.

This Software Blade quickly inspects files and runs them in a virtual sandbox to discover malicious behavior.

Discovered malware is prevented from entering the network.

The emulation service reports and automatically shares the newly identified threat information with other customers.

For more information, see:

- *R82 Threat Prevention Administration Guide*
- sk114806 - ATRG: Threat Emulation (requires **Advanced** access to *Check Point Support Center*)

In addition, see *"UserCheck" on page 57*.

Mail Transfer Agent (MTA)

The Threat Emulation Software Blade requires the MTA feature to inspect SMTP traffic.

For more information, see:

- *R82 Threat Prevention Administration Guide*
- sk109699 - ATRG: Mail Transfer Agent (MTA) (requires **Advanced** access to *Check Point Support Center*)

IPS Software Blade

This Software Blade:

- Delivers complete and proactive intrusion prevention.
- Delivers thousands of signatures, behavioral and preemptive protections.
- Gives another layer of security on top of Check Point Firewall technology.
- Protects both clients and servers, and lets you control the network usage of certain applications.

The hybrid detection engine provides:

- Multiple defense layers, which provides excellent detection and prevention capabilities of known threats, and in many cases future attacks as well
- Unparalleled deployment and configuration flexibility and excellent performance.

For more information, see:

- *R82 Threat Prevention Administration Guide*
- sk95193 - ATRG: IPS (requires **Advanced** access to *Check Point Support Center*)

Zero Phishing Software Blade

Zero Phishing is a new technology and a Threat Prevention protection introduced in R81.20.

Zero Phishing prevents unknown zero-day and known phishing attacks on websites in real-time, by utilizing industry leading Machine-Learning algorithms and patented inspection technologies.

Phishing attacks continue to play a dominant role in the digital threat landscape, which is becoming more mature and sophisticated. Most cyber-attacks start with a phishing attempt.

The Check Point Zero Phishing protection scans the web traffic on the Security Gateway and sends it to the Check Point Cloud for scanning. This way, the Zero Phishing protection prevents access to the most sophisticated phishing websites, both known and completely unknown (zero-day phishing websites).

Because the protection is initiated on the network Security Gateway, the protection is browser-agnostic and platform-agnostic and it does not depend on an email security solution.

Protections usually provided by endpoint or email solutions are now available through the Security Gateway, with no need to install and maintain clients on any device.

When you enable Zero Phishing, you must set a Fully Qualified Domain Name (FQDN). The FQDN is resolved to the IP address of the Security Gateway, establishing a channel for script-to-gateway interaction. When activating Zero Phishing, a specialized script is seamlessly integrated into client traffic streams. This script plays a pivotal role in the protection from malicious phishing pages. To facilitate effective communication between the integrated script and the Security Gateway, a deliberate configuration process is necessary

The Zero Phishing protection uses two main engines:

1. **Real-time phishing prevention based on URLs**

   The engine prevents both known and unknown zero-day phishing attacks, by analyzing various features on the URL in real-time. The engine sends the URL information to the URL-reputation cloud service to perform the analysis. For example: brand similarity, non-ASCII characters and time of registration.

   Using Machine-Learning, the risk is calculated and URLs are classified as phishing and blocked.

2. **In-browser Zero Phishing**

   The Security Gateway performs patented Java Script injection to scan HTML forms when they are loaded on the browser (including dynamic forms).

   When the end-user clicks the input fields in the form, all HTML components are scanned in real-time, and the information is sent to the Check Point Zero Phishing cloud service

for AI-based analysis.

The risk is calculated and the phishing site is blocked accordingly.

Notes:

- If both Harmony Browse and Zero Phishing protections are active for the same user, the Harmony Browse protection takes precedence over the Zero Phishing protection.
- Zero Phishing is supported on VSX, ClusterXL in High Availability and Load Sharing modes.
- Site scanning in Internet Explorer is not supported.
- JavaScript injection for HTTP 2.0 connections is not supported.
- In-browser Zero Phishing for mirrored traffic is not supported.
- When the Security Gateway is configured as the HTTP/HTTPS Proxy in the "Non Transparent" mode, internal users must have a direct access to the UserCheck Portal on the Security Gateway. In their web-browsers, internal users must add the FQDN of the Zero Phishing Portal to the Proxy Bypass List.

For more information, see the *R82 Threat Prevention Administration Guide*.

Identity Awareness Software Blade

In traditional firewall setups, traffic is monitored solely through IP addresses. This method does not reveal the user or machine behind those addresses. Identity Awareness closes this gap by mapping user and computer identities to IP addresses. This approach enables more granular Access Control policies and improves data auditing.

Identity Awareness is a versatile and scalable solution, suitable for both Active Directory and non-Active Directory environments, and encompasses employees and guest users alike. It leverages `Source` and `Destination` IP addresses to identify users and computers, which can be uses as matching criteria in Access Control policy rules.

Use Case: Consider a scenario where a company wants to restrict access to sensitive data based on user roles. With Identity Awareness, the administrator can create rules that allow only specific user groups to access certain resources, regardless of the devices they use. For instance, only employees from the "Finance" group can access financial reports, whether they work from the office or remotely.

You can incorporate the following criteria into your Access Control policies:

- User or User Group Identity
- Computer or Computer Group Identity

With Identity Awareness, you define policy rules for specified users, who send traffic from specified computers or from any computer. Likewise, you can create policy rules for any user on specified computers.

Identity Awareness gets identities from the configured identity sources.

For more information, see:

- *R82 Identity Awareness Administration Guide*
- sk86441 - ATRG: Identity Awareness

Content Awareness Software Blade

This Software Blade provides data visibility and enforcement in unified Access Control Policy.

You can set the direction of the data in the Access Control Policy to one of these:

- **Download Traffic** - Into the organization
- **Upload Traffic** - Out of the organization
- **Any Direction**

You can set Data Types in the Access Control Policy to one of these:

- **Content Types** - Classified by analyzing the file content (for example: PCI - credit card numbers, International Bank Account Numbers - IBAN)
- **File Types** - Classified by analyzing the file ID (for example: Viewer File - PDF, Executable file, Presentation file)

You can select one of these services:

- `CheckPointExchangeAgent`
- `ftp`
- `http`
- `https`
- `HTTP_proxy`
- `HTTPS_proxy`
- `smtp`
- `Squid_NTLM`

For more information, see the:

- *R82 Security Management Administration Guide*
- SmartConsole Online Help (press F1)
- sk119715 - ATRG: Content Awareness (CTNT) (requires **Advanced** access to *Check Point Support Center*)

Note - Content Awareness and Data Loss Prevention (see *"Data Loss Prevention Software Blade" on page 55*) use Data Types in the Access Control Policy. However, they have different features and capabilities. They work independently, and the Security Gateway / ClusterXL / Scalable Platform Security Group enforces them separately.

Mobile Access Software Blade

Check Point Mobile Remote Access VPN Software Blade is the safe and easy solution to connect to corporate applications over the internet with your mobile device or PC. The solution provides enterprise-grade remote access with both Layer 3 VPN and SSL VPN. It gives you simple, safe and secure connectivity to your email, calendar, contacts and corporate applications. At the same time, it protects networks and endpoint computers from threats.

The Mobile Access Portal lets mobile and remote workers connect easily and securely to critical resources over the internet.

Check Point Mobile Apps enables secure encrypted communication from unmanaged smartphones and tablets to your corporate resources.

For more information, see:

- *R82 Mobile Access Administration Guide*
- sk104577 - ATRG: Mobile Access Blade

Application Control Software Blade

This Software Blade detects or blocks traffic for applications:

- **Granular Application Control**

  Identifies, allows, or blocks thousands of applications.

  This provides protection against the increasing threat vectors and malware introduced by internet applications.

- **Largest application library with AppWiki**

  Comprehensive application control that uses the industry's largest application library.

  It scans for and detects thousands of applications and Web 2.0 widgets.

  Check Point database is updated frequently with worldwide Apps and Widgets. See *Check Point AppWiki*.

For more information, see:

- *R82 Security Management Administration Guide*
- sk112249 - Best Practices - Application Control
- sk73220 - ATRG: Application Control (requires **Advanced** access to *Check Point Support Center*)

In addition, see *"UserCheck" on page 57*.

URL Filtering Software Blade

This Software Blade lets you control access to web sites and applications based on their categorization.

For more information, see:

- *R82 Security Management Administration Guide*
- sk92743 - ATRG: URL Filtering (requires **Advanced** access to *Check Point Support Center*)

In addition, see *"UserCheck" on page 57*.

Data Loss Prevention Software Blade

This Software Blade prevents unintentional data leaks by catching protected data before it leaves your organization.

This Software Blade identifies, monitors, and protects data transfer through deep content inspection and analysis of transaction parameters (such as source, destination, data object, and protocol), with a centralized management framework. In short, DLP detects and prevents the unauthorized transmission of confidential information.

Note - Data Loss Prevention is also known as Data Leak Prevention, Information Leak Detection and Prevention, Information Leak Prevention, Content Monitoring and Filtering, and Extrusion Prevention.

For more information, see the:

- *R82 Data Loss Prevention Administration Guide*
- SmartConsole Online Help.
- sk73660 - ATRG: Data Loss Prevention (DLP) (requires **Advanced** access to *Check Point Support Center*)

Note - Data Loss Prevention and Content Awareness (see *"Content Awareness Software Blade" on page 51*) both use Data Types in the Access Control Policy. However, they have different features and capabilities. They work independently, and the Security Gateway enforces them separately.

In addition, see *"UserCheck" on page 57*.

Anti-Spam & Email Security Software Blade

This Software Blade enforces Anti-Spam:

- **Based on content fingerprint** - Identifies spam by analyzing known and emerging distribution patterns. By avoiding a search for keywords and phrases that might classify a legitimate email as spam and instead focusing on other message characteristics, this solution offers a high spam detection rate with a low number of false positives.
- **Based on IP Reputation** - Blocks known spammers.
- **Based on user defined IP addresses and Sender / Domains** - Blocks senders identified by either name, domain, or IP address.

You can configure:

- Directional scanning for SMTP traffic
- Directional scanning for POP3 traffic
- Network exceptions
- List of allowed email senders

For more information, see:

- *R82 Threat Prevention Administration Guide*
- SmartDashboard built-in help

UserCheck

When you enable the UserCheck feature, the Security Gateway sends messages to users about possible non-compliant behavior or dangerous Internet browsing, based on the rules an administrator configured in the Security Policy. This helps users to prevent security incidents and to learn about the organizational security policy.

You can:

- Redirect the users to the UserCheck Web Portal on the Security Gateway.

  The users see the applicable message and perform the required action in UserCheck Web Portal that opens in a new web browser tab or window.

- Install the UserCheck Client on endpoint computers.

  The users see the applicable message and perform the required action on their computers.

  See *"UserCheck Client" on page 59*.

These Software Blades support the UserCheck feature:

- *"Data Loss Prevention Software Blade" on page 55*
- Access Control:
  - *"Application Control Software Blade" on page 53*
  - *"URL Filtering Software Blade" on page 54*
  - *"Content Awareness Software Blade" on page 51*
- Threat Prevention:
  - *"Anti-Bot Software Blade" on page 42*
  - *"Anti-Virus Software Blade" on page 43*
  - *"Threat Emulation Software Blade" on page 45*
  - *"Threat Extraction Software Blade" on page 44*
  - *"Zero Phishing Software Blade" on page 48*

For more information, see:

- The *R82 Data Loss Prevention Administration Guide*
- The *R82 Security Management Administration Guide* > Chapter *Creating an Access Control Policy* > Section *The Columns of the Access Control Rule Base*

- The *R82 Threat Prevention Administration Guide*
- sk83700 - How to customize and localize the UserCheck Portal

UserCheck Client

The UserCheck Client is installed on endpoint computers to communicate with the Security Gateway and show notifications to users.

UserCheck Client sends notifications for applications that are not in a web browser, such as Skype, iTunes, or browser add-ons (such as radio toolbars). The UserCheck Client can also work together with the UserCheck Portal to show notifications on the computer itself in these cases:

- It is not possible to show the notification in a web browser.
- The UserCheck engine determines that the notification does not appear correctly in the web browser.

Notifications of incidents are shown in a pop up from the UserCheck Client in the system tray.

Users select an option in the notification message to respond in real-time.

For Data Loss Prevention (DLP), administrators with full permissions or the **View/Release/Discard DLP messages** permission can also send or discard incidents from the SmartConsole **Logs & Monitor** view > **Logs** tab.

UserCheck Client Requirements

See the *R82 Release Notes* > *UserCheck Client Requirements*.

Workflow for installing and configuring UserCheck Clients:

1. Open the Security Gateway object.
2. Enable UserCheck and the UserCheck Client in the Security Gateway object.

   See *"Enabling UserCheck Client" on page 61*.
3. Configure how the UserCheck Clients communicate with the Security Gateway and create trust with it.

   See *"Client and Gateway Communication" on page 62*.
4. Install the UserCheck Client on the endpoint computers.

   See *"Installing UserCheck Client" on page 69*.
5. Connect the UserCheck Client to the Security Gateway.

   See *"Connecting UserCheck Client to the Security Gateway" on page 74*.
6. Make sure the UserCheck Clients can receive notifications.

Perform a simplest action on the endpoint computers that violates the configured Security Policy.

Enabling UserCheck Client

Enable UserCheck and the UserCheck Client on the Security Gateway in the Properties window of the Security Gateway object in SmartConsole. This is necessary to let clients communicate with the Security Gateway.

To enable UserCheck and the UserCheck Client on the Security Gateway:

1. In SmartConsole, click **Gateways & Servers** and double-click the Security Gateway.

   The **Security Gateway Properties** window opens and shows the **General Properties** page.

2. From the navigation tree, click **UserCheck**.
3. Select **Enable UserCheck for active blades**.

   This enables UserCheck notifications from the Security Gateway.

4. In the UserCheck Client section, select **Activate UserCheck Client support**.

   This enables UserCheck notifications from the client.

5. Click **OK**.
6. Install the Access Control Policy.

Client and Gateway Communication

In an environment with UserCheck Clients, the Security Gateway acts as a server for the clients. Each client must be able to *discover* the server and create *trust* with it.

To create trust, the client makes sure that the server is the correct one. It compares the server fingerprint calculated during the SSL handshake with the expected fingerprint. If the server does not have the expected fingerprint, the client asks the user to manually confirm that the server is correct.

Here is a list of the methods that you can use for clients to discover and trust the server.

Option Comparison

Configuration	Must Have AD	Manual User Trust (one time) Necessary?	Multi-Site	Client Stays Signed?	Still works after Gateway Changes	Level	Recommended for...
File name based	No	Yes	No	Yes	No	Very Simple	Single Security Gateway configurations
AD based	Yes	No	Yes	Yes	Yes	Simple	Configurations with AD that you can modify
DNS based	No	Yes	Partially (per DNS server)	Yes	Yes	Simple	Configurations without AD With an AD you cannot change, and a DNS that you can change

Configuration	Must Have AD	Manual User Trust (one time) Necessary?	Multi-Site	Client Stays Signed?	Still works after Gateway Changes	Level	Recommended for...
Remote registry	No	No	Yes	Yes	Yes	Moderate	Where remote registry is used for other purposes

1. **File name based server configuration**

   If no other method is configured (default, out-of-the-box situation), all UserCheck Clients downloaded from the portal are renamed to have the portal machine IP address in the filename. During installation, the client uses this IP address to connect to the Security Gateway. Note that the user has to click **Trust** to manually trust the server.

   Explanation

   This option is the easiest to configure, and works out-of-the-box. It tells users to manually click **Trust** to trust the server the first time they connect. You can use this option if your configuration has only one Security Gateway with the relevant Software Blades.

   How does it work?

   When a user downloads the UserCheck Client, the address of the Security Gateway is inserted in the filename. During installation, the client finds if there is a different discovery method configured (AD based, DNS based, or local registry). If no method is configured, and the Security Gateway can be reached, it is used as the server. In the UserCheck Settings window, you can see that the server you connect to is the same as the Security Gateway in the UserCheck Client filename.

   Users must manually make sure that the trust data is valid, because the filename can be easily changed.

   Renaming the MSI

   You can manually change the name of the MSI file before it is installed on a computer.

   This connects the UserCheck Client to a different Security Gateway.

a. Make sure the Security Gateway has a DNS name.

b. Rename the MSI using this format:

UserCheck_~*GWname*.msi

Where *GWname* - is the DNS name of the Security Gateway.

Optional format:

UserCheck_~*GWname-port*.msi

Where *port* is the port number of notifications.

For example:

```
UserCheck_~mygw-18300.msi
```

Notes:

- The prefix does not have to be "UserCheck". The important part of the format is underscore tilde (_~), which indicates that the next string is the DNS of the Security Gateway.
- If you want to add the port number for the notifications to the client from the Security Gateway, the hyphen (-) indicates that the next string is the port number.

2. **Active Directory Based Configuration**

If client computers are members of an Active Directory domain, you can configure the server addresses and trust data using a dedicated tool.

Explanation

If your client computers are members of an Active Directory domain and you have administrative access to this domain, you can use the Distributed Configuration tool to configure connectivity and trust rules.

The Distributed Configuration tool has three windows:

- **Welcome** - Describes the tool and lets you enter different credentials that are used to access the AD.
- **Server configuration** - Configure which Security Gateway the client connects to, based on its location.
- **Trusted Security Gateways** - View and change the list of fingerprints that the Security Gateways consider secure.

To enable Active Directory based configuration for clients:

a. Download and install the UserCheck Client MSI on a computer.

   From the command line on that computer, run the client configuration tool with the AD utility.

   For example, on a Windows 7 computer:

   ```
   "C:\Users\%USERNAME%\Local Settings\Application
   Data\Checkpoint\UserCheck\UserCheck.exe" -adtool
   ```

   The **Check Point UserCheck - Distributed Configuration** tool opens.

b. In the **Welcome** page, enter the credentials of an AD administrator.

   By default, your AD username is shown. If you do not have administrator permissions, click **Change user** and enter administrator credentials.

c. In the **Server Configuration** page, click **Add**.

   The **Identity Server Configuration** window opens.

d. Select **Default** and then click **Add**.

e. Enter the IP address or Fully Qualified Domain Name (FQDN) and the port of the Security Gateway.

f. Click **OK**.

   The identity of the AD Server for the UserCheck Client is written in the Active Directory and given to all clients.

Note - The entire configuration is written under a hive named **Check Point** under the **Program Data** branch in the AD database that is added in the first run of the tool. Adding this hive does not affect other AD based applications or features.

Server Configuration Rules

If you use the Distributed Configuration tool and you configure the client to **Automatically discover** the server, the client fetches the rule lists. Each time it must connect to a server, it tries to match itself against a rule, from top to bottom.

When the tool matches a rule, it uses the servers shown in the rule, according to the priority specified.

The configuration in this example means:

a. If the user is coming from `'192.168.0.1 - 192.168.0.255'`, then try to connect to `US-GW1`.

   If it is not available, try `BAK-GS2` (it is only used if `US-GW1` is not available, as its priority is higher).

b. If the user is connected from the Active Directory site `'UK-SITE'`, connect either to `UK-GW1` or `UK-GW2` (select between them randomly, as they both have the same priority). If both of them are not available, connect to `BAK-GS2`.

c. If rules 1 and 2 do not apply, connect to `BAK-GS2` (the default rule is always matched when it is encountered).

Use the **Add**, **Edit** and **Remove** buttons to change the server connectivity rules.

Trusted Gateways

The **Trusted Gateways** window shows the list of servers that are trusted - no messages open when users connect to them.

You can add, edit or delete a server. If you have connectivity to the server, you can get the name and fingerprint. Enter its IP address and click **Fetch Fingerprint** in the **Server Trust Configuration** window. If you do not have connectivity to the server, enter the same name and fingerprint that is shown when you connect to that server.

3. **DNS SRV Record Based Server Discovery**

Configure the server addresses in the DNS server. Note that the user has to click **Trust** to manually trust the server.

Explanation

If you configure the client to **Automatic Discovery** (the default), it looks for a server by issuing a DNS SRV query for the address of the Security Gateway (the DNS suffix is added automatically). You can configure the address in your DNS server.

To configure DNS based configuration on the DNS server:

a. Go to **Start** > **All Programs** > **Administrative Tools** > **DNS**.

b. Go to **Forward lookup zones** and select the applicable domain.

c. Go to the **_tcp** subdomain.

d. Right-click and select **Other new record**.

e. Select **Service Location**, **Create Record**.

f. In the **Service** field, enter **CHECKPOINT_DLP**.

g. Set the **Port number** to 443.

h. In **Host offering this server**, enter the IP address of the Security Gateway.

i. Click **OK**.

To configure Load Sharing for the Security Gateway, create multiple SRV records with the same priority.

To configure High Availability, create multiple SRV records with different priorities.

Note - If you configure AD based and DNS based configuration, the results are combined according to the specified priority (from the lowest to highest).

Troubleshooting DNS Based Configuration

To troubleshoot issues in DNS based configuration, you can see the SRV records that are stored on the DNS server.

To see SRV records on the DNS server:

Run:

```
C:\> nslookup
 > set type=srv
 > checkpoint_dlp._tcp
```

Example result:

```
C:\> nslookup
 > set type=srv
 > checkpoint_dlp._tcp
Server: dns.company.com
Address: 192.168.0.17
checkpoint_dlp._tcp.ad.company.com SRV service location:
          priority = 0
          weight = 0
          port = 443
          svr hostname = dlpserver.company.com
dlpserver.company.com internet address = 192.168.1.212
>
```

Remote Registry

All of the client configuration, including the server addresses and trust data reside in the registry. You can configure the values before installing the client (by GPO, or any other system that lets you control the registry remotely). This lets you use the configuration when the client is first installed.

Explanation

If you have a way to configure registry entries to your client computers, for example, Active Directory or GPO updates, you can configure the Security Gateway addresses and trust parameters before you install the clients. Clients can then use the configured settings immediately after installation.

To configure the remote registry option:

1. Install the client on one of your computers. The agent installs itself in the user directory, and saves its configuration to `HKEY_CURRENT_USER`.
2. Connect manually to all of the servers that are configured, verify their fingerprints, and click **Trust** on the fingerprint verification dialog box.
3. Configure the client to manually connect to the requested servers (use the **Settings** window).
4. Export these registry keys:
    a. The entire tree:

    ```
    HKEY_CURRENT_USER\SOFTWARE\CheckPoint\UserCheck\Trusted Gateways
    ```

    b. The branch:

    ```
    HKEY_CURRENT_USER\SOFTWARE\CheckPoint\UserCheck\
    ```

        i. The key:

        ```
        Default Gateway
        ```

        ii. The key:

        ```
        DefaultGatewayEnabled
        ```

5. Import the exported keys to the endpoint computers before you install the UserCheck Client.

Installing UserCheck Client

After configuring the clients to connect to the Security Gateway, install the clients on the user machines.

1. Get the UserCheck Client MSI file from the Security Gateway in **one** of these ways:

   Download the UserCheck Client from the Security Gateway using an SCP client

   Important - The SCP user must have the default shell `/bin/bash` in Gaia OS on the Security Gateway.

   a. Go to this directory:

   ```
   /opt/CPUserCheckPortal/htdocs/UserCheck/client/
   ```

   b. Download this file:

   ```
   Check_Point_UserCheck.msi
   ```

   Download the UserCheck Client from the Security Gateway object in SmartConsole

   Important - Before you can use this link, you must install an Access Control policy at least one time so that the UserCheck Portal starts.

   a. From the left navigation panel, click **Gateways & Servers**.

   b. Double-click the Security Gateway object.

   c. From the left tree, click **General Properties**.

d. Enable at least one of these Software Blades:
   - Data Loss Prevention
   - Access Control:
     - Application Control
     - URL Filtering
     - Content Awareness
   - Threat Prevention:
     - Anti-Bot
     - Anti-Virus
     - Threat Emulation
     - Threat Extraction
     - Zero Phishing

e. From the left tree, click **UserCheck**.

f. In the section **UserCheck Client**, click the link **Download Client**.

g. The download opens in your default web browser.

2. Install the UserCheck Client on the user endpoint computers.

   You can use any method of MSI mass configuration and installation that you select.

   For example, you can send users an email with a link to install the client. When a user clicks the link, the MSI file automatically installs the client on the computer.

   Notes:
   - The installation is silent.
     Reboot is not necessary.
   - To install the UserCheck Client for all user accounts on a Windows computer, see sk96107.
   - To uninstall the UserCheck Client from a Windows computer, see *"Uninstalling UserCheck Client" on page 71*.

Uninstalling UserCheck Client

Default Uninstall Procedure

1. Go to the **Start** menu > **Check Point** > **UserCheck**.
2. Click the "**Uninstall**" shortcut.
3. Follow the instructions on the screen.
4. Restart the endpoint computer.

Manual Uninstall Procedure

If there is no "**Uninstall**" shortcut in the **Start** menu, follow **one** of these procedures:

Uninstall the UserCheck Client manually using Windows Installer

1. Make sure the **UserCheck.exe** application is not running.

   Use Windows Task Manager, or any similar 3rd-party tool.

   If it is currently running, end / kill it.
2. Get the UserCheck Client GUID from the Windows Registry Editor:
   a. Open the Windows Registry Editor (**regedit**):
      i. Click the **Start** menu.
      ii. Enter **regedit**.
      iii. Click **Registry Editor**.

      Alternatively, press the **Windows + R** keys > type **regedit** > click OK / press the Enter key.
   b. Navigate to:

      ```
      Computer\HKEY_CURRENT_
      USER\Software\CheckPoint\UserCheck\1.0
      ```
   c. Right-click the key **PRODUCT_GUID** > click **Modify**.
   d. Copy the entire string **{<GUID>}** and paste it in a plain-text editor.
   e. Click **Cancel** in the Windows Registry Editor.
   f. Close the Windows Registry Editor.
3. In the plain-text editor, prepare the required syntax:

```
%SystemRoot%\SysWOW64\msiexec.exe /x {<GUID you copied from Windows Registry Editor>}
```

Dummy example:

```
C:\Windows\SysWOW64\msiexec.exe /x {AAD3D77A-7476-469F-ADF4-04424124E91D}
```

Reference:

https://learn.microsoft.com/en-us/windows-server/administration/windows-commands/msiexec

4. Open Windows Command Prompt:
   a. Click the **Start** menu.
   b. Enter **cmd**.
   c. Click **Command Prompt**.

   Alternatively, press the **Windows + R** keys > type **cmd** > click OK / press the Enter key.
5. Paste the required syntax from the plain-text editor and press the Enter key.
6. Restart the endpoint computer.

Delete the UserCheck client manually from the endpoint computer

1. Make sure the **UserCheck.exe** application is not running.

   Use Windows Task Manager, or any similar 3rd-party tool.

   If it is currently running, end / kill it.
2. Delete the **UserCheck** folder:

   Important - You must delete this folder for each user on the computer.

   a. In Windows File Manager (or any file manager), go to:

   ```
   C:\Users\%USERNAME%\AppData\Local\CheckPoint\
   ```

   b. Delete this folder:

   ```
   UserCheck
   ```
3. Delete the **UserCheck** branch in the Windows Registry:

a. Open the Windows Registry Editor (**regedit**):

   i. Click the **Start** menu.

   ii. Enter **regedit**.

   iii. Click **Registry Editor**.

   Alternatively, press the **Windows + R** keys > type **regedit** > click OK / press the Enter key.

b. Navigate to:

```
Computer\HKEY_CURRENT_
USER\Software\CheckPoint\UserCheck
```

c. Back up the Windows Registry.

   Refer to the Microsoft article "Windows registry information for advanced users".

d. Right-click the **UserCheck** branch > click **Delete** > confirm.

e. Close the Windows Registry Editor.

4. Restart the endpoint computer.

Connecting UserCheck Client to the Security Gateway

If UserCheck is enabled on the Security Gateway, users must enter their username and password after the client installs.

When the UserCheck Client is first installed, the UserCheck Client tray icon indicates that it is not connected.

When the UserCheck Client connects to the Security Gateway, the UserCheck Client tray icon shows that the client is active.

The first time that the UserCheck Client connects to the Security Gateway, it asks user to approve of the Security Gateway fingerprint.

Example:

Best Practices:

- Let the users know this happens.
- Use a certificate that is trusted by the certificate authority installed on users' computers.
  Then users do **not** see a message "`Issued by unknown certificate authority`".

Note - If the UserCheck Client is not connected to the Security Gateway, the behavior is as if the client was never installed.

UserCheck and Check Point Password Authentication

To enable Check Point password authentication:

1. SmartConsole Configuration:
    a. From the top, click **Objects** > **Object Explorer**.
    b. In the left pane, select only **Users/Identities**.
    c. Configure the required settings:

    If the required User object already exists

        i. Double-click the applicable **User** object.
        ii. From the left, click **General**.
        iii. In the **General properties** section, make sure to configure a valid email address.
        iv. Click **OK**.

    If the required User object does not exist yet

        i. Make sure the applicable **User Template** object exists.

        If it does not, from the top toolbar, click **New** > **Users/Identity** > **User Template** > configure the required settings > click **OK**.

        ii. From the top toolbar, click **New** > **Users/Identity** > **User**.
        iii. Select the required **User Template** and click **OK**.
        iv. Configure the required settings:

            - At the top, configure the object name
            - On **General** page, in the **General properties** section, make sure to configure a valid email address.
            - On **Authentication** page, in the **Authentication Method** section, select **Check Point Password** > click **Set new password** > enter the password > click **OK**.

        v. Click **OK**.

    d. Close the **Object Explorer** window.
2. UserCheck Client Configuration:

a. On the endpoint computer, right-click the UserCheck Client icon in the Notification Area (next to the system clock).

b. Click **Settings**.

c. Click **Advanced**.

d. Select **Authentication with Check Point user accounts defined internally in SmartConsole**.

Helping Users

If users require assistance to troubleshoot issues with the UserCheck Client, you can ask them to send you the logs.

To configure the UserCheck Client to generate logs:

1. Right-click the UserCheck Client tray icon and select **Settings**.
2. Click **Log to** and browse to a pathname where the logs are saved.
3. Click **OK**.
4. Make sure that the UserCheck Clients can connect to the Security Gateway and receive notifications.

   See *"Connecting UserCheck Client to the Security Gateway" on page 74*.

To send UserCheck Client logs from the endpoint computer:

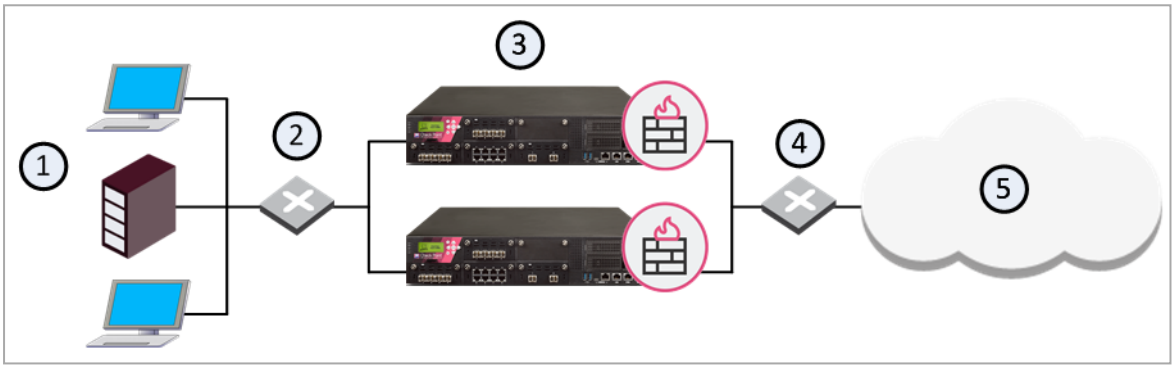
1. Right-click the UserCheck Client tray icon and select **Status**.
2. Click **Advanced**.
3. Click the link **Collect information for technical support**.

   The default email client opens, with an archive of the collected logs attached.

ClusterXL Software Blade

ClusterXL is a Check Point software-based cluster solution for Security Gateway redundancy and Load Sharing. A ClusterXL Security Cluster contains identical Check Point Security Gateways.

- A High Availability Security Cluster ensures Security Gateway and VPN connection redundancy by providing transparent failover to a backup Security Gateway in the event of failure.
- A Load Sharing Security Cluster provides reliability and also increases performance, as all members are active.



Item	Description
1	Internal network
2	Switch for internal network
3	Security Gateways with ClusterXL Software Blade
4	Switch for external networks
5	Internet

For more information, see the *R82 ClusterXL Administration Guide*.

Note - This Software Blade does not apply to Scalable Platforms.

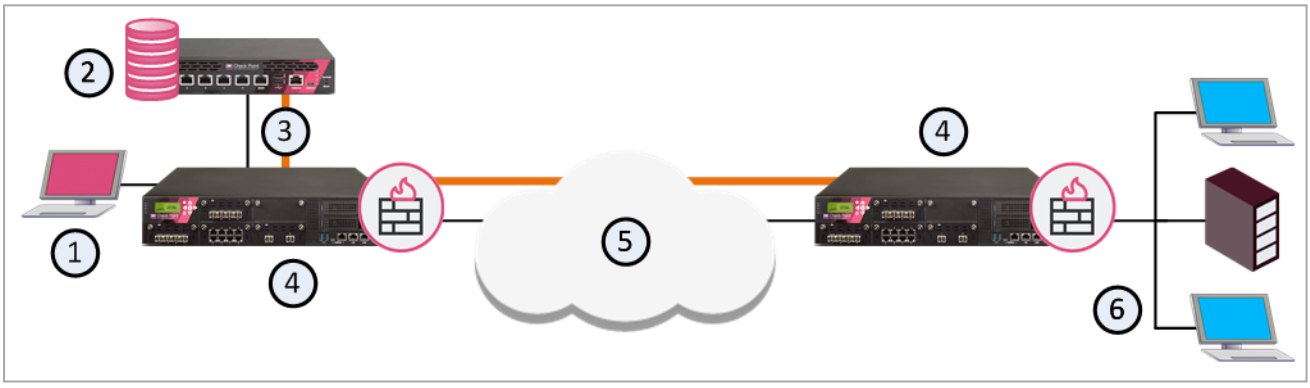
QoS Software Blade

QoS is a policy based bandwidth management solution that lets you:

- Prioritize business-critical traffic, such as ERP, database and Web services traffic, over lower priority traffic.
- Guarantee bandwidth and control latency for streaming applications, such as Voice over IP (VoIP) and video conferencing.
- Give guaranteed or priority access to specified employees, even if they are remotely accessing network resources.

You deploy QoS with the Security Gateway.

QoS is enabled for both encrypted and unencrypted traffic.



Item	Description
1	SmartConsole
2	Security Management Server
3	QoS Policy
4	Security Gateway with QoS Software Blade
5	Internet
6	Internal network

QoS leverages the industry's most advanced traffic inspection and bandwidth control technologies. Check Point patented Stateful Inspection technology captures and dynamically updates detailed state information on all network traffic. This state information is used to classify traffic by service or application. After traffic has been classified, QoS applies an innovative, hierarchical, Weighted Fair Queuing (WFQ) algorithm to accurately control bandwidth allocation.

Note - When the QoS Software Blade is disabled, the Security Gateway does not modify DSCP bits in packets that pass through.

For more information, see the *R82 QoS Administration Guide*.

VSX

The **Virtual System eXtension** product runs several virtual firewalls on the same hardware.

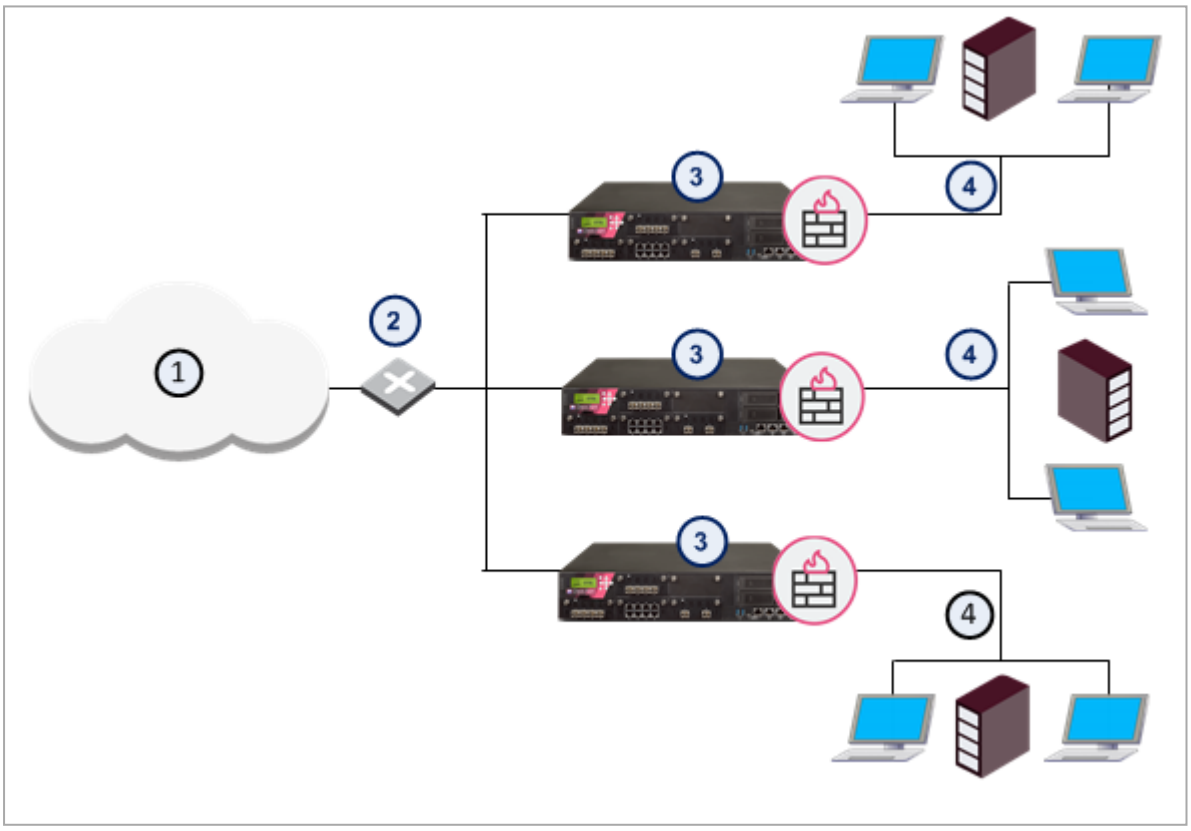
Each **Virtual System** works as a Security Gateway, typically protecting a specified network. When packets arrive at the VSX Gateway, it sends traffic to the Virtual System protecting the destination network. The Virtual System inspects all traffic and allows or rejects it according to rules defined in the security policy.

In order to better understand how virtual networks work, it is important to compare physical network environments with their virtual (VSX) counterparts. While physical networks consist of many hardware components, VSX virtual networks reside on a single configurable VSX Gateway or cluster that defines and protects multiple independent networks, together with their virtual components.

Example Physical Network Topology

In a typical deployment with multiple Security Gateways, each protects a separate network.

Each physical Security Gateway has interfaces to the perimeter router and to the network it protects.

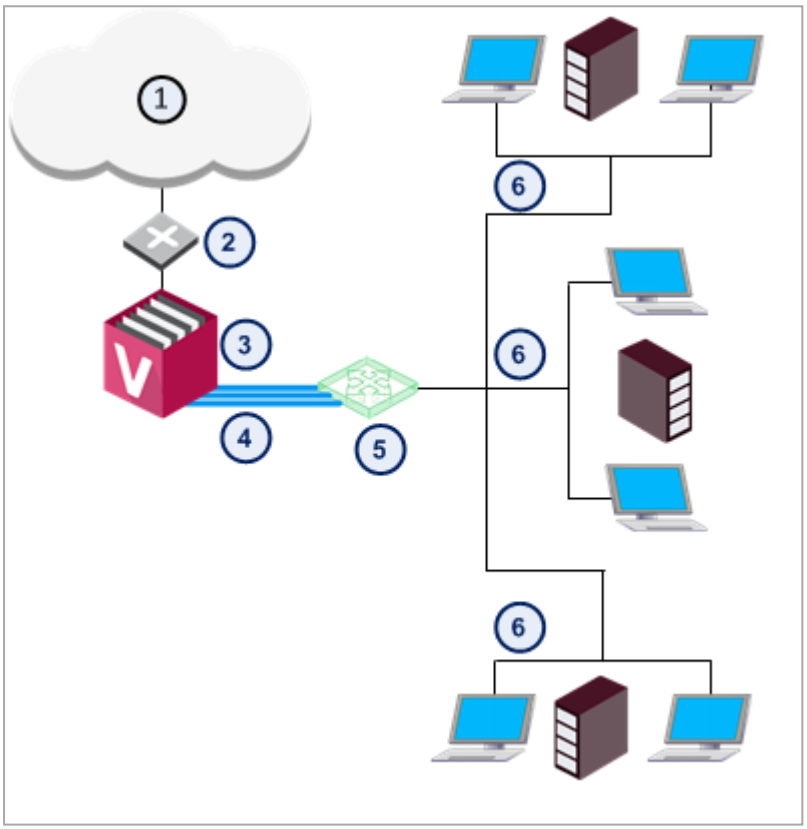


Item	Description
1	Internet

Item	Description
2	Router
3	Security Gateways
4	Network

Example VSX Virtual Network Topology

Deploy one VSX Gateway with four Virtual Systems to protect multiple networks.



Item	Description
1	Internet
2	Router
3	VSX Gateway. Each Virtual System in a VSX environment is a Security Gateway, with the same security and networking functionality as a physical gateway. Each handles packet traffic to and from the one network it protects.
4	Warp Links. Virtual interfaces and network cables connect the Virtual Systems and the Virtual Switch.

Item	Description
5	Virtual Switch. Connects all the Virtual Systems to the Internet router.
6	Networks

For more information, see the *R82 VSX Administration Guide*.

SecureXL

This feature accelerates traffic that passes through a Security Gateway / each Cluster Member / Scalable Platform Security Group.

For more information, see:

- *R82 Performance Tuning Administration Guide* > section "SecureXL"
- sk153832 - ATRG: SecureXL for R80.20 and above (requires **Advanced** access to *Check Point Support Center*)
- sk98348 - Best Practices - Security Gateway Performance

CoreXL

CoreXL is a performance-enhancing technology for Security Gateways on multi-core platforms.

CoreXL makes it possible for the CPU cores to perform multiple tasks concurrently. This enhances the Security Gateway performance.

CoreXL provides almost linear scalability of performance, according to the number of processing cores on a single machine. The increase in performance does not require changes to management or to network topology.

On a Security Gateway / Cluster Members / Scalable Platform Security Group with CoreXL enabled, the Firewall kernel is replicated multiple times.

Each replicated copy of the Firewall kernel, or CoreXL Firewall instance, runs on one CPU core.

These CoreXL Firewall instances handle traffic concurrently, and each CoreXL Firewall instance is a complete and independent Firewall inspection kernel. When CoreXL is enabled, all the Firewall kernel instances in the Security Gateway process traffic through the same interfaces and apply the same security policy.

CoreXL Firewall instances work with SecureXL instances.

For more information. see:

- *R82 Performance Tuning Administration Guide* > section "CoreXL"
- sk98737 - ATRG: CoreXL (requires **Advanced** access to *Check Point Support Center*)
- sk98348 - Best Practices - Security Gateway Performance

Multi-Queue

By default, each network interface has one traffic queue handled by one CPU.

You cannot use more CPU cores for acceleration than the number of interfaces handling traffic.

Multi-Queue configures more than one traffic queue for each network interface.

For each interface, more than one CPU core is used for acceleration.

Note - Multi-Queue is applicable only if SecureXL is enabled (this is the default).

For more information, see:

- *R82 Performance Tuning Administration Guide* > section "Multi-Queue"
- sk98348 - Best Practices - Security Gateway Performance

HyperFlow

Elephant flows are large (in total number of bytes) continuous connections that the TCP or UDP establishes.

For example, a download of a large file (such as a Linux ISO file) over the HTTP, HTTPS, FTP, or NFS protocol.

These large continuous connections consume the network capacity significantly in comparison to other types of data sessions.

Without the HyperFlow feature, a Security Gateway uses only one CPU core (one CoreXL Firewall instance) to inspect one elephant connection. In addition, traffic throughput decreases gradually as the CPU utilization increases on the Security Gateway.

The HyperFlow feature on Security Gateways R81.20 and higher handles such elephant connections on more than one CPU core in parallel.

The HyperFlow feature breaks the whole inspection task into smaller tasks and dispatches these smaller tasks to the available CPU cores:

The tasks without the HyperFlow	The tasks with the HyperFlow
1. Packet retrieval 2. Inbound Streaming 3. Protocol parsers 4. Context Management Interface / Infrastructure (CMI) 5. Pattern Match (PM) and Hash (MD5, SHA) 6. Software Blade logic 7. Outbound Streaming 8. Routing 9. Packet transmission	1. Inbound processing in CoreXL Firewall: a. Packet retrieval b. Inbound Streaming c. Protocol parsers d. Context Management Interface / Infrastructure (CMI) 2. Internal PPE processing (on many CPU cores): a. Pattern Match (PM) and Hash (MD5, SHA) b. Packet transmission 3. Outbound processing in CoreXL Firewall: a. Software Blade logic b. Outbound Streaming c. Routing

As a result, the HyperFlow feature:

- Increases throughput of elephant connections when Threat Prevention Software Blades are enabled (the Security Gateway takes less time to inspect elephant connections).

  This is possible only if the network infrastructure is not a "bottleneck".
- Automatically detects and dynamically allocates the CPU cores between main tasks on a Security Gateway.
- Improves response time from the CoreXL FWK processes while they inspects elephant connections (the idle time of the corresponding CPU cores increases).

Important:

- By default, the HyperFlow feature is enabled on Check Point Appliances that meet the requirements.
- By design, the HyperFlow feature works only in the User Space Firewall (USFW).
- By design, the HyperFlow feature engages only when needed, and when the total CPU load allows it.
  The total throughput has priority over elephant connections.

Notes:

- By design, a manual allocation of CPU cores is not necessary. Therefore, it is not possible.
  You can configure thresholds to control when HyperFlow is active or passive.
- By default, HyperFlow works in the standby mode.
  HyperFlow is triggered (becomes active) when a heavy connection is detected.
  HyperFlow becomes passive when the heavy connection is closed.

For additional information, see:

- sk178070
- *R82 Performance Tuning Administration Guide* > Section *HyperFlow*.

ICAP

The **Internet Content Adaptation Protocol (ICAP)** is a lightweight HTTP-like protocol (request and response protocol), which is used to extend transparent proxy servers. This frees up resources and standardizes the way in which new features are implemented. ICAP is usually used to implement virus scanning and content filters in transparent HTTP proxy caches.

The ICAP allows ICAP Clients to pass HTTP / HTTPS messages to ICAP Servers for content adaptation. The ICAP Server executes its transformation service on these HTTP / HTTPS messages and sends responses to the ICAP Client, usually with modified HTTP / HTTPS messages. The adapted HTTP / HTTPS messages can be HTTP / HTTPS requests, or HTTP / HTTPS responses.

You can configure a Check Point Security Gateway / ClusterXL as:

- ICAP Client - To send the HTTP / HTTPS messages to ICAP Servers for content adaptation.
- ICAP Server - To perform content adaptation in the HTTP / HTTPS messages received from ICAP Clients.
- Both ICAP Client and ICAP Server at the same time.

You can configure a Check Point Scalable Platform Security Group as:

- ICAP Client - To send the HTTP / HTTPS messages to ICAP Servers for content adaptation.

  Note - Scalable Platforms do not support ICAP Server is not supported (Known Limitation MBS-4094).

Check Point Security Gateway / ClusterXL / Scalable Platform Security Group configured for ICAP can work with third party ICAP devices without changing the network topology.

For more information, see the *R82 Threat Prevention Administration Guide*.

HTTPS Inspection

Inspects the HTTPS traffic with these Software Blades:

- Anti-Bot
- Anti-Virus
- Application Control
- Content Awareness (Data Awareness)
- Data Loss Prevention
- IPS
- Threat Emulation
- URL Filtering

Security Gateways cannot inspect HTTPS traffic because it is encrypted. You can enable the HTTPS Inspection feature to let the Security Gateways create new SSL connections with the external site or server. The Security Gateways are then able to decrypt and inspect HTTPS traffic that uses the new SSL connections.

Security Gateways use the Trusted CA package when they connect to HTTPS servers on behalf of internal clients. See sk64521.

For more information, see:

- *R82 Threat Prevention Administration Guide* > Chapter *HTTPS Inspection*.
- sk108202 - Best Practices - HTTPS Inspection
- sk65123 - HTTPS Inspection FAQ

HTTP/HTTPS Proxy

You can configure a Security Gateway / ClusterXL / Scalable Platform Security Group to act as an HTTP/HTTPS Proxy on your network.

In such configuration, the Security Gateway / ClusterXL / Security Group becomes an intermediary between hosts that communicate with each other through the Security Gateway / ClusterXL / Security Group. It does not allow a direct connection between these hosts.

Each successful connection creates two different connections:

- One connection between the client in the organization and the proxy (Security Gateway / ClusterXL / Security Group).
- One connection between the proxy (Security Gateway / ClusterXL / Security Group) and the actual destination.

These proxy modes are supported:

Mode	Description
Transparent	All HTTP traffic on specified ports and interfaces is intercepted and processed by the Proxy code in the Security Gateway / ClusterXL / Security Group. No configuration is required on the clients.
Non Transparent	All HTTP/HTTPS traffic on specified ports and interfaces is intercepted and processed by the Proxy code in the Security Gateway / ClusterXL / Security Group. Configuration of the proxy server and proxy port is required on client machines.

How to get there:

1. Connect with SmartConsole to the Management Server.
2. From the left navigation panel, click **Gateways & Servers**.
3. Double-click the Security Gateway / Cluster object.
4. In the left tree, click the **HTTP/HTTPS Proxy** page.

Important - When you enable the HTTP/HTTPS Proxy, the Security Gateway / Cluster performance can decrease in situations where SecureXL would otherwise accelerate proxied traffic. See sk92482.

For more information, see:

- SmartConsole built-in help (in the Security Gateway / Cluster object, click the (?) button in the top right corner).
- sk110013 - How to configure Check Point Security Gateway as HTTP/HTTPS Proxy (requires **Advanced** access to *Check Point Support Center*)

  This article also describes the Proxy Chaining configuration.

Hardware Security Module (HSM)

In This Section:

Why Use an HSM?

Hardware Security Module (HSM) is a device that stores cryptographic keys.

HSM adds an additional layer of security to the network. HSM is designed to provide dedicated cryptographic functionality.

When Check Point Security Gateway uses an HSM, the HSM holds these objects for Outbound HTTPS Inspection:

1. The Certificate Authority (CA) certificate (the certificate buffer and the key pair).

   The administrator creates the CA certificate and the key pair before you configure the Security Gateway to work with an HSM.

2. Two to three RSA key pairs for fake certificates.

   These keys are created during the initialization of the HTTPS Inspection daemon on the Security Gateway with 1024-bit, 2048-bit, or 4096-bit length.

You can use these HSM solutions to work with the Check Point Security Gateway:

- **Gemalto Luna SP SafeNet HSM**

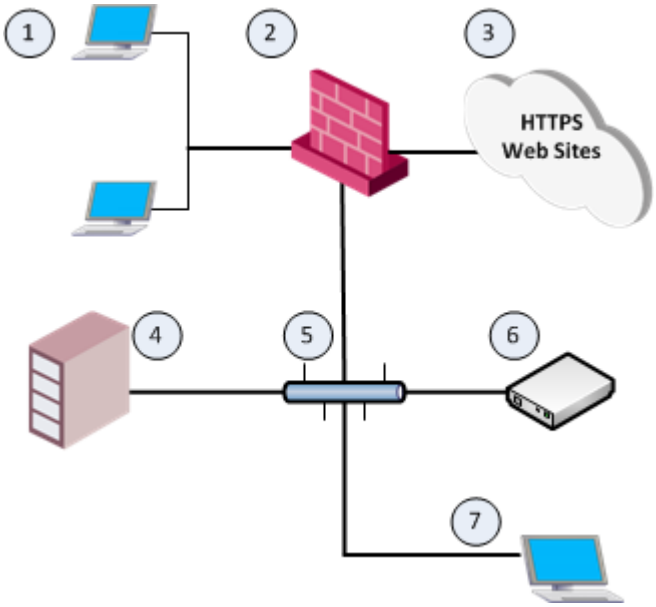
  See *"Working with Gemalto HSM" on page 102*.

- **FutureX**

  See *"Working with FutureX HSM" on page 119*.

Note - For other HSM vendors that use PKCS#11 API, contact Check Point Solution Center through a local Check Point Office.

The Check Point Environment with an HSM



Item	Description
1	Internal computers that connect to HTTPS web sites through the Check Point Security Gateway.
2	Check Point Security Gateway with HTTPS Inspection enabled.
3	HTTPS web sites on the Internet.
4	Check Point Security Management Server that manages the Check Point Security Gateway.
5	Interconnecting Network.
6	HSM Server that stores and serves the SSL keys and certificates to the Check Point Security Gateway.
7	HSM Client workstation used to create a Certificate Authority (CA) certificate on the HSM Server.

Note - Check Point Security Gateway uses the HSM Server only for Outbound HTTPS Inspection.

Generic Workflow

In This Section:

This section contains generic workflows for an HSM environment.

Workflow for Configuring a Check Point Security Gateway to Work with HSM

Follow the steps below on the Security Gateway / Cluster Members / Scalable Platform Security Group that must work with an HSM.

Note - Instructions for specific HSM vendors are located in the corresponding sections.

Generic Step 1 of 3: Configure the HTTPS Inspection to work without the HSM Server

Important:

- In a Cluster, you must configure all the Cluster Members in the same way.
- In a VSX environment, you must perform this step in the context of *each* Virtual System (on the VSX Gateway or *each* VSX Cluster Member).
- On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.

Step	Instructions
1	In SmartConsole, configure the HTTPS Inspection. See the *R82 Security Management Administration Guide* > Chapter *HTTPS Inspection*.

Step	Instructions

2	On the Security Gateway / *each* Cluster Member / Security Group, disable the HSM in the `$FWDIR/conf/hsm_configuration.C` file:
	a. Connect to the command line.
	b. Log in to the Expert mode.
	c. Edit the file:
	`vi $FWDIR/conf/hsm_configuration.C`
	d. Configure the value "`no`" for the parameter "`enabled`":
	`:enabled ("no")`
	e. Save the changes in the file and exit the editor.
	f. On the Scalable Platform Security Group, copy the file to all Security Group Members:
	`asg_cp2blades $FWDIR/conf/hsm_configuration.C`

3	On the Security Gateway / *each* Cluster Member / Security Group, restart Check Point services: `cprestart` **Important** - Traffic does not flow through until the services start.
4	Make sure that HTTPS Inspection works correctly without the HSM Server: a. From an internal computer, connect to any HTTPS web site. b. On the internal computer, in the web browser, you must receive the signed CA certificate from the Security Gateway / Cluster.

Generic Step 2 of 3: Install and configure the PKCS#11 library supplied by the HSM vendor

Important:

- In a Cluster, you must configure all the Cluster Members in the same way.
- In a VSX environment, you must perform this step in the context of the VSX Gateway or *each* VSX Cluster Member (context of VS 0).
- On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.
- You must get the HSM Client package from the HSM vendor.

Step	Instructions
1	Unpack and install the HSM Client package supplied by the HSM vendor.

Step	Instructions
2	Transfer the required PKCS#11 library file to the **/usr/lib/hsm_client/** directory. **Important** - For security reasons, only the root user has permissions to access this directory. You must transfer the physical file into this directory. Do **not** create a symbolic link.
3	Transfer other tools or files supplied by the HSM vendor that are required to configure the PKCS#11 library.
4	Configure the required connection or trust between with the HSM Server.
5	**Optional:** Make sure there is a trusted link with the HSM Server that is based on the PKCS#11 library. **Note** - Use the applicable tool supplied by the HSM vendor. You can also examine the trust with the Check Point command "`cpstat`").

Generic Step 3 of 3: Configure the HTTPS Inspection to work with the HSM Server for Outbound HTTPS Inspection

Important:

- In a Cluster, you must configure all the Cluster Members in the same way.
- In a VSX environment, you must perform this step in the context of *each* Virtual System (on the VSX Gateway / *each* VSX Cluster Member / Security Group).

Notes:

- In this step, you configure the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / *each* Cluster Member/ Security Group.
- After you apply the HSM configuration for the first time, you can get an HSM connection error.
  Most common scenario is when you configure several Security Gateways / Cluster Members / Security Groups to use the same HSM Server, and they access it at the same time.
  In this case:
  a. Run the "`cprestart`" command on the Security Gateway / Cluster Member / Security Group that has an HSM connection issue.
  In a VSX environment, run this command in the context of the problematic VSX Virtual System.
  b. When you see "`HSM on`" on the screen, continue to configure the next Security Gateway / Cluster Member / Security Group / VSX Virtual System.
- After any change in the `$FWDIR/conf/hsm_configuration.C` file, you must do one of these:
  - Fetch the local policy with the "`fw fetch local`" command.
  - In SmartConsole install the policy on the Security Gateway / Cluster / Security Group / VSX Virtual System object.
- If the HSM Server is **not** available when you fetch the local policy or install the policy in SmartConsole, the HTTPS Inspection **cannot** inspect the Outbound HTTPS traffic. As a result, internal computers behind the Security Gateway / Cluster / Security Group / VSX Virtual System **cannot** access HTTPS web sites.
  In addition, see *"Disabling Communication from the Security Gateway to the HSM Server" on page 137*.

Configuration steps:

Step	Instructions
1	Connect to the command line on the Security Gateway / *each* Cluster Member / Security Group.
2	Log in to the Expert mode.

3	Back up the `$FWDIR/conf/hsm_configuration.C` file.
	■ On the Security Gateway / *each* Cluster Member, run:
	`cp -v $FWDIR/conf/hsm_configuration.C{,_BKP}`
	■ On the Scalable Platform Security Group, run:
	`g_cp -v $FWDIR/conf/hsm_configuration.C{,_BKP}`

Step	Instructions
4	Edit the `$FWDIR/conf/hsm_configuration.C` file: `vi $FWDIR/conf/hsm_configuration.C`

5	Configure the required values for these attributes
	(see the corresponding sections for HSM vendors):
	`(:enabled ("no") # "yes" / "no"`
	`:hsm_vendor_name ("")`
	`:lib_filename ("")`
	`:CA_cert_public_key_handle (0)`
	`:CA_cert_private_key_handle (0)`
	`:CA_cert_buffer_handle (0)`
	`:token_id ("")`
	`)`

	Notes:
	■ The "**:enabled ()**" attribute must have the value of either "**yes**" (to enable the HSM), or "**no**" (to disable the HSM).
	■ The "**:hsm_vendor_name ()**" attribute must contain the required name of the HSM vendor.
	■ The "**:lib_filename ()**" attribute must contain the name of the PKCS#11 library of your HSM vendor (located in the **/usr/lib/hsm_client/** directory).
	■ The "**:CA_cert_<XXX> ()**" attributes must have the required values of handles.
	■ The "**:token_id ()**" attribute must contain the password for the partition on the HSM Server.
	Example:
	`(:enabled ("yes")`
	`:hsm_vendor_name ("FutureX HSM")`
	`:lib_filename ("libfxpkcs11.so")`
	`:CA_cert_public_key_handle (2)`
	`:CA_cert_private_key_handle (1)`
	`:CA_cert_buffer_handle (3)`
	`:token_id ("safest")`
	`)`

Step	Instructions
6	On the Scalable Platform Security Group, copy the file to all Security Group Members: `asg_cp2blades $FWDIR/conf/hsm_configuration.C`
7	To apply the new configuration, restart all Check Point services with this command: `cprestart` **Important** - This blocks all traffic until all services restart. In a cluster, this can cause a failover.

8	Make sure that the Security Gateway / *each* Cluster Member / Security Group can connect to the HSM Server and that HTTPS Inspection is activated successfully on the outbound traffic.
	■ On the Security Gateway / *each* Cluster Member, run:
	`cpstat https_inspection -f all`
	■ On the Scalable Platform Security Group, run:
	`g_all cpstat https_inspection -f all`
	The output must show:
	■ `HSM partition access (Accessible/Not Accessible): Accessible`
	■ `Outbound status (HSM on/HSM off/HSM error): HSM on`
	For more information, see *"Monitoring HTTPS Inspection with HSM in CLI" on page 162*.

8	Make that HTTPS Inspection is activated successfully on the outbound traffic: a. From an internal computer, connect to any HTTPS web site. b. On the internal computer, in the web browser, you must receive the signed CA certificate from the HSM Server.

Workflow for Configuring an HSM Client Workstation

HSM Client workstation is an external computer, on which you install the HSM Client software of your HSM vendor.

HSM Client workstation can run on Windows, Linux, or other operating system, as required by the HSM vendor.

You use the HSM Client workstation to:

- Create a CA Certificate on the HSM Server.

  Check Point Security Gateways / Cluster Members / Security Groups use this CA Certificate for HTTPS Inspection when it needs to store and access SSL keys on the HSM Server.

- Manage keys for a fake certificate created by the Check Point Security Gateway / Cluster Members / Security Group.

Important - You must get the HSM Client package from the HSM vendor.

Working with Gemalto HSM

In This Section:

Configuration Steps

Use this workflow to configure a Check Point Security Gateway / ClusterXL / Scalable Platform Security Group to work with the **Gemalto HSM Server**.

Step 1 of 5: Extracting the Gemalto Help Package

Use the Gemalto configuration documents to configure the Gemalto HSM environment.

Step	Instructions
1	Download this package: Gemalto SafeNet HSM Help package (**007-011136-012_Net_HSM_6.2.2_Help_RevA**) **Note** - Software Subscription or Active Support plan is required to download this package.
2	Use a Windows-based computer.
3	Extract the Gemalto HSM Help package to some folder.
4	Open the extracted Gemalto HSM Help folder.
5	Double-click the **START_HERE.html** file. The *Gemalto SafeNet Network HSM 6.2.2 Product Documentation* opens.

Step 2 of 5: Configuring the Gemalto HSM Server to Work with a Check Point Security Gateway / ClusterXL / Scalable Platform Security Group

Use the Gemalto Help documents to install and configure the Gemalto HSM Server.

Step	Instructions
1	Install the Gemalto HSM Appliance. From the *Gemalto SafeNet Network HSM 6.2.2 Product Documentation*, go to the *Installation Guide* > *SafeNet Network HSM Hardware Installation*.
2	Do the initial configuration of the Gemalto HSM Appliance and the Gemalto HSM Server. From the *Gemalto SafeNet Network HSM 6.2.2 Product Documentation*, go to the *Configuration Guide* > follow from *[Step 1]* to *[Step 6]*.
3	Run the "`sysconf recenCert`" command in LunaSH to generate a new certificate for the Gemalto HSM Server (`server.pem`). From the *Gemalto SafeNet Network HSM 6.2.2 Product Documentation*, go to the *Configuration Guide* > *[Step 7] Create a trusted link and register Client and Appliance with each other*.

Step	Instructions

4	Complete the configuration of the Gemalto HSM Server to work with the Check Point Security Gateway / ClusterXL / Security Group:
	
	a. Set the applicable partition to be active and auto-activated.
	Run these commands in LunaSH:
	`lunash:> partition showPolicies -partition <Partition Name>`
	`lunash:> partition changePolicy -partition <Partition Name> -policy 22 -value 1`
	`lunash:> partition changePolicy -partition <Partition Name> -policy 23 -value 1`
	`lunash:> partition showPolicies -partition <Partition Name>`
	
	Note - If you do not set the partition to stay auto-activated, the partition does not stay activated when the machine is shut down for more than two hours.
	
	b. Disable the validation of the client source IP address by NTLS upon an NTLA client connection.
	Run this command in LunaSH:
	`lunash:> ntls ipcheck disable`
	
	Note - This allows the HSM Server to accept traffic from Check Point Cluster Members that hide this traffic behind a Cluster VIP address, and from a Check Point Security Gateway / Security Group hidden behind NAT.

Step 3 of 5: Configuring the Gemalto HSM Client workstation

You use the Gemalto HSM Client workstation to create a CA Certificate on the Gemalto HSM Server.

Check Point Security Gateway / ClusterXL / Scalable Platform Security Group uses this CA Certificate for HTTPS Inspection to store and to access SSL keys on the Gemalto HSM Server.

Note - You can also use Check Point Security Gateway / ClusterXL / Scalable Platform Security Group with the installed HSM Client package as an HSM Client workstation.

Step	Instructions
1	Get this HSM Client package from the Gemalto vendor: **610-012382-017_SW_Client_HSM_6.2.2_RevA**
2	Install a Windows-based or Linux-based computer to use as a Gemalto HSM Client Workstation.
3	Install the HSM Client package on the computer: From the *Gemalto SafeNet Network HSM 6.2.2 Product Documentation*, go to the *Installation Guide* > *SafeNet HSM Client Software Installation*.
4	Establish a Trust Link between the Gemalto HSM Client Workstation and the Gemalto HSM Server. From the *Gemalto SafeNet Network HSM 6.2.2 Product Documentation*, go to the *Configuration Guide* > *[Step 7] Create a trusted link and register Client and Appliance with each other*. On the Gemalto HSM Client Workstation, run in LunaCM: `lunacm:> clientconfig deploy -c <IP Address of HSM Client Workstation> -n <IP Address of HSM Server> -par <Partition Name> -pw <Partition Password>`

Step 4 of 5: Creating the CA Certificate on the Gemalto HSM Server

Step	Instructions
1	On the Gemalto HSM Client workstation, open a command prompt or a terminal window.

2	Use the "`cmu generatekeypair`" command to create a key pair.
	From the *Gemalto SafeNet Network HSM 6.2.2 Product Documentation*, go to the *Utilities Reference Guide* > *Certificate Management Utility (CMU)* > *cmu generatekeypair*.
	Example:
	`# cd /usr/safenet/lunaclient/bin`
	`# ./cmu generatekeypair -modulusBits=2048 -publicExponent=65537 -labelPublic="CAPublicKeyPairLabel" -labelPrivate="CAPrivateKeyPairLabel" -sign=T -verify=T`

3	When prompted, enter the password for the partition on Gemalto HSM Server (you configured it in *"Step 2 of 5: Configuring the Gemalto HSM Server to Work with a Check Point Security Gateway / ClusterXL / Scalable Platform Security Group" on page 103*). Example: `Enter a password for the token in slot 0:`
4	Select the RSA mechanism by entering the corresponding number: `[1] PKCS [2] FIPS 186-3 Only Primes [3] FIPS 186-3 Auxiliary Primes`

5	View the handles of the key pair you created.
	From the *Gemalto SafeNet Network HSM 6.2.2 Product Documentation*, go to the *Utilities Reference Guide* > *Certificate Management Utility (CMU)* > *cmu list*.
	`# ./cmu list`
	Example output:
	`Enter password for token in slot 0 : <Password for the Partition>`
	`handle=17 label=CAPrivateKeyPairLabel`
	`handle=18 label=CAPublicKeyPairLabel`

Step	Instructions
6	Use the handle numbers from the previous step to create the CA certificate. From the *Gemalto SafeNet Network HSM 6.2.2 Product Documentation*, go to the *Utilities Reference Guide* > *Certificate Management Utility (CMU)* > *cmu selfsigncertificate* Example: `# ./cmu selfsigncertificate -privatehandle=17 CN="www.gemltoHSM.cp" -sha256WithRSA -startDate 20190720 -endDate 20240720 -serialNum=111aaa -keyusage digitalsignature,keycertsign,crlsign -basicconstraints=critical,ca:true`

7	View the handles of the CA certificate you created.
	`# ./cmu list`
	Example output:
	`Enter password for token in slot 0 : <Password for the Partition>`
	`handle=13 label=www.myhsm.cp`
	`handle=17 label=CAPrivateKeyPairLabel`
	`handle=18 label=CAPublicKeyPairLabel`
	Important - You use the numbers of these three handles later when you configure the `$FWDIR/conf/hsm_configuration.C` file on the Check Point Security Gateway / *each* Cluster Member / Scalable Platform Security Group).

8	Export the CA certificate to a file. From the *Gemalto SafeNet Network HSM 6.2.2 Product Documentation*, go to the *Utilities Reference Guide* > *Certificate Management Utility (CMU)* > *cmu export* `# ./cmu export -handle=<Handle Number> -outputfile=<Name of Output File>`

Step 5 of 5: Configuring the Security Gateway to Work with the Gemalto HSM Server

This step has three sub-steps.

Sub-Step 5-A: Configuring HTTPS Inspection on the Security Gateway / Cluster Members / Security Group to work *without* the Gemalto HSM Server

Important:

- In a Cluster, you must configure all the Cluster Members in the same way.
- In a VSX environment, you must perform this step in the context of *each* Virtual System (on the VSX Gateway or *each* VSX Cluster Member).
- On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.

Step	Instructions
1	In SmartConsole, enable and configure the HTTPS Inspection. See the *R82 Security Management Administration Guide* > Chapter *HTTPS Inspection*.

2	On the Security Gateway / *each* Cluster Member / Security Group, disable the HSM in the `$FWDIR/conf/hsm_configuration.C` file.
	a. Connect to the command line.
	b. Log in to the Expert mode.
	c. Edit the file:
	`vi $FWDIR/conf/hsm_configuration.C`
	d. Configure the value "`no`" for the parameter "`enabled`":
	`:enabled ("no")`
	e. Save the changes in the file and exit the editor.
	f. On the Scalable Platform Security Group, you must copy the updated file to all Security Group Members:
	`asg_cp2blades $FWDIR/conf/hsm_configuration.C`

3	In SmartConsole, install the applicable Access Control Policy on the Security Gateway / ClusterXL object.
4	Make sure that HTTPS Inspection works correctly without the HSM Server: a. From an internal computer, connect to any HTTPS web site. b. On the internal computer, in the web browser, you must receive the signed CA certificate from the Security Gateway / ClusterXL / Security Group.

Sub-Step 5-B: Installing the Gemalto HSM Simplified Client Software Packages on the Security Gateway / ClusterXL / Security Group

Important:

- In a Cluster, you must configure all the Cluster Members in the same way.
- In a VSX environment, you must perform this step in the context of the VSX Gateway or *each* VSX Cluster Member (context of VS 0).
- On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.

Notes:

- For more information, see the *Gemalto SafeNet Network HSM 6.2.2 Product Documentation*.
  For information about establishing a Trust Link, go to the *Appliance Administration Guide* > *Configuration without One-step NTLS* > *[Step 7] Create a Network Trust Link Between the Client and the Appliance*.
- If you need to establish new Trust Link, you have to delete the current Trust Link.
  See *"Deleting a Trust Link with the HSM Server" on page 117*.

Procedure for a Security Gateway / ClusterXL:

Step	Instructions
1	Open the Gemalto HSM Client package you received from Gemalto: **610-012382-017_SW_Client_HSM_6.2.2_RevA** Go to this directory: `linux` > `32`
2	Install the HSM Client package. From the *Gemalto SafeNet Network HSM 6.2.2 Product Documentation*, go to the *Installation Guide* > *SafeNet HSM Client Software Installation*.
3	In the Expert mode, copy the **libCryptoki2.so** file to the **/usr/lib/hsm_client/** directory: `cp -v /usr/safenet/lunaclient/lib/libCryptoki2.so /usr/lib/hsm_client/` **Important** - For security reasons, only the root user has permissions to access this directory. You must copy the physical file into this directory. Do **not** create a symbolic link.

Step	Instructions
4	Establish a Trust Link between the Gemalto HSM Client on the Security Gateway / *each* Cluster Member and the Gemalto HSM Server. From the *Gemalto SafeNet Network HSM 6.2.2 Product Documentation*, go to the *Configuration Guide* > *[Step 7] Create a trusted link and register Client and Appliance with each other*. On the Security Gateway / *each* Cluster Member, run in LunaCM: `lunacm:> clientconfig deploy -c <IP Address of Security Gateway or Cluster Member> -n <IP Address of HSM Server> -par <Partition Name> -pw <Partition Password>`
5	Examine the partition access on the Security Gateway / *each* Cluster Member: `# /usr/safenet/lunaclient/bin/vtl verify`

Procedure for a Scalable Platform Security Group:

Step	Instructions
1	Open the Gemalto HSM Client package you received from Gemalto: **610-012382-017_SW_Client_HSM_6.2.2_RevA**
2	Transfer the software package to the Security Group to some directory. For example, create **/var/log/HSM_Client/** on all Security Group Members: `g_all mkdir -v /var/log/HSM_Client/`
3	Connect to the command line on the Security Group.
4	Log in to the Expert mode.

5	Extract the Gemalto HSM Client package:
	`g_all cd /var/log/HSM_Client/`
	`g_all tar -xvf <Name of Gemalto HSM Client Package>.tar`

Step	Instructions

6	Install the Gemalto HSM Client packages on all Security Group Members:
	`g_all rpm -Uvh /var/log/HSM_Client/configurator-6.2.2-4.i386.rpm`
	`g_all rpm -Uvh /var/log/HSM_Client/libcryptoki-6.2.2-4.i386.rpm`
	`g_all rpm -Uvh /var/log/HSM_Client/vtl-6.2.2-4.i386.rpm`

7	Establish a Trust Link between the Gemalto HSM Client on the Security Group and the Gemalto HSM Server. From the *Gemalto SafeNet Network HSM 6.2.2 Product Documentation*, go to the *Configuration Guide* > *[Step 7] Create a trusted link and register Client and Appliance with each other*. On the Security Group, run in LunaCM: `lunacm:> clientconfig deploy -c <IP Address of Security Group> -n <IP Address of HSM Server> -par <Partition Name> -pw <Partition Password>`
8	Examine the partition access on the Security Group: `# /usr/safenet/lunaclient/bin/vtl verify`

Sub-Step 5-C: Configuring HTTPS Inspection on the Security Gateway / ClusterXL / Security Group to work *with* the Gemalto HSM Server

Important:

- In a Cluster, you must configure all the Cluster Members in the same way.
- In a VSX environment, you must perform this step in the context of the VSX Gateway or *each* VSX Cluster Member (context of VS 0).
- On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.

Notes:

- After you apply the HSM configuration for the first time, you may get an HSM connection error.
  Most common scenario is when you configure several Security Gateways (Cluster Members) to use the same HSM Server, and they access it at the same time.
  In this case:
  a. Run the "`fw fetch local`" command on the Security Gateway (Cluster Member) that has an HSM connection issue.
  In a VSX environment, run this command in the context of the problematic VSX Virtual System.
  b. Wait until you see "`HSM on`".
  c. Continue to configure the next Security Gateway, Cluster Member, or VSX Virtual System.
- After any change in the `$FWDIR/conf/hsm_configuration.C` file, you must do one of these:
  - Fetch the local policy with the "`fw fetch local`" command
  - In SmartConsole, install the policy on the Security Gateway / ClusterXL / VSX Virtual System object.
- If the HSM Server is **not** available when you fetch the local policy or install the policy in SmartConsole, the HTTPS Inspection **cannot** inspect the Outbound HTTPS traffic. As a result, internal computers behind the Security Gateway / ClusterXL / Security Group / VSX Virtual System **cannot** access HTTPS web sites.
  In addition, see *"Disabling Communication from the Security Gateway to the HSM Server" on page 137*.

Step	Instructions
1	Connect to the command line on the Security Gateway / *each* Cluster Member / Scalable Platform Security Group.
2	Log in to the Expert mode.

3	Back up the `$FWDIR/conf/hsm_configuration.C` file:
	■ On the Security Gateway / *each* Cluster Member, run:
	`cp -v $FWDIR/conf/hsm_configuration.C{,_BKP}`
	■ On the Scalable Platform Security Group, run:
	`g_cp -v $FWDIR/conf/hsm_configuration.C{,_BKP}`

Step	Instructions
4	Edit the `$FWDIR/conf/hsm_configuration.C` file: `vi $FWDIR/conf/hsm_configuration.C`

5	Configure the required values for these attributes:
	`(`
	`:enabled ("yes")`
	`:hsm_vendor_name ("Luna Gemalto HSM")`
	`:lib_filename ("libCryptoki2.so")`
	`:CA_cert_public_key_handle (<`**`Number of "Public" Handle for CA certificate`**`>)`
	`:CA_cert_private_key_handle (<`**`Number of "Private" Handle for CA certificate`**`>)`
	`:CA_cert_buffer_handle (<`**`Number of Handle for CA certificate`**`>)`
	`:token_id ("<`**`Password for Partition on Gemalto HSM Server`**`>")`
	`)`

Step	Instructions

	Notes:
	■ The "**:enabled ()**" attribute must have the value of either "**yes**" (to enable the HSM), or "**no**" (to disable the HSM).
	■ The "**:hsm_vendor_name ()**" attribute must contain the string "**Luna Gemalto HSM**" (or must be empty).
	■ The "**:lib_filename ()**" attribute must contain the name of the PKCS#11 library of the Gemalto HSM vendor (located in the **/usr/lib/hsm_client/** directory on the Security Gateway / *each* Cluster Member / Security Group.
	■ The "**:CA_cert_<XXX> ()**" attributes must have the required values of handles from the output of the "`cmu list`" command on the Gemalto HSM Server.
	See *"Step 4 of 5: Creating the CA Certificate on the Gemalto HSM Server" on page 106*.
	■ The "**:token_id ()**" attribute must have the contain the password for the partition on the Gemalto HSM Server.
	See *"Step 2 of 5: Configuring the Gemalto HSM Server to Work with a Check Point Security Gateway / ClusterXL / Scalable Platform Security Group" on page 103*.
	
	Example:
	`(`
	`:enabled ("yes")`
	`:hsm_vendor_name ("Gemalto HSM")`
	`:lib_filename ("libCryptoki2.so")`
	`:CA_cert_public_key_handle (17)`
	`:CA_cert_private_key_handle (18)`
	`:CA_cert_buffer_handle (13)`
	`:token_id ("p@ssw0rd")`
	`)`

Step	Instructions

6	Apply the new configuration.
	■ If you explicitly defined (or changed) the value of the "**:hsm_vendor_name ()**" attribute the string "**Gemalto HSM**", then restart all Check Point services with this command:
	• On the Security Gateway / *each* Cluster Member, run:
	`cprestart`
	• On the Scalable Platform Security Group, run:
	`g_all cprestart`
	Important - This blocks all traffic until all services restart. In a cluster, this can cause a failover.
	■ If you did **not** define the value of the "**:hsm_vendor_name ()**" attribute (it is empty), then fetch the local policy with this command:
	• On the Security Gateway / *each* Cluster Member, run:
	`fw fetch local`
	• On the Scalable Platform Security Group, run:
	`g_fw fetch local`

7	Make sure that the Security Gateway / *each* Cluster Member / Security Group can connect to the HSM Server and that HTTPS Inspection is activated successfully on the outbound traffic.
	Run this command:
	■ On the Security Gateway / *each* Cluster Member, run:
	`cpstat https_inspection -f all`
	■ On the Scalable Platform Security Group, run:
	`g_all cpstat https_inspection -f all`
	The output must show:
	■ `HSM partition access (Accessible/Not Accessible): Accessible`
	■ `Outbound status (HSM on/HSM off/HSM error): HSM on`
	For more information, see *"Monitoring HTTPS Inspection with HSM in CLI" on page 162*.

Step	Instructions
8	Make that HTTPS Inspection is activated successfully on the outbound traffic: a. From an internal computer, connect to any HTTPS web site. b. On the internal computer, in the web browser, you must receive the signed CA certificate from the HSM Server.

Additional Actions for a Gemalto HSM Server

Deleting a Trust Link with the HSM Server

If you need to establish new Trust Link between a Check Point Security Gateway and an HSM Server, you have to delete the current Trust Link.

Use Case: When you replace or reconfigure a Check Point Security Gateway, or an HSM Server.

Step	Instructions

1	Delete the current Trust Link on the Check Point Security Gateway / *each* Cluster Member / Scalable Platform Security Group:
	a. Connect to the command line.
	b. Log in to the Expert mode.
	c. Go to the SafeNet HSM Simplified Client installation directory:
	■ On the Security Gateway / *each* Cluster Member, run:
	`cd /usr/safenet/lunaclient/bin/`
	■ On the Scalable Platform Security Group, run:
	`g_all cd /usr/safenet/lunaclient/bin/`
	d. Delete the old Trust Link:
	■ On the Security Gateway / *each* Cluster Member, run:
	`./vtl deleteServer -n <IP Address of HSM Server>`
	■ On the Scalable Platform Security Group, run:
	`g_all ./vtl deleteServer -n <IP Address of HSM Server>`

2	Delete the current Trust Link on the HSM Appliance:
	a. Connect to the HSM Appliance over SSH.
	b. Examine the list of configured HSM Client Workstations:
	`lunash:> client list`
	c. Delete the Check Point HSM Client Workstation:
	`lunash:> client delete -client <Name of HSM Client>`

Note - For more information, see the *Gemalto SafeNet Network HSM 6.2.2 Product Documentation*.

Configuring a Second Interface on a Gemalto HSM Appliance for NTLS

Step	Instructions
1	Connect to the HSM Appliance over SSH.
2	Examine all the configured interfaces: `lunash:> network show`
3	Add a new interface: `lunash:> network interface -device <Name of Interface> -ip <IP Address> -netmask <NetMask> [-gateway <IP Address>]`
4	Enable Network Trust Link Service (NTLS) on all the interfaces.

Note - For more information, see the *Gemalto SafeNet Network HSM 6.2.2 Product Documentation > LunaSH Command Reference Guide > LunaSH Commands*.

Working with FutureX HSM

Use this workflow to configure a Check Point Security Gateway / ClusterXL / Scalable Platform Security Group to work with the **FutureX HSM Server**.

Prerequisites

FutureX Software Packages

The FutureX vendor supplies all these packages.

Package	Files	Description
FutureX PKCS11 Library	■ `fxpkcs11-windows-4.20-4afd.zip` ■ `fxpkcs11-redhat-4.20-4afd.tar` ■ `fxpkcs11-linux-4.20-4afd.tar` ■ `fxpkcs11-mac-4.20-4afd.tar`	Contains the FutureX PKCS #11 Library. Install on the: ■ FutureX HSM Client Workstation ■ Check Point Security Gateway / *each* Cluster Member / Scalable Platform Security Group.
FutureX CLI Utility	■ `fxcl-hsm-windows-1.2.4.2-37a8.zip` ■ `fxcl-hsm-redhat-1.2.4.2-37a8.tar` ■ `fxcl-hsm-linux-1.2.4.2-37a8.tar` ■ `fxcl-hsm-mac-1.2.4.2-37a8.tar` ■ `fxcli-hsm-commands.txt`	Contains the FutureX CLI Utility to manage keys and certificates. Install on the FutureX HSM Client Workstation.
FutureX Certificates		FutureX certificates for trust between the FutureX HSM Client Workstation and the FutureX HSM Server.

Configuration Steps

Use this workflow to configure a Check Point Security Gateway / ClusterXL / Scalable Platform Security Group to work with the **FutureX HSM Server**.

Important - Before you do the steps described below, read the FutureX integration guide.

Step 1 of 3: Configuring the FutureX HSM Client Workstation

You use the FutureX HSM Client Workstation to:

- Create a CA Certificate on the FutureX HSM Server.

  The Check Point Security Gateway / ClusterXL / Scalable Platform Security Group uses this CA Certificate for HTTPS Inspection to store and access SSL keys on the FutureX HSM Server.

- Manage keys for fake certificate the Check Point Security Gateway / ClusterXL / Scalable Platform Security Group created.

Step	Instructions
1	Install a computer to use as a FutureX HSM Client Workstation. Get the applicable HSM Client package from the FutureX vendor. A FutureX HSM Client Workstation can run these operating systems (for more information, contact the FutureX vendor): ■ Windows (contact FutureX vendor to download and install the "**FXTools**" package from the FutureX portal). ■ Red Hat Linux ■ Ubuntu Linux ■ Debian Linux ■ macOS
2	Transfer the applicable **FutureX PKCS #11 Library** package to the FutureX HSM Client Workstation. ■ For Windows OS: **fxpkcs11-windows-<BUILD>.zip** ■ For Red Hat Linux OS: **fxpkcs11-redhat-<BUILD>.tar** ■ For Ubuntu and Debian Linux OS: **fxpkcs11-linux-<BUILD>.tar** ■ For macOS: **fxpkcs11-mac-<BUILD>.tar** **Important** - Make sure to transfer the file in the binary mode.

Step	Instructions
3	Extract the contents of the **FutureX PKCS #11 Library** package to some directory on the FutureX HSM Client Workstation. In the instructions below, we show this directory as: **<PKCS#11 Dir>**. **Important:** ■ The FutureX PKCS #11 Library package (**fxpkcs11-<OS>-<BUILD>**) contains the nested directory called "**fxpkcs11**". You must extract the contents of this nested directory "**fxpkcs11**" into the **<PKCS#11 Dir>** directory. ■ The nested directory "**fxpkcs11**" contains the nested directories called "**x64**" (for 64-bit OS) and "**x86**" (for 32-bit OS). You must extract the contents of the applicable nested directory "**x64**" or "**x86**" into the **<PKCS#11 Dir>** directory.
4	Transfer the certificates you received from the FutureX vendor to some directory on the FutureX HSM Client Workstation.

Step	Instructions

5	Prepare the HSM Client to work with the PKCS#11 manager:
	a. On a Linux-based HSM Client, install the OpenSSL package:
	■ On Ubuntu and Debian Linux, run:
	`sudo apt-get install openssl`
	■ On Red Hat Linux, run:
	`sudo yum install openssl`
	b. Make sure this FutureX PKCS #11 Library file is located in the **<PKCS#11 Dir>** directory:
	■ On Linux OS:
	`libfxpkcs11.so`
	■ On Windows OS:
	`fxpkcs11.dll`
	c. Make sure the configuration file **fxpkcs11.cfg** is located in the applicable directory:
	■ On Linux OS:
	Transfer this file from the **<PKCS#11 Dir>** directory to the **/etc/** directory
	(you must edit the copied file in the **/etc/** directory).
	■ On Windows OS:
	Keep this file in the **<PKCS#11 Dir>** directory.
	d. Configure these settings in the file **fxpkcs11.cfg**:
	■ **<LOG-FILE>**
	Set the path to the log file in this attribute.
	■ **<ADDRESS>**
	Set the IP address of the FutureX HSM Server in this attribute.
	■ **<PROD-PORT>**
	Set the port on the FutureX HSM Server in this attribute.
	You can use the default port 9100, or configure a different port.
	If you use a Cloud FutureX HSM, get the port number from the FutureX Support.
	Additional related attributes:
	■ **<PROD-TLS-CA>**
	Contains the path to the Certificate Authority certificate file.
	This attribute can appear multiple times.
	You can put all the certificates of the CA chain.
	■ **<PROD-TLS-CERT>**
	Contains the path to the client certificate file.
	■ **<PROD-TLS-KEY>**
	Contains the path to the client private key file.

Step	Instructions

6	Test the PKCS#11 Library:
	a. To test the configuration, run the tool **configTest** from the **<PKCS#11 Dir>** directory.
	b. To manage keys, run the tool **PKCS11Manager** from the **<PKCS#11 Dir>** directory.
	c. Examine the log file you configured in the **<LOG-FILE>** attribute in the **fxpkcs11.cfg** file.
	Important - If you have problems with the location of the configuration file or the PKCS #11 Library file, you can set these environmental variables:
	■ **FXPKCS11_CFG** to contain the full path to the configuration file **fxpkcs11.cfg**
	■ **FXPKCS11_MODULE** to contain the full path to the PKCS #11 Library file
	To set an environmental variable:
	■ On Linux OS, use this command:
	`export VARIABLE=VALUE`
	Example:
	`export FXPKCS11_CFG=/home/user/fxpkcs11.cfg`
	■ On Windows OS, use this command:
	`set VARIABLE=VALUE`
	Example:
	`set FXPKCS11_`
	`CFG=C:\Users\Futurex\Desktop\fxpkcs11.cfg`

7	For more information about the configuration of PKCS#11 on the FutureX HSM Client Workstation: a. Log in to the FutureX portal. b. Go to: *DEVELOPER DOCUMENTATION >* *GENERAL PURPOSE >* *General Purpose Technical Reference >* *PKCS #11 Technical Reference*

Step	Instructions
8	Transfer the applicable FutureX CLI Utility package to the FutureX HSM Client Workstation. ■ For Windows OS: **fxcl-hsm-windows-<BUILD>.zip** ■ For Red Hat Linux OS: **fxcl-hsm-redhat-<BUILD>.tar** ■ For Ubuntu and Debian Linux OS: **fxcl-hsm-linux-<BUILD>.tar** ■ For macOS: **fxcl-hsm-mac-<BUILD>.tar** **Important** - Make sure to transfer the file in the binary mode.
9	Extract the contents of the FutureX CLI Utility package to some directory on the FutureX HSM Client Workstation. In the instructions below, we show this directory as: **<CLI Dir>**. **Important:** ■ The FutureX CLI Utility package (**fxcl-hsm-<OS>-<BUILD>**) contains the nested directory called "**fxcl**". ■ The nested directory **fxcl** contains the nested directories called "**x64**" (for 64-bit OS) and "**x86**" (for 32-bit OS). ■ The nested directories **x64** and **x86** contain the nested directories called "**OpenSSL-1.0.x**" and "**OpenSSL-1.1.x**". You must extract the contents of the applicable nested directory "**OpenSSL-1.0.x**" or "**OpenSSL-1.1.x**" into the **<CLI Dir>** directory. Administrator decides, which version of the OpenSSL to use (for more information, contact the FutureX vendor).
10	Transfer these certificates to the **<CLI Dir>** directory on the FutureX HSM Client Workstation: ■ The Client certificate (denoted below as **<Client Certificate>**) ■ The CA certificate (denoted below as **<CA Certificate>**)

Step	Instructions

11	Establish a connection between the FutureX HSM Client and the FutureX HSM Server:
	a. Go to the **<CLI Dir>** directory.
	b. Start the shell:
	`fxcli-hsm`
	c. Run these commands in the order they are listed:
	`tls pki -f <Client Certificate> -p safest`
	`tls ca -f <CA Certificate>`
	`connect tcp -c <IP Address of URL of HSM Server>:<Port on HSM Server>`
	`login user -u <Username> -p <Password (default is "safest")>`
	`exit`

12	You can use these tools on the FutureX HSM Client Workstation to manage keys and certificates that are stored on the FutureX HSM Server: a. **PKCS11Manager** ■ Run this command from the **<PKCS#11 Dir>** directory. ■ This tool can create keys and browse the content of the HSM partition (that stores keys and certificates). ■ Follow the tool's menu to see the available options. b. **fxcli-hsm** ■ Run this command from the **<CLI Dir>** directory. ■ To see all available commands in this shell, run: `help` ■ To see all available options for a command in this shell, either run only the command, or the command with the "`-h`" option.

Step 2 of 3: Creating the CA Certificate on the FutureX HSM Server

Step	Instructions
1	On the FutureX HSM Client Workstation, open the FutureX CLI utility.

2	Get the list of available slots.
	Run one of these commands:
	`keytable list`
	`keytable reload`

Step	Instructions

3	Generate the key pair for the CA certificate:
	`generate -a rsa -b 2048 --slot <Slot or Label of CA Certificate> --name <Name of CA Certificate Private Key File> --tpk-slot <Slot or Label of CA Certificate Public Key> --tpk-name <Name of CA Certificate Public Key File> -u sign,verify`
	Example:
	`generate -a RSA -b 2048 --slot 0 --name CAPrivateKey --tpk-slot 1 --tpk-name CAPublicKey -u sign,verify`
	Important - Do **not** use the "`... slot next`" option, because it can override keys for a fake certificate the Check Point Security Gateway / ClusterXL / Scalable Platform Security Group created.

4	Generate the CA certificate: `x509 sign --private-slot <Slot or Label of Private Key> --dn "<Distinguished Name of CA Certificate>" --ca 1 --key-usage DigitalSignature --key-usage CrlSign --key-usage KeyCertSign --save-slot <Slot to Save the CA Certificate> --save-name <Label of CA Certificate File> -o <Full Path and Name of CA Certificate File>.cer --validity-period '<Period>'` Example: `x509 sign --private-slot 0 --dn "CN=www.futurexhsm.cp" --ca 1 --key-usage DigitalSignature --key-usage KeyCertSign --key-usage CrlSign --save-slot 2 --save-name CACert -o Z:\FutureXhsm.cer --validity-period '5 years'` **Important** - Do **not** use the "`... slot next`" option, because it can override keys for a fake certificate the Check Point Security Gateway / ClusterXL / Scalable Platform Security Group created.

5	Get the list of slots used for the CA certificate and CA certificate's key pair.
	Run one of these commands:
	`keytable list`
	`keytable reload`
	Note - The command "`keytable list`" shows the slot numbers as the PKCS#11 handles plus one. For example, it shows slot 0 as handle 1, slot 1 as handle 2, and so on.

Step	Instructions

6	Write down the handles of the:
	■ CA certificate
	■ CA certificate public key
	■ CA certificate private key
	Example:
	`CAPublicKey (1)`
	`CAPrivateKey (2)`
	`CACert (3)`
	Important - You use the numbers of these three handles when you configure the `$FWDIR/conf/hsm_configuration.C` file on the Check Point Security Gateway / ClusterXL / Scalable Platform Security Group.

Step 3 of 3: Configuring the Security Gateway to Work with the FutureX HSM Server

This step has four sub-steps.

Sub-Step 3-A: Configuring HTTPS Inspection on the Security Gateway / Cluster Members / Security Group to work *without* the FutureX HSM Server

Important:

- In a Cluster, you must configure all the Cluster Members in the same way.
- In a VSX environment, you must perform this step in the context of *each* Virtual System (on the VSX Gateway or *each* VSX Cluster Member).
- On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.

Step	Instructions
1	In SmartConsole, configure the HTTPS Inspection. See the *R82 Security Management Administration Guide* > Chapter *HTTPS Inspection*.

2	On the Security Gateway / *each* Cluster Member / Security Group, disable the HSM in the `$FWDIR/conf/hsm_configuration.C` file.
	a. Connect to the command line.
	b. Log in to the Expert mode.
	c. Edit the file:
	`vi $FWDIR/conf/hsm_configuration.C`
	d. Configure the value "`no`" for the parameter "`enabled`":
	`:enabled ("no")`
	e. Save the changes in the file and exit the editor.
	f. On the Scalable Platform Security Group, you must copy the updated file to all Security Group Members:
	`asg_cp2blades $FWDIR/conf/hsm_configuration.C`

3	In SmartConsole, install the applicable Access Control Policy on the Security Gateway / ClusterXL object.
4	Make sure that HTTPS Inspection works correctly without the HSM Server: a. From an internal computer, connect to any HTTPS web site. b. On the internal computer, in the web browser, you must receive the signed CA certificate from the Security Gateway / ClusterXL / Security Group.

Sub-Step 3-B: Installing the required software packages on the Security Gateway / Cluster Members / Security Group)

Important:

- In a Cluster, you must configure all the Cluster Members in the same way.
- In a VSX environment, you must perform this step in the context of the VSX Gateway or *each* VSX Cluster Member (context of VS 0).
- On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.

Step	Instructions

1	Transfer the FutureX PKCS #11 binary files to the Security Gateway / *each* Cluster Member / Scalable Platform Security Group:
	a. Open the **FutureX PKCS#11 Library** package on your computer.
	b. Go to this folder:
	fxpkcs11-linux-<BUILD> > **fxpkcs11** > **x86** > **OpenSSL-1.1.x**
	c. Transfer these files to the Security Gateway / *each* Cluster Member / Security Group to the **/usr/lib/hsm_client/** directory:
	■ **libfxpkcs11.so**
	■ **configTest**
	Important - Make sure to transfer the files in the binary mode.
	d. On the Scalable Platform Security Group, you must copy these files to all Security Group Members:
	`asg_cp2blades /usr/lib/hsm_client/libfxpkcs11.so`
	`asg_cp2blades /usr/lib/hsm_client/configTest`

2	Transfer the FutureX PKCS #11 configuration file to the Security Gateway / *each* Cluster Member / Scalable Platform Security Group: a. Open the **FutureX PKCS#11 Library** package on your computer. b. Go to this folder: **fxpkcs11-linux-<BUILD>** > **fxpkcs11** c. Transfer this file to the Security Gateway / *each* Cluster Member / Scalable Platform Security Group to the **/etc/** directory: **fxpkcs11.cfg** d. On the Scalable Platform Security Group, you must copy this file to all Security Group Members: `asg_cp2blades /usr/lib/hsm_client/fxpkcs11.cfg`

Sub-Step 3-C: Configuring a connection between the Security Gateway / Cluster Members / Security Group and the FutureX HSM Server

To establish a connection between a Check Point Security Gateway (HSM client) to a FutureX HSM server, you must create certificate files for the TLS authentication between the Check Point Security Gateway and the FutureX HSM server. These are the options to create the required certificate files:

- Create the certificates on the HSM (the most common method).
- Get the certificates from the FutureX vendor.
- Enabling the "`Anonymous`" setting on the HSM server, so that mutual authentication is not required (see the FutureX Integration Guide).

Important:

- In a Cluster, you must configure all the Cluster Members in the same way.
- In a VSX environment, you must perform this step in the context of the VSX Gateway or *each* VSX Cluster Member (context of VS 0).
- On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.

Step	Instructions
1	Transfer the FutureX certificate files you received from the FutureX vendor to the Security Gateway / *each* Cluster Member / Scalable Platform Security Group to the **/usr/futurex/** directory. On the Scalable Platform Security Group, you must copy these certificate files to all Security Group Members: `asg_cp2blades /usr/futurex/<Name of Certificate File>`
2	Connect to the command line on the Security Gateway / *each* Cluster Member / Security Group.
3	Log in to the Expert mode.

4	Back up the configuration file **/etc/fxpkcs11.cfg**:
	■ On the Security Gateway / *each* Cluster Member, run:
	`cp -v /etc/fxpkcs11.cfg{,_BKP}`
	■ On the Scalable Platform Security Group, run:
	`g_cp -v /etc/fxpkcs11.cfg{,_BKP}`

<table>
<tr><th>Step</th><th>Instructions</th></tr>
<tr><td>5</td><td>Edit the configuration file /etc/fxpkcs11.cfg:
<pre>vi /etc/fxpkcs11.cfg</pre></td></tr>
<tr><td>6</td><td>Configure these attribute values:
<table>
<tr><th>Attribute</th><th>Attribute Value</th></tr>
<tr><td><LOG-FILE></td><td>/var/log/fxpkcs11.log</td></tr>
<tr><td><ADDRESS></td><td>The IP address (or URL) of the FutureX HSM Server.</td></tr>
<tr><td><PROD-PORT></td><td>The port on the FutureX HSM Server.
You can use the default port 9100, or configure a different port.</td></tr>
<tr><td><PROD-TLS-CA></td><td>The path to the Certificate Authority certificate file.
This attribute can appear multiple times.</td></tr>
<tr><td><PROD-TLS-CERT></td><td>The path to the client certificate file.</td></tr>
<tr><td><PROD-TLS-KEY></td><td>The path to the client private key file.</td></tr>
</table></td></tr>
<tr><td>7</td><td>Save the changes in the file and exit the editor.</td></tr>
<tr><td>8</td><td>On the Scalable Platform Security Group, you must copy the updated file to all Security Group Members:
<pre>asg_cp2blades /etc/fxpkcs11.cfg</pre></td></tr>
<tr><td>9</td><td>Create the required symbolic link:

On the Security Gateway / each Cluster Member, run:
<pre>ln -s /var/log/fxpkcs11.log /tmp/fxpkcs11.log</pre>
On the Scalable Platform Security Group, run:
<pre>g_all ln -s /var/log/fxpkcs11.log
/tmp/fxpkcs11.log</pre>
</td></tr>
</table>

Sub-Step 3-D: Configuring HTTPS Inspection on the Security Gateway / Cluster Members / Security Group to work *with* the FutureX HSM Server

Important:

- In a Cluster, you must configure all the Cluster Members in the same way.
- In a VSX environment, you must perform this step in the context of the VSX Gateway or *each* VSX Cluster Member (context of VS 0).
- On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.

Notes:

- After you apply the HSM configuration for the first time, you can get an HSM connection error.
  Most common scenario is when you configure several Security Gateways / Cluster Members / Scalable Platform Security Groups to use the same HSM Server, and they access it at the same time.
  In this case:
  a. Run the "`fw fetch local`" command on the Security Gateway / *each* Cluster Member / Security Group that has an HSM connection issue.
  In a VSX environment, run this command in the context of the problematic VSX Virtual System.
  b. When you see "`HSM on`" on the screen, continue to configure the next Security Gateway, Cluster Member, Security Group, or VSX Virtual System.
- After any change in the `$FWDIR/conf/hsm_configuration.C` file, you must do one of these:
  - Fetch the local policy with the "`fw fetch local`" command
  - In SmartConsole, install the policy on the Security Gateway / ClusterXL / VSX Virtual System object.
- If the HSM Server is **not** available when you fetch the local policy or install the policy in SmartConsole, the HTTPS Inspection **cannot** inspect the Outbound HTTPS traffic. As a result, internal computers behind the Security Gateway / ClusterXL / VSX Virtual System **cannot** access HTTPS web sites.
  In addition, see *"Disabling Communication from the Security Gateway to the HSM Server" on page 137*.

Step	Instructions
1	Connect to the command line on the Security Gateway / *each* Cluster Member / Scalable Platform Security Group.
2	Log in to the Expert mode.

Step	Instructions

3	Back up the `$FWDIR/conf/hsm_configuration.C` file:
	■ On the Security Gateway / *each* Cluster Member, run:
	`cp -v $FWDIR/conf/hsm_configuration.C{,_BKP}`
	■ On the Scalable Platform Security Group, run:
	`g_cp -v $FWDIR/conf/hsm_configuration.C{,_BKP}`

4	Edit the `$FWDIR/conf/hsm_configuration.C` file: `vi $FWDIR/conf/hsm_configuration.C`

5	Configure the required values for these attributes:
	`(`
	`:enabled ("yes")`
	`:hsm_vendor_name ("FutureX HSM")`
	`:lib_filename ("")`
	`:CA_cert_public_key_handle (<`**`Number of "CAPublicKey" Handle for CA certificate`**`>)`
	`:CA_cert_private_key_handle (<`**`Number of "CAPrivateKey" Handle for CA certificate`**`>)`
	`:CA_cert_buffer_handle (<`**`Number of "CACert" Handle for CA certificate`**`>)`
	`:token_id ("<`**`Password for Partition on FutureX HSM Server`**`>")`
	`)`

Step	Instructions

	Notes:
	■ The "**:enabled ()**" attribute must have the value of either "**yes**" (to enable the HSM), or "**no**" (to disable the HSM).
	■ The "**:hsm_vendor_name ()**" attribute must contain the string "**FutureX HSM**".
	■ The "**:lib_filename ()**" attribute must contain the full path to the file **libfxpkcs11.so** (from the FutureX PKCS #11 Library) on the Security Gateway / *each* Cluster Member / Security Group
	You must configure this full path explicitly, if this file is **not** located at the default path: **/usr/lib/libfxpkcs11.so**
	■ The "**:CA_cert_<XXX> ()**" attributes must have the required values of handles from the output of the "`keytable`" command on the FutureX HSM Server.
	See *"Step 2 of 3: Creating the CA Certificate on the FutureX HSM Server" on page 125*.
	■ The "**:token_id ()**" attribute must have the contain the password for the partition on the FutureX HSM Server.
	Example:
	`(:enabled ("yes")`
	`:hsm_vendor_name ("FutureX HSM")`
	`:lib_filename ("")`
	`:CA_cert_public_key_handle (1)`
	`:CA_cert_private_key_handle (2)`
	`:CA_cert_buffer_handle (3)`
	`:token_id ("p@ssw0rd")`
	`)`

Step	Instructions

6	Apply the new configuration.
	■ If you explicitly defined (or changed) the value of the "**:hsm_vendor_name ()**" attribute to the string "**FutureX HSM**", then restart all Check Point services with this command:
	• On the Security Gateway / *each* Cluster Member, run:
	`cprestart`
	• On the Scalable Platform Security Group, run:
	`g_all cprestart`
	Important - This blocks all traffic until all services restart. In a cluster, this can cause a failover.
	■ If the value of the "**:hsm_vendor_name ()**" attribute already contained the string "**FutureX HSM**", then fetch the local policy with this command:
	• On the Security Gateway / *each* Cluster Member, run:
	`fw fetch local`
	• On the Scalable Platform Security Group, run:
	`g_fw fetch local`

7	Make sure that the Security Gateway / *each* Cluster Member / Security Group can connect to the HSM Server and that HTTPS Inspection is activated successfully on the outbound traffic.
	Run this command:
	■ On the Security Gateway / *each* Cluster Member, run:
	`cpstat https_inspection -f all`
	■ On the Scalable Platform Security Group, run:
	`g_all cpstat https_inspection -f all`
	The output must show:
	■ `HSM partition access (Accessible/Not Accessible): Accessible`
	■ `Outbound status (HSM on/HSM off/HSM error): HSM on`
	For more information, see *"Monitoring HTTPS Inspection with HSM in CLI" on page 162*.

Step	Instructions
8	Make that HTTPS Inspection is activated successfully on the outbound traffic: a. From an internal computer, connect to any HTTPS web site. b. On the internal computer, in the web browser, you must receive the signed CA certificate from the HSM Server.

Note - If there is a connectivity issue from the Check Point Security Gateway / Cluster Member / Security Group to the FutureX HSM Server, then perform these steps on the Security Gateway / Cluster Member / Security Group:

1. Examine the **/var/log/fxpkcs11.log** file.
   If you do not see a root cause in this log file, continue to the next step to configure verbose logs.
2. Configure these logging settings in the **/etc/fxpkcs11.cfg** file to see more information in the log file:
   - **LOG-TRAFFIC: YES**
   - **LOG-MODE: INFO**
     or
     LOG-MODE: ERROR

Disabling Communication from the Security Gateway to the HSM Server

You can disable communication from the Check Point Security Gateway / Cluster Members / Scalable Platform Security Group to an HSM Server. For example, when the HSM Server is under maintenance.

Important:

- In a Cluster, you must configure all the Cluster Members in the same way.
- In a VSX environment, you must perform this step in the context of *each* Virtual System (on the VSX Gateway or *each* VSX Cluster Member).
- On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.

Step	Instructions
1	Connect to the command line on the Security Gateway / *each* Cluster Member/ Security Group.
2	Log in to the Expert mode.
3	Edit the `$FWDIR/conf/hsm_configuration.C` file: `vi $FWDIR/conf/hsm_configuration.C`
4	Configure the value "`no`" for the parameter "`enabled`": `:enabled ("no")`
5	Save the changes in the file and exit the editor.
6	On the Scalable Platform Security Group, you must copy the updated file to all Security Group Members: `asg_cp2blades $FWDIR/conf/hsm_configuration.C`
7	On the Security Gateway / *each* Cluster Member / Security Group, restart Check Point services: `cprestart` **Important** - Traffic does not flow through until the services start.

Monitoring HTTPS Inspection When Security Gateway Works with HSM

When HTTPS Inspection daemon **wstlsd** initializes on a Check Point Security Gateway / Cluster Member / Scalable Platform Security Group, it checks whether this Security Gateway / Cluster Member / Security Group is configured to work with an HSM Server.

- You can see the applicable logs in SmartConsole > **Logs & Events** > **Logs** tab.

  See *"Monitoring HTTPS Inspection with HSM in SmartConsole Logs" on page 139*.

- You can query the HTTPS Inspection on the Security Gateway / Cluster Members / Security Group over SNMP.

  See *"Monitoring HTTPS Inspection with HSM over SNMP" on page 143*.

- You can run the "`cpstat https_inspection`" command on the Security Gateway / Cluster Members / Security Group.

  See *"Monitoring HTTPS Inspection with HSM in CLI" on page 162*.

Note - To see detailed information about **wstlsd** initialization, follow sk105559: How to debug WSTLSD daemon.

Monitoring HTTPS Inspection with HSM in SmartConsole Logs

To see the HTTPS Inspection logs about the Gemalto HSM Server in SmartConsole:

Step	Instructions
1	From the left navigation panel, click **Logs & Events** > **Logs**.
2	In the search field, enter: `type:Control`
3	Double-click the applicable log.
4	In the log, refer to the **More** section.

Possible logs are:

Log Description	Log Additional Information	Explanation
`HSM is enabled for outbound HTTPS inspection with <HSM Vendor>`		■ The value of the **:enabled()** attribute is set to **"yes"** in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group Security Group. ■ The *<HSM Vendor>* is the value of the **":hsm_vendor_name ()"** attribute in the `$FWDIR/conf/hsm_configuration.C` file on the on the Security Gateway / Cluster Member / Security Group.

Log Description	Log Additional Information	Explanation
`HSM is disabled for outbound HTTPS inspection`		One of these: ■ The HSM Client software packages are **not** installed on the Security Gateway / Cluster Member / Security Group. ■ The `$FWDIR/conf/hsm_configuration.C` file does **not** exist on the Security Gateway / Cluster Member / Security Group. ■ The value of the **:enabled()** attribute is set to **"no"** in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group. ■ The **:enabled()** attribute is corrupted in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group. **Important** - In these cases, outbound HTTPS Inspection works without the HSM Server, and SSL keys are stored on the Security Gateway / Cluster Member / Security Group.
`Outbound HTTPS inspection works with HSM`	`Gateway is connected to HSM`	All these conditions were met: 1. The value of the "**:enabled()**" attribute is set to **"yes"** in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group. 2. Security Gateway / Cluster Member / Security Group connected to the HSM Server.

Log Description	Log Additional Information	Explanation
`Outbound HTTPS inspection is off due to HSM error`	One of these strings: ■ `HSM configuration file is corrupted` ■ `Loading HSM library failed` ■ `There is no trust or no connectivity with HSM server` ■ `Login to HSM partition failed` ■ `Error importing CA certificate from HSM server` ■ `Error generating key pair on HSM server`	See the section **Log Additional Information** in the log.

Gateway is connected to HSM.

Monitoring HTTPS Inspection with HSM over SNMP

You can query the HTTPS Inspection status and the status of connection to the HSM Server on the Security Gateway / Cluster Member / Security Group over SNMP:

- Full OID is:

```
.iso.org.dod.internet.private.enterprises.checkpoint.products
.httpsInspection
```

- Numerical OID is:

```
.1.3.6.1.4.1.2620.1.54
```

"HTTPS Inspection status"

To get the **HTTPS Inspection status**, query this SNMP object:

SNMP OID	Returned strings	Explanation
`httpsInspectionStatus` .1.3.6.1.4.1.2620.1.54.1	`On`	HTTPS Inspection feature is configured on the Security Gateway / Cluster Member / Security Group.
	`Off`	HTTPS Inspection feature is **not** configured on the Security Gateway / Cluster Member / Security Group.

"HTTPS Inspection status description"

To get the **HTTPS Inspection status description**, query this SNMP object:

SNMP OID	Returned strings	Explanation
`httpsInspectionStatusDescription` .1.3.6.1.4.1.2620.1.54.2	`HTTPS Inspection is on`	HTTPS Inspection feature is configured on the Security Gateway / Cluster Member / Security Group.
	`HTTPS Inspection is off`	HTTPS Inspection feature is **not** configured on the Security Gateway / Cluster Member / Security Group.

"HSM configuration status"

To get the **HSM configuration status**, query this SNMP object:

SNMP OID	Returned strings	Explanation
`hsmStatus.hsmEnabled` .1.3.6.1.4.1.2620.1.54.3.1	`Enabled`	The value of the "**:enabled()**" attribute is set to **"yes"** in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group.
	`Disabled`	One of these: ■ The HSM Client software packages are **not** installed on the Security Gateway / Cluster Member / Security Group. ■ The `$FWDIR/conf/hsm_configuration.C` file does **not** exist on the Security Gateway / Cluster Member / Security Group. ■ The value of the "**:enabled()**" attribute is set to **"no"** in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group. ■ The "**:enabled()**" attribute is corrupted in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group. **Important** - In these cases, outbound HTTPS Inspection works without the HSM Server, and SSL keys are stored on the Security Gateway / Cluster Member / Security Group.

"HSM configuration status description"

To get the **HSM configuration status description**, query this SNMP object:

SNMP OID	Returned strings	Explanation
`hsmStatus.hsmEnabledDescription` .1.3.6.1.4.1.2620.1.54.3.2	`HSM is enabled for HTTPS inspection with <HSM Vendor>`	■ The value of the **:enabled()** attribute is set to **"yes"** in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group. ■ The *<HSM Vendor>* is the value of the **":hsm_vendor_name()"** attribute in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group.

SNMP OID	Returned strings	Explanation
	`HSM is disabled for HTTPS inspection`	One of these: ■ The HSM Client software packages are **not** installed on the Security Gateway / Cluster Member / Security Group. ■ The `$FWDIR/conf/hsm_configuration.C` file does **not** exist on the Security Gateway / Cluster Member / Security Group. ■ The HTTPS Inspection daemon **wstlsd** failed to read the value of the "**:enabled()**" attribute in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group. ■ The "**:enabled()**" attribute is corrupted in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group.

SNMP OID	Returned strings	Explanation
	■ The HSM Client software packages are **not** installed on the Security Gateway / Cluster Member / Security Group. ■ The `$FWDIR/conf/hsm_configuration.C` file does **not** exist on the Security Gateway / Cluster Member / Security Group.	

SNMP OID	Returned strings	Explanation
	■ The HTTPS Inspection daemon **wstlsd** failed to read the value of the "**:enabled ()**" attribute in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group.	

SNMP OID	Returned strings	Explanation
	■ The "**:enabled ()**" attribute is corrupted in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group. **Important** - In these cases, outbound HTTPS Inspection works without the HSM Server, and SSL keys are stored on the Security Gateway / Cluster Member / Security Group.	

"HSM partition access status"

To get the **HSM partition access status**, query this SNMP object:

SNMP OID	Returned strings	Explanation
`hsmStatus.hsmPartitionAccess` .1.3.6.1.4.1.2620.1.54.3.3	`N/A`	Security Gateway / Cluster Member / Security Group failed to check the access to its partition on the HSM Server. Most probably, because HSM configuration is disabled on the Security Gateway / Cluster Member / Security Group.
	`Accessible`	Security Gateway / Cluster Member / Security Group accessed its partition on the HSM Server.
	`Not Accessible`	Security Gateway / Cluster Member / Security Group failed to access its partition on the HSM Server because of an error.

"HSM partition access status description"

To get the **HSM partition access status description**, query this SNMP object:

SNMP OID	Returned strings	Explanation
`hsmStatus.hsmPartitionAccessDescription` .1.3.6.1.4.1.2620.1.54.3.4	`HSM partition access cannot be checked`	Security Gateway / Cluster Member / Security Group failed to check the access to its partition on the HSM Server.
	`Gateway can access HSM partition for HTTPS inspection`	Security Gateway / Cluster Member / Security Group accessed its partition on the HSM Server.
	`Gateway cannot access HSM partition for HTTPS inspection: <Error Message>`	Security Gateway / Cluster Member / Security Group failed to access its partition on the HSM Server because of an error. Possible error messages are: ■ `HSM configuration file is corrupted` ■ `Loading HSM library failed` ■ `There is no trust or no connectivity with HSM server` ■ `Login to HSM partition failed`

"Outbound HTTPS Inspection status"

To get the **Outbound HTTPS Inspection status**, query this SNMP object:

SNMP OID	Returned strings	Explanation
`hsmStatus.outboundStatus` .1.3.6.1.4.1.2620.1.54.3.5	`N / A`	When the HTTPS Inspection daemon **wstlsd** starts, it is necessary to wait for one minute or less, until you can get the actual status.

SNMP OID	Returned strings	Explanation
	`HSM on`	All these conditions were met: 1. The value of the "**:enabled()**" attribute is set to **"yes"** in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group. 2. Security Gateway / Cluster Member / Security Group connected to the HSM Server.

SNMP OID	Returned strings	Explanation
	`HSM off`	One of these: ■ The HSM Client software packages are **not** installed on the Security Gateway / Cluster Member / Security Group. ■ The `$FWDIR/conf/hsm_configuration.C` file does **not** exist on the Security Gateway / Cluster Member / Security Group. ■ The value of the "**:enabled()**" attribute is set to **"no"** in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group. ■ The "**:enabled()**" attribute is corrupted in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group. **Important** - In these cases, outbound HTTPS Inspection works without the HSM Server, and SSL keys are stored on the Security Gateway / Cluster Member / Security Group.

SNMP OID	Returned strings	Explanation
	`HSM error`	All these conditions were met: 1. The value of the "**:enabled()**" attribute is set to **"yes"** in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group. 2. An error occurred. **Important** - In this case, outbound HTTPS Inspection does **not** work, and HTTPS traffic does **not** pass through.

Note - The conditions for the returned strings are calculated on the Security Gateway / Cluster Member / Security Group during the start of the HTTPS Inspection daemon `wstlsd`, or during policy installation. For example, you can get "`hsmStatus.hsmEnabled = HSM enabled`" and "`hsmStatus.outboundStatus = HSM off`", because when the `wstlsd` daemon started, or during last policy installation, the HSM configuration was disabled.

"Outbound HTTPS Inspection status description"

To get the **Outbound HTTPS Inspection status description**, query this SNMP object:

SNMP OID	Returned strings	Explanation
`hsmStatus.outboundStatusDescription` .1.3.6.1.4.1.2620.1.54.3.6	`Cannot get HTTPS inspection outbound status. Process may be under initialization. Please try again in a minute.`	When the HTTPS Inspection daemon **wstlsd** starts, it is necessary to wait for one minute or less, until you can get the actual status.

SNMP OID	Returned strings	Explanation
	`Outbound HTTPS inspection works with HSM`	All these conditions were met: 1. The value of the **":enabled()"** attribute is set to **"yes"** in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group. 2. Security Gateway / Cluster Member / Security Group connected to the HSM Appliance Server.
	`Outbound HTTPS inspection works without HSM`	The value of the **":enabled()"** attribute is set to **"no"** in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group, or this file does **not** exist.

SNMP OID	Returned strings	Explanation
	`Outbound HTTPS inspection is off due to HSM error: <Error Message>`	All these conditions were met: 1. The value of the **":enabled()"** attribute is set to **"yes"** in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group. 2. An error occurred. **Important** - In this case, outbound HTTPS Inspection does **not** work, and HTTPS traffic does **not** pass through. Possible error messages are: ■ `HSM configuration file is corrupted` ■ `Loading HSM library failed` ■ `There is no trust or no connectivity with HSM server` ■ `Login to HSM partition failed` ■ `Error importing CA certificate from HSM server`

SNMP OID	Returned strings	Explanation
		■ `Error generating key pair on HSM server`

Note - The conditions for the returned strings are calculated on the Security Gateway / Cluster Member / Security Group during the start of the HTTPS Inspection daemon `wstlsd`, or during policy installation. For example, you can get "`hsmStatus.hsmEnabledDescription = HSM is enabled for HTTPS inspection with <HSM Vendor>`" and "`hsmStatus.outboundStatusDescription = Outbound HTTPS inspection works without HSM`", because when the `wstlsd` daemon started, or during last policy installation, the HSM configuration was disabled.

Examples

```
# snmpwalk -m $CPDIR/lib/snmp/chkpnt.mib -On -v 2c -c public localhost 1.3.6.1.4.1.2620.1.54

.1.3.6.1.4.1.2620.1.54.1.0 = STRING: On
.1.3.6.1.4.1.2620.1.54.2.0 = STRING: HTTPS Inspection is on
.1.3.6.1.4.1.2620.1.54.3.1.0 = STRING: Enabled
.1.3.6.1.4.1.2620.1.54.3.2.0 = STRING: HSM is enabled for HTTPS inspection with Gemalto HSM
.1.3.6.1.4.1.2620.1.54.3.3.0 = STRING: Accessible
.1.3.6.1.4.1.2620.1.54.3.4.0 = STRING: Gateway can access HSM partition for HTTPS inspection
.1.3.6.1.4.1.2620.1.54.3.5.0 = STRING: HSM on
.1.3.6.1.4.1.2620.1.54.3.6.0 = STRING: Outbound HTTPS inspection works with HSM
```

```
# snmpwalk -m $CPDIR/lib/snmp/chkpnt.mib -Oa -v 2c -c public localhost 1.3.6.1.4.1.2620.1.54

CHECKPOINT-MIB::httpsInspectionStatus.0 = STRING: On
CHECKPOINT-MIB::httpsInspectionStatusDescription.0 = STRING: HTTPS Inspection is on
CHECKPOINT-MIB::hsmEnabled.0 = STRING: Enabled
CHECKPOINT-MIB::hsmEnabledDescription.0 = STRING: HSM is enabled for HTTPS inspection with
Gemalto HSM
CHECKPOINT-MIB::hsmPartitionAccess.0 = STRING: Accessible
CHECKPOINT-MIB::hsmPartitionAccessDescription.0 = STRING: Gateway can access HSM partition
for HTTPS inspection
CHECKPOINT-MIB::outboundStatus.0 = STRING: HSM on
CHECKPOINT-MIB::outboundStatusDescription.0 = STRING: Outbound HTTPS inspection works with
HSM
```

For more information about SNMP on Gaia OS, see the *R82 Gaia Administration Guide* > Chapter *System Management* > Section *SNMP*.

Monitoring HTTPS Inspection with HSM in CLI

Run the "**cpstat https_inspection**" command on the Security Gateway / Cluster Member / Scalable Platform Security Group to see the HTTPS Inspection status and the status of connection to the HSM Server.

Syntax

- On the Security Gateway / *each* Cluster Member, run:

```
cpstat -h
cpstat https_inspection -f {default | hsm_status | all}
```

- On the Scalable Platform Security Group, run:

```
cpstat -h
g_all cpstat https_inspection -f {default | hsm_status | all}
```

For more information about this command, see the *R82 CLI Reference Guide* > Chapter *Security Gateway Commands* > Section *cpstat*.

Example outputs

```
[Expert@GW:0]# cpstat https_inspection -f default

HTTPS inspection status (On/Off):    On
HTTPS inspection status description: HTTPS Inspection is on

[Expert@GW:0]#
```

```
[Expert@GW:0]# cpstat https_inspection -f hsm_status

HSM enabled (Enabled/Disabled):                  Enabled
HSM enabled description:                         HSM is enabled for HTTPS inspection with
Gemalto HSM
HSM partition access (Accessible/Not Accessible): Accessible
HSM partition access description:                 Gateway can access to HSM partition for
HTTPS inspection
Outbound status (HSM on/HSM off/HSM error):      HSM on
Outbound status description:                     Outbound HTTPS inspection works with HSM

[Expert@GW:0]#
```

```
[Expert@GW:0]# cpstat https_inspection -f all

HTTPS inspection status (On/Off):                On
HTTPS inspection status description:             HTTPS Inspection is on
HSM enabled (Enabled/Disabled):                  Enabled
HSM enabled description:                         HSM is enabled for HTTPS inspection with
Gemalto HSM
HSM partition access (Accessible/Not Accessible): Accessible
HSM partition access description:                 Gateway can access to HSM partition for
HTTPS inspection
Outbound status (HSM on/HSM off/HSM error):      HSM on
Outbound status description:                     Outbound HTTPS inspection works with HSM

[Expert@GW:0]#
```

Explanation about the "HTTPS Inspection status"

Item	Possible returned strings	Explanation
`HTTPS inspection status (On/Off)`	`On`	HTTPS Inspection feature is configured on the Security Gateway / Cluster Member / Security Group.
	`Off`	HTTPS Inspection feature is **not** configured on the Security Gateway / Cluster Member / Security Group.

Explanation about the "HTTPS Inspection status description"

Item	Possible returned strings	Explanation
`HTTPS inspection status description`	`HTTPS Inspection is on`	HTTPS Inspection feature is configured on the Security Gateway / Cluster Member / Security Group.
	`HTTPS Inspection is off`	HTTPS Inspection feature is **not** configured on the Security Gateway / Cluster Member / Security Group.

Explanation about the "HSM configuration status"

Item	Possible returned strings	Explanation
`HSM enabled (Enabled/Disabled)`	`Enabled`	The value of the **:enabled()** attribute is set to **"yes"** in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group.
	`Disabled`	One of these: ■ The HSM Client software packages are **not** installed on the Security Gateway / Cluster Member / Security Group. ■ The `$FWDIR/conf/hsm_configuration.C` file does **not** exist on the Security Gateway / Cluster Member / Security Group. ■ The value of the **:enabled()** attribute is set to **"no"** in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group. ■ The **:enabled()** attribute is corrupted in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group. **Important** - In these cases, outbound HTTPS Inspection works without the HSM Server, and SSL keys are stored on the Security Gateway (Cluster Members).

Explanation about the "HSM configuration status description"

Item	Possible returned strings	Explanation
`HSM enabled description`	`HSM is enabled for HTTPS inspection with <HSM Vendor>`	■ The value of the **:enabled()** attribute is set to **"yes"** in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group. ■ The *<HSM Vendor>* is the value of the **":hsm_vendor_name ()"** attribute in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group.
	`HSM is disabled for HTTPS inspection`	One of these: ■ The HSM Client software packages are **not** installed on the Security Gateway / Cluster Member / Security Group. ■ The `$FWDIR/conf/hsm_configuration.C` file does **not** exist on the Security Gateway / Cluster Member / Security Group. ■ The HTTPS Inspection daemon **wstlsd** failed to read the value of the **":enabled()"** attribute in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group. ■ The **":enabled()"** attribute is corrupted in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group. **Important** - In these cases, outbound HTTPS Inspection works without the HSM Server, and SSL keys are stored on the Security Gateway (Cluster Members).

Explanation about the "HSM partition access status"

Item	Possible returned strings	Explanation
`HSM partition access (Accessible/Not Accessible)`	`N/A`	Security Gateway / Cluster Member / Security Group failed to check the access to its partition on the HSM Server.
	`Accessible`	Security Gateway / Cluster Member / Security Group accessed its partition on the HSM Server.
	`Not Accessible`	Security Gateway / Cluster Member / Security Group failed to access its partition on the HSM Server because of an error. **Important** - In this case, outbound HTTPS Inspection does **not** work, and HTTPS traffic does **not** pass through.

Explanation about the "HSM partition access status description"

Item	Possible returned strings	Explanation
`HSM partition access description`	`HSM partition access cannot be checked`	Security Gateway / Cluster Member / Security Group failed to check the access to its partition on the HSM Server. Most probably, because HSM configuration is disabled on the Security Gateway / Cluster Member / Security Group.
	`Gateway can access HSM partition for HTTPS inspection`	Security Gateway / Cluster Member / Security Group accessed its partition on the HSM Server.
	`Gateway cannot access HSM partition for HTTPS inspection: <Error Message>`	Security Gateway / Cluster Member / Security Group failed to access its partition on the HSM Server because of an error. All these conditions were met: 1. The value of the **:enabled()** attribute is set to **"yes"** in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group. 2. An error occurred. Possible error messages are: ■ `HSM configuration file is corrupted` ■ `Loading HSM library failed` ■ `There is no trust or no connectivity with HSM server` ■ `Login to HSM partition failed` **Important** - In this case, outbound HTTPS Inspection does **not** work, and HTTPS traffic does **not** pass through.

Explanation about the "Outbound HTTPS Inspection status"

Item	Possible returned strings	Explanation
`Outbound status (HSM on/HSM off/HSM error)`	`N / A`	When the HTTPS Inspection daemon **wstlsd** starts, it is necessary to wait for one minute or less, until you can get the actual status.

Item	Possible returned strings	Explanation
	`HSM on`	All these conditions were met: 1. The value of the **:enabled()** attribute is set to **"yes"** in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group. 2. Security Gateway / Cluster Member / Security Group connected to the HSM Server.
	`HSM off`	One of these: ■ The HSM Client software packages are **not** installed on the Security Gateway / Cluster Member / Security Group. ■ The `$FWDIR/conf/hsm_configuration.C` file does **not** exist on the Security Gateway / Cluster Member / Security Group. ■ The value of the **:enabled()** attribute is set to **"no"** in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group. ■ The "**:enabled()**" attribute is corrupted in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group. **Important** - In these cases, outbound HTTPS Inspection works without the HSM Server, and SSL keys are stored on the Security Gateway (Cluster Members).
	`HSM error`	All these conditions were met: 1. The value of the **:enabled()** attribute is set to **"yes"** in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group. 2. An error occurred. **Important** - In this case, outbound HTTPS Inspection does **not** work, and HTTPS traffic does **not** pass through.

Note - The conditions for the returned strings are calculated on the Security Gateway / Cluster Member / Security Group during the start of the HTTPS Inspection daemon `wstlsd`, or during policy installation. For example, you can get "`HSM enabled (Enabled/Disabled) = Enabled`" and "`Outbound status (HSM on/HSM off/HSM error) = HSM off`", because when the `wstlsd` daemon started, or during last policy installation, the HSM configuration was disabled.

Explanation about the "Outbound HTTPS Inspection status description"

Item	Possible returned strings	Explanation
`Outbound status description`	`Cannot get HTTPS inspection outbound status. Process may be under initialization. Please try again in a minute.`	When the HTTPS Inspection daemon **wstlsd** starts, it is necessary to wait for one minute or less, until you can get the actual status.
	`Outbound HTTPS inspection works with HSM`	All these conditions were met: 1. The value of the **:enabled()** attribute is set to **"yes"** in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group. 2. Security Gateway / Cluster Member / Security Group connected to the HSM Server.
	`Outbound HTTPS inspection works without HSM`	The value of the **:enabled()** attribute is set to **"no"** in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group, or this file does **not** exist.

Item	Possible returned strings	Explanation
	`Outbound HTTPS inspection is off due to HSM error: <Error Message>`	All these conditions were met: 1. The value of the **:enabled()** attribute is set to **"yes"** in the `$FWDIR/conf/hsm_configuration.C` file on the Security Gateway / Cluster Member / Security Group. 2. An error occurred. Possible error messages are: ■ `HSM configuration file is corrupted` ■ `Loading HSM library failed` ■ `There is no trust or no connectivity with HSM server` ■ `Login to HSM partition failed` ■ `Error importing CA certificate from HSM server` ■ `Error generating key pair on HSM server` **Important** - In this case, outbound HTTPS Inspection does **not** work, and HTTPS traffic does **not** pass through.

Note - The conditions for the returned strings are calculated on the Security Gateway / Cluster Member / Security Group during the start of the HTTPS Inspection daemon `wstlsd`, or during policy installation. For example, you can get "`HSM enabled (Enabled/Disabled) = Enabled`" and "`Outbound status description = Outbound HTTPS inspection works without HSM`", because when the `wstlsd` daemon started, or during last policy installation, the HSM configuration was disabled.

ISP Redundancy on a Security Gateway / Security Group

In This Section:

Important:

- Scalable Platforms support ISP Redundancy only on data interfaces (Known Limitation MBS-13348).
- Management interfaces and other internal control interfaces (for example, CIN) are not supported.

Note - For information about ISP Redundancy on a Cluster, see the *R82 ClusterXL Administration Guide* > Chapter *Advanced Features and Procedures* > Section *ISP Redundancy on a Cluster*.

Introduction

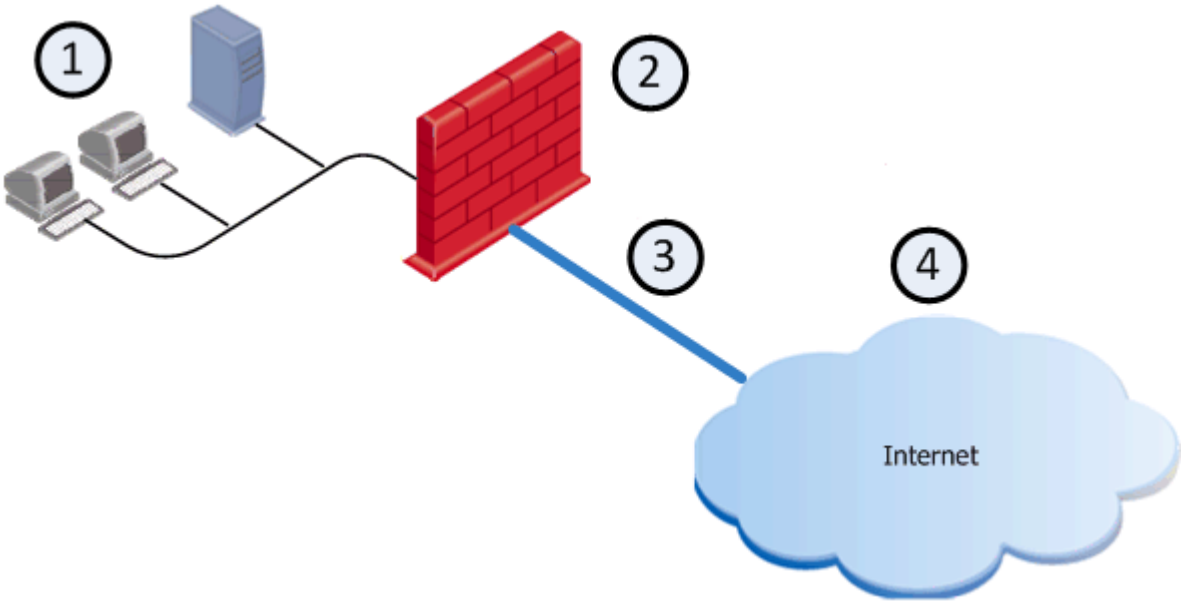
ISP Redundancy connects a Security Gateway / Scalable Platform Security Group to the Internet through redundant Internet Service Provider (ISP) links.

ISP Redundancy monitors the ISP links and chooses the best current link.

Notes:

- ISP Redundancy requires a minimum of two external interfaces and supports a maximum of ten interfaces.
  To configure more than two ISP links, the Management Server and the Security Gateway / Scalable Platform Security Group must run the version R81.10 and higher.
- ISP Redundancy is intended to traffic that originates on your internal networks and goes to the Internet.

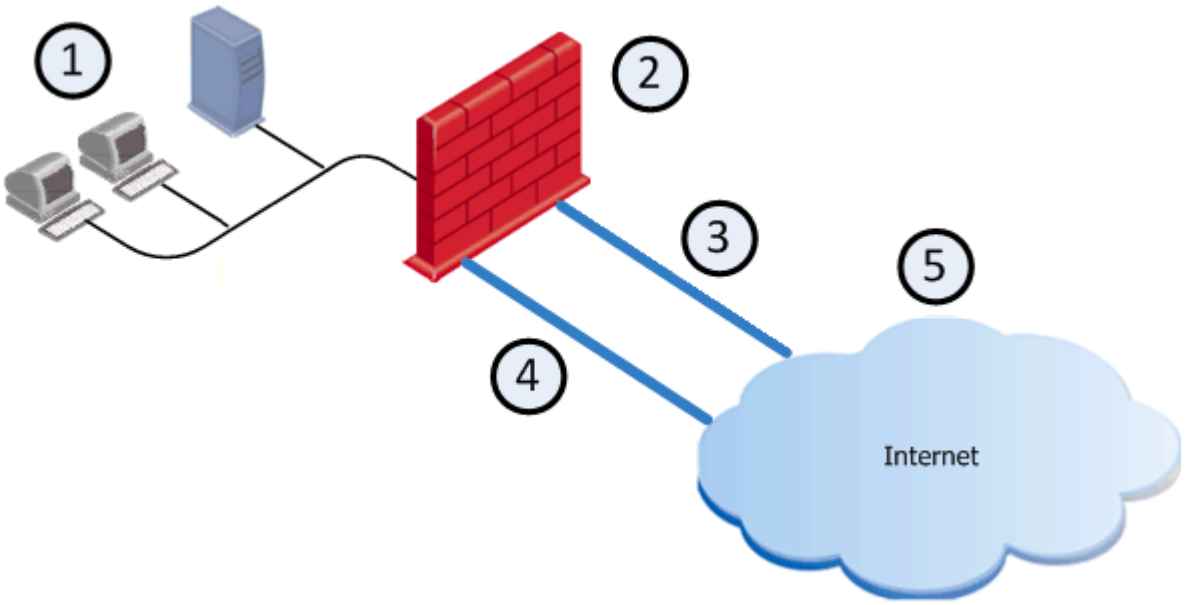
Example of a typical deployment with a single ISP link



Item	Description
1	Internal network
2	Security Gateway or Scalable Platform Security Group
3	ISP
4	Internet

Example of a typical deployment with two dedicated physical interfaces for two ISP links

Best Practice - We recommend this deployment, because it is simpler than deployment with one dedicated physical interface.



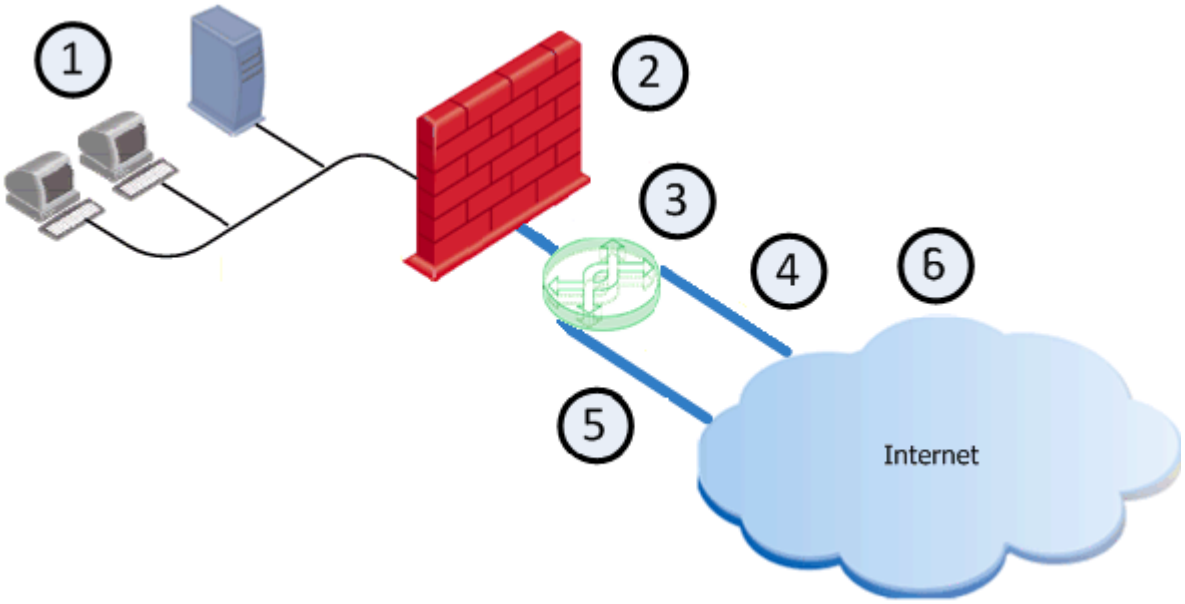
Item	Description
1	Internal network
2	Security Gateway or Scalable Platform Security Group
3	ISP A
4	ISP B
5	Internet

Example of a typical deployment with one dedicated physical interface for two ISP links

If only one external interface is available on the Security Gateway / Scalable Platform Security Group, you can configure two subnets on the same external interface.

(See the *R82 Gaia Administration Guide* > Chapter *Network Management* > Section *Network Interfaces* > Section *Aliases*.)

The two ISP links are then connected to the same Security Gateway / Scalable Platform Security Group interface, but to different next hop routers, usually through a switch.



Item	Description
1	Internal network
2	Security Gateway or Scalable Platform Security Group
3	Switch
4	ISP A
5	ISP B
6	Internet

ISP Redundancy Modes

ISP Redundancy configuration modes control the behavior of outgoing connections from internal clients to the Internet:

Mode	Description
Load Sharing	Uses all links to distribute the load of connections. The incoming connections are alternated. You can configure best relative loads for the links (set a faster link to handle more load). New connections are randomly assigned to a link. If one link fails, the other link takes the load. In this mode, incoming connections can reach the application servers through any of ISP links because the Security Gateway / Scalable Platform Security Group can answer DNS requests for the IP address of internal servers with IP addresses from both ISPs by alternating their order.
Primary/Backup	Uses one link for connections. It switches to the Backup link, if the Primary link fails. When the Primary link is restored, new connections are assigned to it. Existing connections continue on the Backup link until they are complete. In this mode, incoming connections (from the Internet to application servers in the DMZ or internal networks) also benefit, because the Security Gateway / Scalable Platform Security Group returns packets using the same ISP Link, through which the connection was initiated.

Best Practice:

- If all ISP links are basically the same, use the Load Sharing mode to ensure that you are making the best use of all ISP links.
- You may prefer to use one of your ISP links that is more cost-effective in terms of price and reliability.
  In that case, use the Primary/Backup mode and set the more cost-effective ISP as the Primary ISP link.

Outgoing Connections

Mode	Description
Load Sharing	Outgoing traffic that exits the Security Gateway / Scalable Platform Security Group on its way to the Internet is distributed between the ISP Links. You can set a relative weight for how much you want each of the ISP Links to be used. For example, if one link is faster, it can be configured to route more traffic across that ISP link than the other links.
Primary/Backup	Outgoing traffic uses an active primary link. Hide NAT is used to change the source address of outgoing packets to the address of the interface, through which the packet leaves the Security Gateway / Scalable Platform Security Group. This allows return packets to be automatically routed through the same ISP link, because their destination address is the address of the correct link. Administrator configures the Hide NAT settings.

Incoming Connections

For external users to make incoming connections, the administrator must:

1. Give each application server one routable IP address for each ISP.
2. Configure Static NAT to translate the routable addresses to the real server address.

If the servers handle different services (for example, HTTP and FTP), you can use NAT to employ only routable IP addresses for all the publicly available servers.

External clients use one of the assigned IP addresses. In order to connect, the clients must be able to resolve the DNS name of the server to the correct IP address.

Example

Note - The example below is for two ISP links. The subnets **172.16.0.0/24** and **192.168.0.0/24** represent public routable IP addresses.

The Web server **www.example.com** is assigned an IP address from each ISP:

- 192.168.1.2 from ISP A
- 172.16.2.2 from ISP B

If the **ISP Link A** is down, then IP address **192.168.1.2** becomes unavailable, and the clients must be able to resolve the URL **www.example.com** to the IP address **172.16.2.2**.

An incoming connection is established, based on this example, in the following sequence:

1. When an external client on the Internet contacts **www.example.com**, the client sends a DNS query for the IP address of this URL.

   The DNS query reaches the Security Gateway / Scalable Platform Security Group.

   The Security Gateway / Security Group has a built-in mini-DNS server that can be configured to intercept DNS queries (of Type A) for servers in its domain.
2. A DNS query arriving at an interface that belongs to one of the ISP links, is intercepted by the Security Gateway / Security Group.
3. If the Security Gateway / Security Group recognizes the name of the host, it sends one of the following replies:
   - In ISP Redundancy **Primary/Backup** mode, the Security Gateway / Security Group replies only with the IP addresses associated with the Primary ISP link, as long as the Primary ISP link is active.
   - In ISP Redundancy **Load Sharing** mode, the Security Gateway / Security Group replies with two IP addresses, alternating their order.

4. If the Security Gateway / Security Group is unable to handle DNS requests (for example, it may not recognize the host name), it passes the DNS query to its original destination or the DNS server of the domain **example.com**.
5. When the external client receives the reply to its DNS query, it opens a connection. Once the packets reach the Security Gateway / Security Group, the Security Gateway / Security Group uses Static NAT to translate the destination IP address **192.168.1.2** or **172.16.2.2** to the real server IP address **10.0.0.2**.
6. The Security Gateway / Security Group routes the reply packets from the server to the client through the same ISP link that was used to initiate the connection.

Configuring ISP Redundancy on a Security Gateway

Important:

- ISP Redundancy requires a minimum of two interfaces.
- If you configure a Cloning Group and ISP Redundancy on a Security Gateway / Security Group, then you must enable the Gaia feature **"Kernel Routes"**. See the *R82 Gaia Advanced Routing Administration Guide*.

1. Connect with SmartConsole to the Security Management Server or Domain Management Server that manages this Security Gateway / Scalable Platform Security Group.
2. From the left navigation panel, click **Gateways & Servers**.
3. Open the applicable Security Gateway / Security Group object.
4. Click **Other** > **ISP Redundancy**.
5. Select **Support ISP Redundancy**.
6. Select the redundancy mode:
   - **Load Sharing** - traffic is sent in a round-robin method over all configured ISP Links.
   - **Primary/Backup** - traffic is sent only over one ISP Link until it goes down (the order of arranged ISP Links determines in which order to use them).
7. Configure the ISP Links (at least two, at maximum ten).

   To configure more than two ISP links, the Management Server and a Security Gateway / Scalable Platform Security Group must run the version R81.10 and higher.

   Procedure

   Make sure you have the ISP data - the speed of the link and next hop IP address.

- If the Security Gateway / Security Group object has at least two interfaces with the Topology "**External**" in the **Network Management** page, you can configure the ISP links automatically.

  Configuring ISP links automatically

  a. Click **Other** > **ISP Redundancy**.

  b. Click **Set initial configuration**.

     The ISP Links are added automatically.

  c. If you selected the **Primary/Backup** mode, make sure the Primary interface is first in the list.

     Use the arrows on the right to change the order.

  d. Click **OK**.

- If the Security Gateway / Security Group object has only one interface with the Topology "**External**" in the **Network Management** page, you must configure the ISP links manually.

  Note - We recommend to configure the Topology "**External**" for each interface the Security Gateway / Scalable Platform Security Group needs to use for ISP Redundancy.

  Configuring ISP links manually

  a. Click **Other** > **ISP Redundancy**.

  b. In the **IPS Links** section, click **Add**.

     The **ISP Link** window opens.

  c. Click the **General** tab.

  d. In the **Name** field, enter a name for this ISP link.

     The name you enter here is used in the ISP Redundancy commands (see *"Controlling ISP Redundancy from CLI" on page 189*).

  e. In the **Interface** field, select the correct interface of the Security Gateway / Security Group for this ISP link.

     If one of the ISP links is the connection to a backup ISP, configure the ISP Redundancy Script (see *"Controlling ISP Redundancy from CLI" on page 189*).

f. In the **Next Hop IP Address** field:

- If the Security Gateway / Security Group object has at least two interfaces with the Topology "**External**" in the **Network Management** page, leave this field empty and click **Get from routing table**. The next hop is the default gateway.
- If the Security Gateway / Security Group object has only one interface with the Topology "**External**" in the **Network Management** page, enter the corrent IP address of the next hop.

g. If earlier you selected the **Load Sharing** mode, then in the **Weight** field, enter the applicable value.

For equal traffic distribution between the IPS links, enter the applicable ratio in each ISP link (100% / Number of ISP Links):

- For two ISP links, enter **50** in each.
- For three ISP links, enter **33** in each.
- For four ISP links, enter **25** in each.
- and so on.

If one ISP link is faster, increase this value and decrease it for the other ISP links, so that the sum of these values is always equal 100.

h. **Optional:** Click the **Advanced** tab and configure hosts to be monitored, to make sure the link is working.

Add the applicable host objects in the **Selected hosts** section.

i. Click **OK**.

8. Configure the Security Gateway / Security Group to be the DNS server.

Procedure

The Security Gateway / Security Group, or a DNS server behind it, must respond to DNS queries.

It resolves IP addresses of servers in the DMZ (or another internal network).

Get a public IP address from each ISP. If public IP addresses are not available, register the domain to make the DNS server accessible from the Internet.

The Security Gateway / Security Group intercepts DNS queries "Type A" for the web servers in its domain that come from external hosts.

- If the Security Gateway / Security Group recognizes the external host, it replies:
  - In ISP Redundancy **Load Sharing** mode, the Security Gateway / Security Group replies with IP addresses of all ISP links, alternating their order.
  - In ISP Redundancy **Primary/Backup** mode, the Security Gateway / Security Group replies with the IP addresses of the active ISP link.
- If the Security Gateway / Security Group does not recognize the host, it passes the DNS query on to the original destination, or to the domain DNS server.

To enable the DNS server:

a. Click **Other** > **ISP Redundancy**.

b. Select **Enable DNS Proxy**.

c. Click **Configure**.

d. Add your DMZ or Web servers.

Configure each server with a public IP address from each ISP.

e. In the **DNS TTL**, enter a number of seconds.

This sets a Time To Live for each DNS reply.

DNS servers in the Internet cannot cache your DNS data in the reply for longer than the TTL.

f. Click **OK**.

g. Configure Static NAT to translate the public IP addresses to the real server's IP address.

External clients use one of the configured IP addresses.

Note - If the servers use different services (for example, HTTP and FTP), you can use NAT for only the configured public IP addresses.

h. Define an Access Control Policy rule:

Name	Source	Destination	VPN	Services & Applications	Action	Track	Install On
DNS Proxy	Applicable sources	Applicable DNS Servers	Any	domain_udp	Accept	None	Policy Targets

To register the domain and get IP addresses:

a. Register your domain with each ISP.

b. Tell the ISP the configured IP addresses of the DNS server that respond to DNS queries for the domain.

c. For each server in the DMZ, get a public IP address from each ISP.

d. In SmartConsole, click **Menu** > **Global properties**.

e. From the left tree, click **NAT - Network Address Translation**.

f. In the **Manual NAT rules** section, select **Translate destination on client side**.

g. Click **OK**.

9. Configure the Access Control Policy for ISP Redundancy.

Procedure

The Access Control Policy must allow connections through the ISP links, with Automatic Hide NAT on network objects that start outgoing connections.

a. In the properties of the object for an internal network, select **NAT** > **Add Automatic Address Translation Rules**.

b. Select **Hide behind the gateway**.

c. Click **OK**.

d. Define rules for publicly reachable servers (Web servers, DNS servers, DMZ servers).

- If you have one public IP address from each ISP for the Security Gateway / Security Group, define Static NAT.

  Allow specific services for specific servers.

  For example, configure NAT rules, so that incoming HTTP connections from your ISPs reach a Web server, and DNS connections from your ISPs reach the DNS server.

  Example: Manual Static Rules for a Web Server and a DNS Server

Original Source	Original Destination	Original Services	Translated Source	Translated Destination	Translated Services	Install On	Comment
Any	Host object with IP address of Web Server	http	= Original	S 50.50.50.2	= Original	Policy Targets	Incoming Web - ISP A
Any	Host object with IP address of Web Server	http	= Original	S 60.60.60.2	= Original	Policy Targets	Incoming Web - ISP B
Any	Host object with IP address of DNS Server	domain_udp	= Original	S 50.50.50.3	= Original	Policy Targets	Incoming DNS - ISP A
Any	Host object with IP address of DNS Server	domain_udp	= Original	S 60.60.60.3	= Original	Policy Targets	Incoming DNS - ISP B

- If you have a public IP address from each ISP for each publicly reachable server (in addition to the Security Gateway / Security Group), configure the applicable NAT rules:

  i. Give each server a private IP address.

  ii. Use the public IP addresses in the **Original Destination**.

  iii. Use the private IP address in the **Translated Destination**.

  iv. Select **Any** as the **Original Service**.

Note - If you use Manual NAT, then automatic ARP does not work for the IP addresses behind NAT. You must configure the `local.arp` file as described in sk30197.

10. Install the Access Control Policy on this Security Gateway / Security Group object.

ISP Redundancy and VPN

Note - ISP Redundancy settings override the **VPN Link Selection** settings.

When ISP Redundancy is enabled, VPN encrypted connections survive a failure of an ISP link.

The settings in the ISP Redundancy page override settings in the **IPsec VPN > Link Selection** page.

Configuring ISP Redundancy for VPN with a Check Point peer

Step	Instructions
1	Connect with SmartConsole to the Security Management Server or Domain Management Server that manages this Security Gateway / Scalable Platform Security Group.
2	From the left navigation panel, click **Gateways & Servers**.
3	Open the Security Gateway / Security Group object.
4	In the left navigation tree, go to **Other** > **ISP Redundancy**.
5	Select **Apply settings to VPN traffic**.
6	In the left navigation tree, go to **IPsec VPN** > **Link Selection**.
7	Make sure that **Use ongoing probing. Link redundancy mode** shows the mode of the ISP Redundancy: **High Availability** (for Primary/Backup) or **Load Sharing**. The **VPN Link Selection** now only probes the ISP configured in ISP Redundancy.

Configuring ISP Redundancy for VPN with a third-party peer

If the VPN peer is **not** a Check Point Security Gateway, the VPN may fail, or the third-party device may continue to encrypt traffic to a failed ISP link.

- Make sure the third-party VPN peer recognizes encrypted traffic from the secondary ISP link as coming from the Check Point cluster.
- Change the configuration of ISP Redundancy to **not** use these Check Point technologies:

- **Use Probing** - Makes sure that **Link Selection** uses another option.
- The options **Load Sharing**, **Service Based Link Selection**, and **Route based probing** work only on Check Point Security Gateways/ Clusters / Security Groups.

  If used, the Security Gateway / Cluster Members / Security Group uses one link to connect to the third-party VPN peer.

  The link with the highest prefix length and lowest metric is used.

Controlling ISP Redundancy from CLI

You can control the ISP Redundancy behavior from CLI.

Force ISP Link State

Use the "`fw isp_link`" command to force the ISP link state to Up or Down.

Use this to test installation and deployment, or to force the Security Gateway / Scalable Platform Security Group to recognize the true link state if it cannot (the ISP link is down but the gateway sees it as up).

- You can run this command on the Security Gateway:

```
fw isp_link <Name of ISP Link in SmartConsole> {up | down}
```

- You can run this command on the Scalable Platform Security Group:

```
g_fw isp_link <Name of ISP Link in SmartConsole> {up | down}
```

- You can run this command on the Security Management Server:

```
fw isp_link <Name of Security Gateway Object> <Name of ISP
Link in SmartConsole> {up | down}
```

For more information, see the *R82 CLI Reference Guide* > Chapter *Security Gateway Commands* - Section *fw* - Section *fw isp_link*.

The ISP Redundancy Script

When the Security Gateway starts, or an ISP link state changes, the `$FWDIR/bin/cpisp_update` script runs on the Security Gateway.

This script changes the default route of the Security Gateway.

Warning - We do **not** recommend that you make any changes to this script.

Mirror and Decrypt

The Mirror and Decrypt feature performs these actions on your Security Gateway / Cluster / Scalable Platform Security Group:

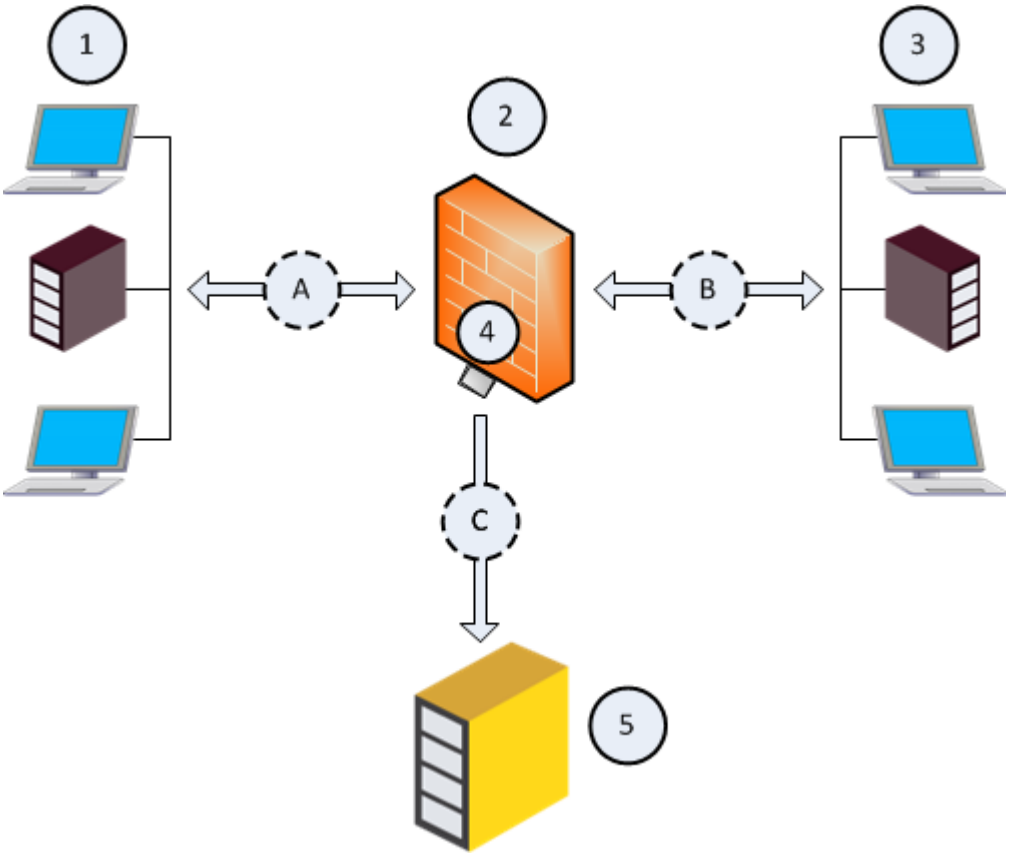
Action	Description
Only mirror of all traffic	Your Security Gateway / Cluster / Security Group clones all traffic (including HTTPS without decryption) that passes through it, and sends it out of the designated physical interface.
Mirror and Decrypt of HTTPS traffic	Your Security Gateway / Cluster / Security Group clones all HTTPS traffic that passes through it, decrypts it, and sends it in clear-text out of the designated physical interface. **Note** - If you wish to decrypt the HTTPS traffic, you must enable and configure the HTTPS Inspection on your Security Gateway / Cluster / Security Group.

You can add a third-party Recorder or Packet-Broker in your environment and forward to it the traffic that passes through your Security Gateway / Cluster / Security Group.

This Recorder or Packet-Broker must work in monitor (promiscuous) mode to accept the decrypted and mirrored traffic from your Security Gateway / Cluster / Security Group.

Security Gateway / Cluster / Security Group works only with *one* Recorder, which is directly connected to a designated physical network interface (NIC) on the Check Point Security Gateway / Cluster / Security Group.

Example Topology and Traffic Flow:



Item	Description
1	First network that sends and receives traffic through the Security Gateway **(2)**.
2	Security Gateway, through which networks **(1)** and **(3)** send and receive their traffic.
3	Second network that sends and receives traffic through the Security Gateway **(2)**.
4	Designated physical interface on the Security Gateway **(2)**.
5	Recorder, or Packet-Broker that works in a monitor (promiscuous) mode.
A	Traffic flow between the first network **(1)** and the Security Gateway **(2)**.
B	Traffic flow between the second network **(3)** and the Security Gateway **(2)**.
C	Flow of the decrypted and mirrored traffic from the Security Gateway **(2)** to the Recorder, or Packet-Broker **(5)**.

Source MAC address of the decrypted and mirrored packets

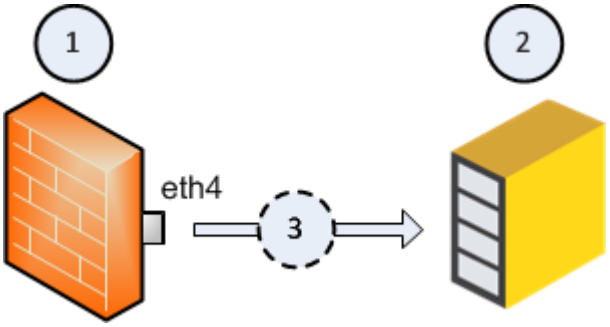
Traffic	Source MAC address of the decrypted and mirrored packets the Security Gateway / Cluster / Security Group sends
Mirror only of all traffic	MAC address of the designated physical interface.
Mirror and Decrypt of HTTPS traffic	00:00:00:00:00:00

Mirror and Decrypt Requirements

Item	Description
1	Designated network interface for Mirror and Decrypt: a. Select a designated physical interface on your Security Gateway / each Cluster Member / Scalable Platform Security Group. **Important:** ▪ On cluster members, you must select an interface with the *same name* (for example, `eth3` on each cluster member). ▪ Select an interface with the largest available throughput (for example, 10G, 40G), because this interface passes the combined traffic from all other interfaces. b. Assign a dummy IP address to the designated interface. **Important** - This IP address cannot collide with other IP addresses used in your environment. This IP address cannot belong to subnets used in your environment. Make sure to configure the correct subnet mask. After you enable traffic mirroring on this interface in SmartConsole, all other traffic that is routed to this interface is dropped. c. On cluster members, you must configure this designated physical interface in the `$FWDIR/conf/discntd.if` file. **Note** - This prevents the interfaces that are not used from sending Cluster Control Protocol (CCP) packets that can overwhelm the Mirror and Decrypt recorders.
2	Maximum Transmission Unit (MTU) on the Mirror and Decrypt designated physical interface: ▪ MTU value has to be 1500 (default), or at least the maximum MTU value from other interfaces on the Security Gateway / Cluster Member / Security Group.
3	HTTPS Inspection for decrypting the HTTPS traffic: ▪ You must enable the HTTPS Inspection in SmartConsole in the object of the Security Gateway / Cluster / Security Group / VSX Virtual System. ▪ You must configure the HTTPS Inspection Rule Base.
4	Access Rules for traffic you wish to Mirror and Decrypt: ▪ You must create special rules in the Access Control Policy for the traffic you wish to mirror and decrypt.

Configuring Mirror and Decrypt in Gateway mode

Example topology:



Item	Description
1	Security Gateway, through which your networks send and receive their traffic.
2	Recorder, or Packet-Broker that works in a monitor (promiscuous) mode.
3	Flow of the decrypted and mirrored traffic from the Security Gateway (**1**) to the Recorder, or Packet-Broker (**2**).
eth4	Designated physical interface on the Security Gateway (**1**).

Workflow for configuring Mirror and Decrypt in Gateway mode:

Step	Instructions
1	Read and follow the *"Mirror and Decrypt Requirements" on page 193*.
2	Prepare the Security Gateway / each Cluster Member / Scalable Platform Security Group. See *"Preparing the Security Gateway, each Cluster Member, Security Group" on page 195*.
3	Configure the Mirror and Decrypt in the Security Gateway / Cluster / Scalable Platform Security Group object in SmartConsole. See *"Configuring Mirror and Decrypt in SmartConsole for Gateway Mode" on page 197*.

Preparing the Security Gateway, each Cluster Member, Security Group

Step	Instructions
1	Select a designated physical interface for Mirror and Decrypt on the Security Gateway / each Cluster Member / Scalable Platform Security Group. **Important** - On cluster members, you must select an interface with the *same name* (for example, `eth3` on each cluster member).
2	Configure a dummy IP address on this designated physical interface. **Important** - This IP address cannot collide with other IP addresses used in your environment. This IP address cannot belong to subnets used in your environment. Make sure to configure the correct subnet mask. After you enable traffic mirroring on this interface in SmartConsole, all other traffic that is routed to this interface is dropped. For instructions about configuring an IP address on a physical interface, see the *R82 Gaia Administration Guide* - Chapter *Network Management* - Section *Network Interfaces* - Section *Physical Interfaces*.
3	Configure the required Maximum Transmission Unit (MTU) on this designated physical interface. MTU has to be the default 1500, or at least the maximum MTU value from other interfaces on the Security Gateway / Cluster Member / Security Group. For instructions about configuring an MTU on a physical interface, see the *R82 Gaia Administration Guide* - Chapter *Network Management* - Section *Network Interfaces* - Section *Physical Interfaces*.

Step	Instructions

4	**Important** - On cluster members, you must configure this designated physical interface in the `$FWDIR/conf/discntd.if` file on *each* Cluster Member.
	a. Connect to the command line on each Cluster Member.
	b. Log in to the Expert mode.
	c. Create the `$FWDIR/conf/discntd.if` file:
	`touch $FWDIR/conf/discntd.if`
	d. Edit the `$FWDIR/conf/discntd.if` file in the Vi editor:
	`vi $FWDIR/conf/discntd.if`
	e. Write the name of the designated physical interface. After the interface name, you must press Enter.
	Note - Comments are not allowed in this file.
	f. Save the changes in the file and exit the editor.
	Note - To apply the configuration from the file and make it persistent, install an Access Control Policy on the cluster object. You install the Access Control Policy later, after the required configuration steps in the SmartConsole.

Configuring Mirror and Decrypt in SmartConsole for Gateway Mode

Workflow for Security Gateway / Cluster / Scalable Platform Security Group in Gateway mode:

1. Enable the HTTPS Inspection in the object of your Security Gateway / Cluster (for decrypting the HTTPS traffic).

   Procedure

Step	Instructions
a	Connect with SmartConsole to the Management Server.
b	From the left navigation panel, click **Gateways & Servers**.
c	Open the Security Gateway / Cluster object.
d	From the navigation tree, click **HTTPS Inspection**.
e	View and export the certificate.
f	Check **Enable HTTPS Inspection**.
g	Click **OK**.

2. Configure the HTTPS Inspection Rule Base (for decrypting the HTTPS traffic).

   Procedure

Step	Instructions
a	From the left navigation panel, click **Security Policies**.
b	From the left tree, click **HTTPS Inspection**.
d	Configure the HTTPS Inspection Rule Base. See *R82 Security Management Administration Guide*. For more settings, in the **HTTPS Tools** section, click **Additional Settings**.
e	Publish the SmartConsole session.

3. Activate the Mirror and Decrypt in the object of your Security Gateway / Cluster.

Procedure

Step	Instructions
a	From the left navigation panel, click **Gateways & Servers**.
b	Open the Security Gateway / Cluster object.
c	From the left tree, click **Network Management**.
d	From the top toolbar, click **Get Interfaces Without Topology**.
e	Make sure the interface designated for Mirror and Decrypt is listed with the dummy IP address.
f	Select the interface designated for Mirror and Decrypt and click **Edit**.
g	From the navigation tree, click **General**.
h	In the **General** section: In the **Network Type** field, select **Private**. **Note** - This field shows only in **Cluster** objects.
i	In the **Topology** section: Click **Modify**. The **Topology Settings** window opens.
j	In the **Leads To** section: i. Select **Override**. ii. Select **This Network (Internal)**. iii. Select **Network defined by the interface IP and Net Mask**.
k	In the **Security Zone** section: i. Select **User defined**. ii. Do not check the **Specify Security Zone**.
l	In the **Anti-Spoofing** section: Clear the **Perform Anti-Spoofing based on interface topology**.
m	Click **OK** to save the changes and close the **Topology Settings** window.
n	From the navigation tree of the Security Gateway / Cluster object: Click the **[+]** near the **Other** and click **Mirror and Decrypt**.

Step	Instructions
o	Check **Mirror gateway traffic to interface**. The **Mirror and Decrypt - User Disclaimer** window opens. i. Read the text carefully. ii. Check **I agree to the terms and conditions**. iii. Click **OK** to accept and close the disclaimer.
p	In the **Mirror gateway traffic to interface** field, select the designated physical interface.
q	Click **OK** to save the changes and close the Security Gateway / Cluster properties window.

4. Configure the Mirror and Decrypt rules in the Access Control Policy for the traffic you wish to mirror and decrypt.

   Procedure

   Best Practice - We recommend you to configure a new separate Access Control Layer to contain Mirror and Decrypt rules. Alternatively, you can configure the Mirror and Decrypt rules in the regular Rule Base.

   Important - When you configure the Mirror and Decrypt rules, these limitations apply:
   - In the Mirror and Decrypt rules, you must **not** select Content criteria, such as Application, URL Filtering, Service matched by IP Protocol, Content Awareness.
   - Above the Mirror and Decrypt rules, you must **not** configure other rules that contain Content criteria, such as Application, URL Filtering, Service matched by IP Protocol, Content Awareness.
   - You must configure rules that contain an excluded source or an excluded destination above the Mirror and Decrypt rules.
     The **Name** column of these rules cannot contain these strings: **<M&D>**, **<M&d>**, **<m&D>**, or **<m&d>**.

   The procedure below describes how to configure the Mirror and Decrypt rules in a separate Access Control Layer in SmartConsole:

Step	Instructions
a	From the left navigation panel, click **Security Policies**.
b	Create a new Access Control Layer in the Access Control Policy.
c	In SmartConsole top left corner, click **Menu** > **Manage policies and layers**.

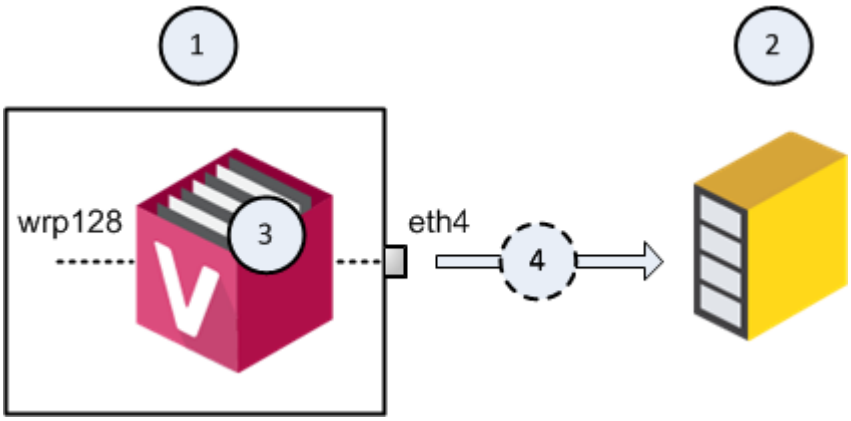
Step	Instructions
d	Select the existing policy and click **Edit** (the pencil icon). Alternatively, create a new policy.
e	From the navigation tree of the **Policy** window, click **General**.
f	In the **Policy Types** section, make sure you select **only** the **Access Control**.
g	In **Access Control** section, click on the **+** (plus) icon. A pop up window opens.
h	In the top right corner of this pop up window, click **New Layer**. The **Layer Editor** window opens.
i	From the navigation tree of the **Layer Editor** window, click **General**.
j	In the **Blades** section, make sure you select **only** the **Firewall**.
k	On other pages of the **Layer Editor** window, configure additional applicable settings. Click **OK**.
l	In the **Access Control** section, you see the **Network** Layer and the new **Access Control** Layer.
m	Click **OK** to save the changes and close the **Policy** window.
n	In SmartConsole, at the top, click the tab of the applicable policy.
o	In the **Access Control** section, click the new Access Control Layer. In the default rule, you must change the `Action` column from `Drop` to `Accept` to **not** affect the policy enforcement: ■ **Name** - Your text **Important** - You **cannot** use these strings: **<M&D>**, **<M&d>**, **<m&D>**, or **<m&d>** ■ **Source** - ***Any** ■ **Destination** - ***Any** ■ **VPN** - ***Any** ■ **Services & Applications** - ***Any** ■ **Action** - Must contain **Accept** ■ **Track** - **None** ■ **Install On** - ***Policy Targets**

Step	Instructions
p	Above the existing Cleanup rule, add the applicable rules for the traffic you wish to Mirror and Decrypt. You must configure the Mirror and Decrypt rules as follows: ■ **Name** - Must contain one of these strings (the angle brackets **<>** are mandatory): • **<M&D>** • **<M&d>** • **<m&D>** • **<m&d>** ■ **Source** - Select the applicable objects ■ **Destination** - Select the applicable objects ■ **VPN** - Must leave the default `*Any` ■ **Services & Applications** - Select the applicable services (to decrypt the HTTPS traffic, select the applicable HTTP, HTTPS, or Proxy services) ■ **Action** - Must contain **Accept** ■ **Track** - Select the applicable option (**None**, **Log**, or **Alert**) ■ **Install On** - Must contain one of these objects: • ***Policy Targets** (this is the default) • The Security Gateway, or Cluster object, whose version is **R80.20** or higher
	Important: ■ In the Mirror and Decrypt rules, you must **not** select Content criteria, such as Application, URL Filtering, Service matched by IP Protocol, Content Awareness. ■ Above the Mirror and Decrypt rules, you must **not** configure other rules that contain Content criteria, such as Application, URL Filtering, Service matched by IP Protocol, Content Awareness. ■ You must configure rules that contain an excluded source or an excluded destination above the Mirror and Decrypt rules. The **Name** column of these rules cannot contain these strings: **<M&D>**, **<M&d>**, **<m&D>**, or **<m&d>**.
q	Publish the SmartConsole session.
r	Install the Access Control Policy.

Step	Instructions
s	If in a Mirror and Decrypt rule you set the **Track** to **Log**, then you can filter the logs for this rule by the **Access Rule Name**, which contains the configured string: **<M&D>**, **<M&d>**, **<m&D>**, or **<m&d>**.

Configuring Mirror and Decrypt in VSX mode

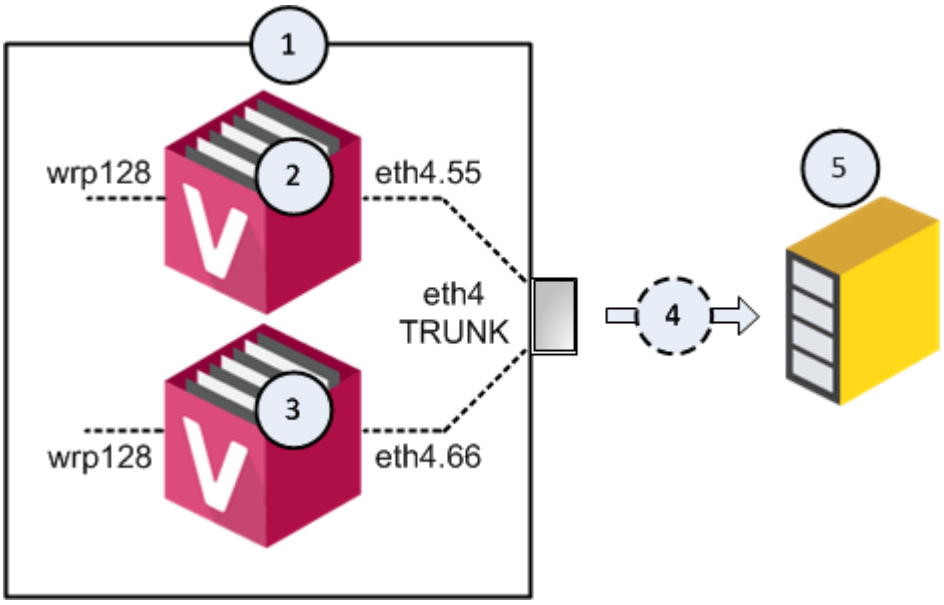
Example topology for one Virtual System:



Item	Description
1	VSX Gateway (Scalable Platform Security Group).
2	Recorder, or Packet-Broker that works in a monitor (promiscuous) mode.
3	Virtual System, through which your networks send and receive their traffic.
4	Flow of the decrypted and mirrored traffic from the VSX Gateway (Security Group) **(1)** to the Recorder, or Packet-Broker (**2**).
eth4	Designated physical interface on the VSX Gateway (Security Group) (**1**). Virtual System (**3**) connects directly to this physical interface.
wrp128	One of the virtual interfaces on the Virtual System (**3**).

Example topology for several Virtual Systems:

Note - This topology requires you to configure a VLAN Trunk on the Recorder or Packet-Broker. The VLAN Trunk on the Recorder or Packet-Broker must accept all VLAN IDs that you configure in the objects of the applicable Virtual Systems in SmartConsole.



Item	Description
1	VSX Gateway.
2	First Virtual System, through which your networks send and receive their traffic.
3	Second Virtual System, through which your networks send and receive their traffic.
4	Flow of the decrypted and mirrored traffic from the VSX Gateway (Security Group) (**1**) to the Recorder, or Packet-Broker (**5**).
5	Recorder, or Packet-Broker.
eth4	Designated physical interface on the VSX Gateway (Security Group) (**1**). This interface is configured as VLAN Trunk in the VSX Gateway object in SmartConsole. Virtual Systems (**2** and **3**) connect to this VLAN Trunk interface with VLAN interfaces.
eth4.55	VLAN interface on the first Virtual System (**2**).
eth4.66	VLAN interface on the second Virtual System (**3**).

Item	Description
wrp128	One of the virtual interfaces on the Virtual Systems (**2** and **3**).

Important - It is **not** supported to change the designated physical interface with the "`vsx_util change_interfaces`" command.
For information about this command, see the *R82 VSX Administration Guide*.

Workflow for configuring Mirror and Decrypt in VSX mode:

Step	Instructions
1	Read and follow the *"Mirror and Decrypt Requirements" on page 193*.
2	Prepare the VSX Gateway / *each* VSX Cluster Member / Scalable Platform Security Group. See *"Preparing the VSX Gateway, each VSX Cluster Member, Security Group" on page 206*.
3	Configure the Mirror and Decrypt in the Virtual System object in SmartConsole. See: ■ *"Configuring Mirror and Decrypt in SmartConsole for One Virtual System" on page 208*. ■ *"Configuring Mirror and Decrypt in SmartConsole for Several Virtual Systems" on page 214*.

Preparing the VSX Gateway, each VSX Cluster Member, Security Group

Item	Description
1	Select a designated physical interface for Mirror and Decrypt on the VSX Gateway / *each* VSX Cluster Member / Scalable Platform Security Group. **Important** - On VSX Cluster Members, you must select an interface with the *same name* (for example, `eth3` on each VSX Cluster Member).
2	Do **not** configure an IP address on this designated physical interface.
3	Configure the required Maximum Transmission Unit (MTU) on this designated physical interface. MTU has to be the default 1500, or at least the maximum MTU value from other interfaces on the VSX Gateway / VSX Cluster Member / Security Group. For instructions about configuring an MTU on a physical interface, see *R82 Gaia Administration Guide* - Chapter *Network Management* - Section *Network Interfaces* - Section *Physical Interfaces*.

Item	Description

4	**Important** - In VSX Cluster, you must configure this designated physical interface in the `$FWDIR/conf/discntd.if` file on *each* VSX Cluster Member.
	a. Connect to the command line.
	b. Log in to the Expert mode.
	c. Go to the context of the Virtual System 0:
	`vsenv 0`
	Output shows:
	`Context is set to Virtual Device <Name of VSX Gateway> (ID 0).`
	d. Create the `$FWDIR/conf/discntd.if` file:
	`touch $FWDIR/conf/discntd.if`
	e. Edit the `$FWDIR/conf/discntd.if` file in the Vi editor:
	`vi $FWDIR/conf/discntd.if`
	f. Write the name of the designated physical interface. After the interface name, you must press Enter.
	Note - Comments are not allowed in this file.
	g. Save the changes in the file and exit the Vi editor.
	Note - To apply the configuration from the file and make it persistent, install an Access Control Policy on the VSX Cluster object. You install the Access Control Policy later, after the required configuration steps in the SmartConsole.

Configuring Mirror and Decrypt in SmartConsole for One Virtual System

Workflow for one Virtual System:

1. Enable the HTTPS Inspection in the object of the Virtual System (for decrypting the HTTPS traffic).

   Procedure

Step	Instructions
a	Connect with SmartConsole to the Management Server.
b	From the left navigation panel, click **Gateways & Servers**.
c	Open the Virtual System object.
d	From the navigation tree, click **HTTPS Inspection**.
e	View and export the certificate.
f	Check **Enable HTTPS Inspection**.
g	Click **OK**.

2. Configure the HTTPS Inspection Rule Base (for decrypting the HTTPS traffic).

   Procedure

Step	Instructions
a	From the left navigation panel, click **Security Policies**.
b	From the left tree, click **HTTPS Inspection**.
d	Configure the HTTPS Inspection Rule Base. See *R82 Security Management Administration Guide*. For more settings, in the **HTTPS Tools** section, click **Additional Settings**.
e	Publish the SmartConsole session.

3. Add the designated physical interface in the object of the Virtual System.

Procedure

Step	Instructions
a	In SmartConsole, open the Virtual System object.
b	From the navigation tree, click **Topology**.
c	From the top toolbar, click **New** > **Regular**.
d	On the **General** tab: i. In the **Interface** field, select the designated physical interface. ii. In the **IPv4 Configuration** section: ▪ In the **IP Address** field, enter a dummy IP address. ▪ In the **Net Mask** field, enter the applicable net mask. **Important** - This IP address cannot collide with other IP addresses used in your environment. This IP address cannot belong to subnets used in your environment. Make sure to configure the correct subnet mask. After you enable traffic mirroring on this interface in SmartConsole, all other traffic that is routed to this interface is dropped. iii. Do not check the **Propagate route to adjacent Virtual Devices (IPv4)**. iv. In the **MTU** field, enter the applicable MTU. See *"Mirror and Decrypt Requirements" on page 193*. v. In the **Security Zone** field, leave the default **None**. vi. Click **OK**.

4. Activate the Mirror and Decrypt in the object of the Virtual System.

Procedure

Step	Instructions
a	From the left navigation panel, click **Gateways & Servers**.
b	Open the Virtual System object.
c	From the left tree, click the **[+]** near the **Other** and click **Mirror and Decrypt**.
d	Check **Mirror gateway traffic to interface**. The **Mirror and Decrypt - User Disclaimer** window opens. i. Read the text carefully. ii. Check **I agree to the terms and conditions**. iii. Click **OK** to accept and close the disclaimer.

Step	Instructions
e	In the **Mirror gateway traffic to interface** field, select the designated physical interface.
f	Click **OK** to save the changes and close the Virtual System properties window.

5. Configure the Mirror and Decrypt rules in the Access Control Policy for the traffic you wish to mirror and decrypt.

   Procedure

   Best Practice - We recommend you to configure a new separate Access Control Layer to contain Mirror and Decrypt rules. Alternatively, you can configure the Mirror and Decrypt rules in the regular Rule Base.

   Important - When you configure the Mirror and Decrypt rules, these limitations apply:
   - In the Mirror and Decrypt rules, you must **not** select Content criteria, such as Application, URL Filtering, Service matched by IP Protocol, Content Awareness.
   - Above the Mirror and Decrypt rules, you must **not** configure other rules that contain Content criteria, such as Application, URL Filtering, Service matched by IP Protocol, Content Awareness.
   - You must configure rules that contain an excluded source or an excluded destination above the Mirror and Decrypt rules.
     The **Name** column of these rules cannot contain these strings: **<M&D>**, **<M&d>**, **<m&D>**, or **<m&d>**.

   The procedure below describes how to configure the Mirror and Decrypt rules in a separate Access Control Layer in SmartConsole:

Step	Instructions
a	From the left navigation panel, click **Security Policies**.
b	Create a new Access Control Layer in the Access Control Policy.
c	In SmartConsole top left corner, click **Menu** > **Manage policies and layers**.
d	Select the existing policy and click **Edit** (the pencil icon). Alternatively, create a new policy.
e	From the navigation tree of the **Policy** window, click **General**.

Step	Instructions
f	In the **Policy Types** section, make sure you select **only** the **Access Control**.
g	In **Access Control** section, click on the **+** (plus) icon. A pop up window opens.
h	In the top right corner of this pop up window, click **New Layer**. The **Layer Editor** window opens.
i	From the navigation tree of the **Layer Editor** window, click **General**.
j	In the **Blades** section, make sure you select **only** the **Firewall**.
k	On other pages of the **Layer Editor** window, configure additional applicable settings. Click **OK**.
l	In the **Access Control** section, you see the **Network** Layer and the new **Access Control** Layer.
m	Click **OK** to save the changes and close the **Policy** window.
n	In SmartConsole, at the top, click the tab of the applicable policy.
o	In the **Access Control** section, click the new Access Control Layer. In the default rule, you must change the `Action` column from `Drop` to `Accept` to **not** affect the policy enforcement: ■ **Name** - Your text **Important** - You **cannot** use these strings: **<M&D>**, **<M&d>**, **<m&D>**, or **<m&d>** ■ **Source** - ***Any** ■ **Destination** - ***Any** ■ **VPN** - ***Any** ■ **Services & Applications** - ***Any** ■ **Action** - Must contain **Accept** ■ **Track** - **None** ■ **Install On** - ***Policy Targets**

Step	Instructions
p	Above the existing Cleanup rule, add the applicable rules for the traffic you wish to Mirror and Decrypt. You must configure the Mirror and Decrypt rules as follows: ■ **Name** - Must contain one of these strings (the angle brackets **<>** are mandatory): • **<M&D>** • **<M&d>** • **<m&D>** • **<m&d>** ■ **Source** - Select the applicable objects ■ **Destination** - Select the applicable objects ■ **VPN** - Must leave the default `*Any` ■ **Services & Applications** - Select the applicable services (to decrypt the HTTPS traffic, select the applicable HTTP, HTTPS, or Proxy services) ■ **Action** - Must contain **Accept** ■ **Track** - Select the applicable option (**None**, **Log**, or **Alert**) ■ **Install On** - Must contain one of these objects: • ***Policy Targets** (this is the default) • The Security Gateway, or Cluster object, whose version is **R80.20** or higher
	Important: ■ In the Mirror and Decrypt rules, you must **not** select Content criteria, such as Application, URL Filtering, Service matched by IP Protocol, Content Awareness. ■ Above the Mirror and Decrypt rules, you must **not** configure other rules that contain Content criteria, such as Application, URL Filtering, Service matched by IP Protocol, Content Awareness. ■ You must configure rules that contain an excluded source or an excluded destination above the Mirror and Decrypt rules. The **Name** column of these rules cannot contain these strings: **<M&D>**, **<M&d>**, **<m&D>**, or **<m&d>**.
q	Publish the SmartConsole session.
r	Install the Access Control Policy.

Step	Instructions
s	If in a Mirror and Decrypt rule you set the **Track** to **Log**, then you can filter the logs for this rule by the **Access Rule Name**, which contains the configured string: **<M&D>**, **<M&d>**, **<m&D>**, or **<m&d>**.

Configuring Mirror and Decrypt in SmartConsole for Several Virtual Systems

Workflow for several Virtual Systems:

1. Enable the HTTPS Inspection in the objects of applicable Virtual Systems (for decrypting the HTTPS traffic).

   Procedure

Step	Instructions
a	Connect with SmartConsole to the Management Server.
b	From the left navigation panel, click **Gateways & Servers**.
c	Open the Virtual System object.
d	From the navigation tree, click **HTTPS Inspection**.
e	View and export the certificate.
f	Check **Enable HTTPS Inspection**.
g	Click **OK**.

2. Configure the HTTPS Inspection Rule Base (for decrypting the HTTPS traffic).

   Procedure

Step	Instructions
a	From the left navigation panel, click **Security Policies**.
b	From the left tree, click **HTTPS Inspection**.
d	Configure the HTTPS Inspection Rule Base. See *R82 Security Management Administration Guide*. For more settings, in the **HTTPS Tools** section, click **Additional Settings**.
e	Publish the SmartConsole session.

3. Define the designated physical interface as VLAN Trunk in the object of the VSX Gateway, or VSX Cluster.

Procedure

Note - If the Recorder or Packet-Broker connects to the VSX Gateway / VSX Cluster Members / Scalable Platform Security Group through a Switch, configure a VLAN Trunk on the applicable Switch port. The VLAN Trunk port on the Switch must accept all VLAN IDs that you configure in the applicable Virtual Systems.

Step	Instructions
1	In SmartConsole, open the object of the VSX Gateway, or VSX Cluster.
2	From the navigation tree, click **Physical Interfaces**.
3	Check the box **VLAN Trunk** near the designated physical interface.
4	Click **OK**.

4. Add the designated physical interface in the object of each applicable Virtual System.

Procedure

Step	Instructions
a	In SmartConsole, open the Virtual System object.
b	From the navigation tree, click **Topology**.
c	From the top toolbar, click **New** > **Regular**.
d	On the **General** tab: i. In the **Interface** field, select the designated physical interface. ii. In the **IPv4 Configuration** section: ▪ In the **IP Address** field, enter a dummy IP address. ▪ In the **Net Mask** field, enter the applicable net mask. **Important** - This IP address cannot collide with other IP addresses used in your environment. This IP address cannot belong to subnets used in your environment. Make sure to configure the correct subnet mask. After you enable traffic mirroring on this interface in SmartConsole, all other traffic that is routed to this interface is dropped. iii. Do not check the **Propagate route to adjacent Virtual Devices (IPv4)**. iv. In the **MTU** field, enter the applicable MTU. See *"Mirror and Decrypt Requirements" on page 193*. v. In the **Security Zone** field, leave the default **None**. vi. Click **OK**.

5. Activate the Mirror and Decrypt in the object of each applicable Virtual System.

   Procedure

Step	Instructions
a	From the left navigation panel, click **Gateways & Servers**.
b	Open the Virtual System object.
c	From the left tree, click the **[+]** near the **Other** and click **Mirror and Decrypt**.
d	Check **Mirror gateway traffic to interface**. The **Mirror and Decrypt - User Disclaimer** window opens. i. Read the text carefully. ii. Check **I agree to the terms and conditions**. iii. Click **OK** to accept and close the disclaimer.
e	In the **Mirror gateway traffic to interface** field, select the designated physical interface.
f	Click **OK** to save the changes and close the Virtual System properties window.

6. Configure the Mirror and Decrypt rules in the Access Control Policy for the traffic you wish to mirror and decrypt.

   Procedure

   Best Practice - We recommend you to configure a new separate Access Control Layer to contain Mirror and Decrypt rules. Alternatively, you can configure the Mirror and Decrypt rules in the regular Rule Base.

   Important - When you configure the Mirror and Decrypt rules, these limitations apply:
   - In the Mirror and Decrypt rules, you must **not** select Content criteria, such as Application, URL Filtering, Service matched by IP Protocol, Content Awareness.
   - Above the Mirror and Decrypt rules, you must **not** configure other rules that contain Content criteria, such as Application, URL Filtering, Service matched by IP Protocol, Content Awareness.
   - You must configure rules that contain an excluded source or an excluded destination above the Mirror and Decrypt rules.
     The **Name** column of these rules cannot contain these strings: **<M&D>**, **<M&d>**, **<m&D>**, or **<m&d>**.

   The procedure below describes how to configure the Mirror and Decrypt rules in a separate Access Control Layer in SmartConsole:

Step	Instructions
a	From the left navigation panel, click **Security Policies**.
b	Create a new Access Control Layer in the Access Control Policy.
c	In SmartConsole top left corner, click **Menu** > **Manage policies and layers**.
d	Select the existing policy and click **Edit** (the pencil icon). Alternatively, create a new policy.
e	From the navigation tree of the **Policy** window, click **General**.
f	In the **Policy Types** section, make sure you select **only** the **Access Control**.
g	In **Access Control** section, click on the **+** (plus) icon. A pop up window opens.
h	In the top right corner of this pop up window, click **New Layer**. The **Layer Editor** window opens.
i	From the navigation tree of the **Layer Editor** window, click **General**.
j	In the **Blades** section, make sure you select **only** the **Firewall**.
k	On other pages of the **Layer Editor** window, configure additional applicable settings. Click **OK**.
l	In the **Access Control** section, you see the **Network** Layer and the new **Access Control** Layer.
m	Click **OK** to save the changes and close the **Policy** window.
n	In SmartConsole, at the top, click the tab of the applicable policy.

Step	Instructions
o	In the **Access Control** section, click the new Access Control Layer. In the default rule, you must change the `Action` column from `Drop` to `Accept` to **not** affect the policy enforcement: ■ **Name** - Your text **Important** - You **cannot** use these strings: **<M&D>**, **<M&d>**, **<m&D>**, or **<m&d>** ■ **Source** - ***Any** ■ **Destination** - ***Any** ■ **VPN** - ***Any** ■ **Services & Applications** - ***Any** ■ **Action** - Must contain **Accept** ■ **Track** - **None** ■ **Install On** - ***Policy Targets**
p	Above the existing Cleanup rule, add the applicable rules for the traffic you wish to Mirror and Decrypt. You must configure the Mirror and Decrypt rules as follows: ■ **Name** - Must contain one of these strings (the angle brackets **<>** are mandatory): • **<M&D>** • **<M&d>** • **<m&D>** • **<m&d>** ■ **Source** - Select the applicable objects ■ **Destination** - Select the applicable objects ■ **VPN** - Must leave the default `*Any` ■ **Services & Applications** - Select the applicable services (to decrypt the HTTPS traffic, select the applicable HTTP, HTTPS, or Proxy services) ■ **Action** - Must contain **Accept** ■ **Track** - Select the applicable option (**None**, **Log**, or **Alert**) ■ **Install On** - Must contain one of these objects: • ***Policy Targets** (this is the default) • The Security Gateway, or Cluster object, whose version is **R80.20** or higher

Step	Instructions
	Important: ■ In the Mirror and Decrypt rules, you must **not** select Content criteria, such as Application, URL Filtering, Service matched by IP Protocol, Content Awareness. ■ Above the Mirror and Decrypt rules, you must **not** configure other rules that contain Content criteria, such as Application, URL Filtering, Service matched by IP Protocol, Content Awareness. ■ You must configure rules that contain an excluded source or an excluded destination above the Mirror and Decrypt rules. The **Name** column of these rules cannot contain these strings: **<M&D>**, **<M&d>**, **<m&D>**, or **<m&d>**.
q	Publish the SmartConsole session.
r	Install the Access Control Policy.
s	If in a Mirror and Decrypt rule you set the **Track** to **Log**, then you can filter the logs for this rule by the **Access Rule Name**, which contains the configured string: **<M&D>**, **<M&d>**, **<m&D>**, or **<m&d>**.

Mirror and Decrypt Logs

To Mirror and Decrypt the traffic, you create special rules in the Access Control Policy.

The Mirror and Decrypt feature adds the applicable information to the regular Security Gateway logs.

To see the Mirror and Decrypt logs in SmartConsole:

Item	Description
1	Connect with SmartConsole to the Management Server.
2	From the left navigation panel, click **Logs & Events** > **Logs**.
3	In the search field, enter: `type:Control`
4	Double-click on the log and refer to the **More** section.

The Mirror and Decrypt logs show this information in the **More** section > **Mirror and Decrypt** field:

Action	Description
Mirror only	Security Gateway / Cluster only mirrored the traffic.
Decrypt and mirror	Security Gateway / Cluster decrypted and mirrored the HTTP / HTTPS traffic Note - This can be the case even for a clear-text HTTP connection, because the HTTPS Inspection inspects it first (example is all connections that use proxy 8080).
Partial mirroring (HTTPS inspection Bypass)	Security Gateway / Cluster started to decrypt the traffic, but stopped later due to a Bypass rule (for example, a rule with a Category). Therefore, the mirrored connection is not complete.

ConnectControl - Server Load Balancing

Important - Scalable Platforms (ElasticXL, Maestro, and Chassis) do **not** support this feature (Known Limitation MBS-14173).

ConnectControl is a Check Point solution for balancing the traffic that passes through Check Point Security Gateway or Cluster towards servers behind the Check Point Security Gateway or Cluster.

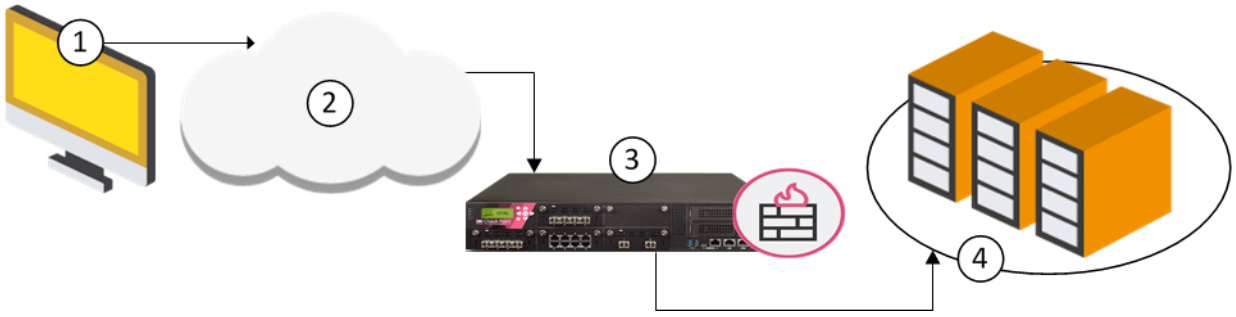
ConnectControl does not consume more memory or CPU processing power on Security Gateway or Cluster Members.

ConnectControl Packet Flow

Load-balanced servers are represented by one Virtual IP address.

In SmartConsole, you define a *Logical Server* object that represents a group of physical servers.

The Logical Server takes service requests for the load-balanced application and directs the requests to the applicable physical server.



When a client requests access to an application that is load balanced by ConnectControl, the request goes through the Security Gateway or Cluster.

Item	Description
1	**Client request** - A client starts a connection with the logical IP address of the application server (the address assigned to the Logical server).
2	**Internet** - The service request goes through the Internet.
3	**Security Gateway** - The service request arrives at the destination public IP address of the Logical Server, which is on the Security Gateway. The request is matched to the Logical Server rule in the Rule Base. The Security Gateway directs the request to the internal IP address of the Logical Server group.
4	**Logical Server** - ConnectControl determines which server in the Logical Server group is best for the request, based on the selected load-balancing method.

Note - Make sure that rules that allow traffic for services to ConnectControl Logical Servers and that server groups are before Access Control Policy rules that allow traffic for those services.

Configuring ConnectControl

This procedure explains the steps to set up ConnectControl in your environment.

Procedure

1. In the SmartConsole, click **Objects** menu > **Object Explorer** (or press **Ctrl+E**).
2. Define a **Host** object for each of the servers that will be load-balanced.

   In the **Object Explorer**, from the toolbar, click **New** > **Host**.
3. Define a **Network Group** object to contain all **Host** objects for each of the servers that will be load-balanced.

   Instructions

   In the **Object Explorer**, from the toolbar, click **New** > **Network Group**.

   a. Name the group (for example, `HTTP_Server_Group`).

   b. Add the **Host** objects for each of the servers.

   Best Practice - We recommend adding no more than 29 objects.
4. Define the **Logical Server** object.

   Instructions

   a. In the **Object Explorer**, from the toolbar, click **New** > **Network Object** > **More** > **Logical Server**.

   b. In the **New Logical Server** window, enter a name for the ConnectControl Logical Server.

c. Enter a Virtual IP address.

   Make sure the IP address is a public IP address.

   All traffic to be load-balanced, must be directed through the cluster.

   Note for a cluster environment

   If the assigned IP address is on the same subnet as a Cluster Virtual IP address, you also need to configure a Manual ARP proxy entry for this IP address.

   i. Click **Menu >Global properties > NAT - Network Address Translation**.

   ii. Select **Merge manual proxy ARP configuration**.

   iii. Click **OK**.

   iv. Configure the `$FWDIR/conf/local.arp` file as described in sk30197.

   v. Install the Access Control Policy on this cluster object.

d. Select the **Server type**.

Logical Server Types

When you create the Logical server object, configure the server type as **HTTP** or **Other**. This distinction is important. ConnectControl handles the connection to the client differently for each server type.

- The **HTTP** server type uses HTTP redirection.

  This type supports offsite HTTP servers and form-based applications, but only works with the HTTP protocol. An HTTP Logical server makes sure that all HTTP-connection sessions are directed to one server, which is a requirement for many Web applications. ConnectControl finds the correct physical server, behind the Security Gateway or offsite, based on the selected load-balancing method. The session connections continue to go to that one server.

- The **Other** server type uses NAT (address translation) to send traffic to the grouped servers.

  This Logical server supports all protocols (including HTTP) and gives the most effectively balanced load. It requires servers to be NATed by the Security Gateway. ConnectControl mediates each service request and then selects the server to get that request. It uses NAT to change the destination IP address of the incoming packet. If a return connection is opened, the connection is automatically established between the server and the client. The server's source address in the packet is translated to the IP address of the Logical server. On the packet's return, the Security Gateway translates the packet's original address to the IP address of the Logical server.

e. Select the **Server group**.

Select the **Server Group** object that you defined earlier (or define a new **Server Group** object).

The members of the group must be hosts, Security Gateways, or OSE devices.

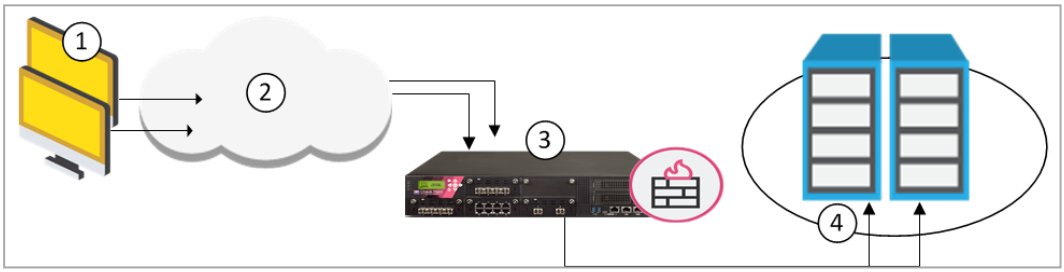
f. Select **Use persistent server mode** that fits your environment.

Important - Disable this option if currently there is only one logical server.

Persistency

This setting maintains a client's connection to the server that ConnectControl first selected.

- **Persistency by server** is useful for HTTP applications, such as forms, in a load-balanced environment with multiple Web servers. ConnectControl directs an HTTP client to one server for all requests. This allows clients to fill forms without the data loss that occurs if different servers take the requests.
- **Persistency by service** is useful if you are load balancing multiple services in your server group. For example, in a redundant environment of two servers, each running HTTP and FTP, ConnectControl directs traffic from one client to the server of the correct service. This prevents heavy load on one server, which can happen with **Persistency by server**.



Item	Description
1	Multiple client requests for HTTP and FTP.
2	Internet.
3	Security Gateway. The service requests arrive at the destination public IP address of the Logical Server, which is on the Security Gateway. The Security Gateway directs the requests to the internal IP address of the Logical Server group.
4	Logical Server group with two servers, each with FTP and HTTP services. ConnectControl balances the load between the servers.

g. Select a **Balance method** that fits your environment.

Load Balancing Methods

ConnectControl distributes network traffic to load-balanced servers according to one of these predefined balancing methods:

Method	Description
Random	The Security Gateway directs service requests to servers at random. This method is a good choice when all the load-balanced servers have similar RAM and CPU and are located on the same segment.
Server load	The Security Gateway determines which server is best equipped to handle the new connection.
Round Robin	The Security Gateway directs service requests to the next server in the sequence. This method is a good choice when all the load balanced servers have similar RAM and CPU and are on the same segment.
Round Trip	Not supported.
Domain	Not supported.

h. Click **OK**.

5. Close the Object Explorer window.
6. From the left navigation panel, click Security Policies and click **Access Control**.
7. Add the Load Balancing rule to the Access Control Policy Rule Base:

Source	Destination	Services & Applications	Action

`*Any`	*Logical Server object*	*Load-balanced Services*	`Accept`
			or
			`User Auth`
			or
			`Client Auth`

8. For applications that use HTTP redirection, add a rule to allow the Network Group object (that contains load-balanced server objects) to communicate directly with the clients:

Source	Destination	Services & Applications	Action
*Any	*Network Group object*	http	Accept

9. Configure global settings for ConnectControl.

   Instructions

   a. At the top, click **Menu** > **Global properties**.

   b. From the left tree, click **ConnectControl**.

   c. Configure the settings that fit your environment:

      - **Server Availability**

        This configures how ConnectControl finds available servers.

        - The **Server availability check interval** control the number of seconds between pings from the Security Gateway or Cluster to the load-balanced servers.
        - The **Server check retries** controls the number of attempts to contact a non-responsive server after ConnectControl stops directing connections to it.

      - **Server Persistency**

        If you enabled **Persistency by server**, you can set a timeout for a client to use one server. If a server becomes unavailable, ConnectControl directs new connections to a new, available server. This bypasses the persistency and optimizes load balancing.

      - **Server Load Balancing**

        Not supported.

   d. Click **OK**.

10. Install the Access Control Policy on this Security Gateway or Cluster object.

Monitoring Software Blade

Important - Scalable Platforms (ElasticXL, Maestro, and Chassis) do **not** support this feature.

This Software Blade enables administrator to monitor these counters in real-time:

- System counters (CPU usage, Used Virtual Memory, Free Disk Space, and so on)
- Traffic connections
- Traffic throughput

To see System and Traffic counters in SmartConsole:

1. From the left navigation panel, click **Gateways & Servers**.
2. In the top pane, select the Security Gateway (or Cluster) object.
3. In the bottom pane, click the **Summary** tab and click the **Device & License Information** link at the bottom.
4. From the left tree, click **System Counters** and **Traffic**.
5. For a cluster object, from the top drop-down menu, select the Cluster Member.

To see User and VPN Tunnel counters in SmartView Monitor:

1. From the left navigation panel, click **Logs & Events** > **Logs**.
2. At the bottom, click the **Tunnel & User Monitoring** link.

For more information, see the *R82 Logging and Monitoring Administration Guide*.

Cloud Security

Important - Scalable Platforms (ElasticXL, Maestro, and Chassis) do **not** support this feature.

Check Point cloud security protects assets in the cloud from the most sophisticated threats with dynamic scalability, intelligent provisioning and consistent control across physical and virtual networks.

For more information, see:

- *R82 CloudGuard Controller Administration Guide*
- sk173705 - Check Point CloudGuard Network for Public Cloud solutions
- sk132552 - Check Point CloudGuard Network for Private Cloud solutions

Advanced Routing

Gaia OS supports:

- Dynamic Routing protocols - OSPF, BGP, and RIP.
- Dynamic Multicast Routing - PIM Sparse Mode (SM), PIM Dense Mode (DM), PIM Source-Specific Multicast (SSM), and IGMP.
- Different routing options.

You can configure these routing protocols and options in Gaia Portal and Gaia Clish.

For more information, see the *R82 Gaia Advanced Routing Administration Guide*.

SNMP

SNMP, as implemented on Check Point platforms, enables an SNMP manager to monitor the device using `GetRequest`, `GetNextRequest`, `GetBulkRequest`, and a select number of traps.

The Check Point implementation also supports using `SetRequest` to change these attributes: `sysContact`, `sysLocation`, and `sysName`. You must configure read-write permissions for set operations to work.

Check Point Gaia supports SNMP v1, v2, and v3.

For more information, see the *R82 Gaia Administration Guide* > Chapter *System Management* > Section *SNMP*.

Security Servers

Overview

Security Servers on a Security Gateway are user space processes that perform content security and authentication for various protocols.

The parent process FWD on a Security Gateway starts the applicable Security Server process in these cases:

- In an Access Control rule, the **Services & Applications** column contains a **Resource** object.
- In an Access Control rule, the **Action** column contains the value **User Auth** or **Client Auth**.
- An IPS protection requires a Security Server process to complete its inspection.

The Security Server processes save their messages in the corresponding log files (see sk97638).

The `$FWDIR/conf/fwauthd.conf` file on a Security Gateway contains the list of the supported Security Server user space processes:

1. Connect to the command line on the Security Gateway.
2. Log in to the Expert mode.

3. Run:

```
cat $FWDIR/conf/fwauthd.conf
```

Example output from R82 Take 777 (manually formatted for better visibility):

```
[Expert@MyGW:0]# cat $FWDIR/conf/fwauthd.conf
21      fwssd             in.aftpd                    wait    0
80      fwssd             in.ahttpd                   wait    -8
513     fwssd             in.arlogind                 wait    0
25      fwssd             in.asmtpd                   wait    0
2525    fwssd             in.emaild.smtp              wait    0
110     fwssd             in.emaild.pop3              wait    0
23      fwssd             in.atelnetd                 wait    0
#259    fwssd             in.aclientd                 wait    259
10081   fwssd             in.lhttpd                   wait    0
900     fwssd             in.ahclientd                wait    900
45232   fwdlp             fwdlpd                      wait    -6
45233   cp_file_convert   cp_file_convertd            wait    -6
45234   dlp_fingerprint   dlp_fingerprintd           wait    0
45235   fwdlp             discovery_fwdlpd            wait    -6
45236   cp_file_convert   discovery_cp_file_convertd  wait    0
45237   cp_file_convert   scrub_cp_file_convertd      wait    0
45238   cp_file_convert   watermark_cp_file_convertd  wait    0
0       fwssd             in.pingd                    respawn 0
0       fwssd             in.asessiond                respawn 0
0       fwssd             in.aufpd                    respawn 0
0       fwssd             in.ufclnt                   respawn 0
0       fwssd             in.ufsrvr                   respawn 0
0       vpn               vpnd                        respawn 0
0       ccc               cccd                        respawn 0
0       tlsdepd           tlsdepd                     respawn 0
0       fwssd             mdq                         respawn 0
0       stormd            stormd                      respawn 0
0       igwd              igwd                        respawn 0
0       fwssd             in.emaild.mta               respawn 0
0       fwssd             in.msd                      respawn 0
0       sds               sdsd                        respawn 0
0       dtps              dtpsd                       respawn 0
0       dtls              dtlsd                       respawn 0
0       pdpd              pdpd                        respawn 0   -t
0       pepd              pepd                        respawn 0   -t
0       usrchkd           usrchkd                     respawn 0
0       fwpushd           fwpushd                     respawn 0
0       ted               ted                         respawn 0
0       scrubd            scrubd                      respawn 0
0       sessiond          sessiond                    respawn 0   sessiond.elg sessiond.C
0       mta_monitor       mta_monitor                 respawn 0
0       tpd               tpd                         respawn 0
0       zphd              zphd                        respawn 0
0       tls_statsd        tls_statsd                  respawn 0
[Expert@MyGW:0]#
```

Important Notes

1. Do **not** make any changes in the `$FWDIR/conf/fwauthd.conf` file, unless Check Point R&D or Support explicitly told you to do so.
2. In a Cluster, you must configure all the Cluster Members in the same way.
3. Before you make any changes in the `$FWDIR/conf/fwauthd.conf` file, create a backup copy:
   - On a Security Gateway / each Cluster Member:

     ```
     cp -v $FWDIR/conf/fwauthd.conf{,_BKP}
     ```

   - On a Scalable Platform Security Group:

     ```
     g_all cp -v $FWDIR/conf/fwauthd.conf{,_BKP}
     ```

4. If you changed the `$FWDIR/conf/fwauthd.conf` file on a Scalable Platform Security Group, then you must copy the modified file to all Security Group Members:

   ```
   asg_cp2blades $FWDIR/conf/fwauthd.conf}
   ```

5. After you make changes in the `$FWDIR/conf/fwauthd.conf` file, it is necessary to stop and start all Check Point process with the "`cpstop ; cpstart`" commands.

   This stops all traffic through the Security Gateway / Cluster / Security Group.

   In a cluster, this can cause a failover.

Explanation about the $FWDIR/conf/fwauthd.conf File

Column	Description	Examples

1st from the left	Number of the port, on which the Security Server process is listening to incoming traffic.
	Value "0" means it is not supported to configure a different port number.
	Note - To prevent a Security Server process from starting, add the pound "#" character at the beginning of this column.
	Example:
	`#21 fwssd in.aftpd wait 0`
		`21`
		`80`
		`0`

2nd	General name of the Security Server process.	`fwssd` `vpn`
3rd	Specific name of the Security Server process.	`in.aftpd` `usrchkd`
4th	Controls how to start the Security Server process: ■ `wait` Starts the Security Server process only when the applicable incoming traffic arrives. ■ `respawn` Makes sure that one Security Server process is always running.	`wait` `respawn`
5th	Controls how many Security Server process to start: ■ Value "0" means that only one Security Server process starts. ■ Value "8" means that a maximum of eight Security Server processes start. ■ Minus in front of the number means that the same Security Server process inspects the same connection (sticky inspection). ■ Values "259" and "900" are reserved for Client Authentication and denote a port number.	`0` `-8`

Column	Description	Examples

6th	Specific advanced parameters for the Security Server process:
	■ `-t` or `-d`
	Specifies to generate only basic log messages (`-t`) or debug log messages (`-d`).
	■ `sessiond.elg sessiond.C`
	Specifies the log file and the configuration file.
	■ `ssl:defaultCert`
	Specifies to use the default SSL certificate.
		`-t`
		`-d`
		`sessiond.elg`
		`sessiond.C`
		`ssl:defaultCert`

List of Security Servers

For additional information, see sk97638.

Main Security Server Process	Specific Security Server Process	Log File	Purpose	Description
`fwssd`	`in.aclientd`	`$FWDIR/log/aclientd.elg`	Authentication	Client Authentication process (port 259).
`fwssd`	`in.aftpd`	`$FWDIR/log/aftpd.elg`	Content inspection	FTP Security Server.
`fwssd`	`in.ahclientd`	`$FWDIR/log/ahclientd.elg`	Authentication	Client Authentication via Web (port 900). This process starts when user initiates Client Authentication through a web browser.

Main Security Server Process	Specific Security Server Process	Log File	Purpose	Description
fwssd	in.ahttpd	$FWDIR/log/ahttpd.elg	Content inspection	HTTP Security Server.
fwssd	in.arlogind	$FWDIR/log/arlogind.elg	Content inspection	RLogin Security Server.
fwssd	in.asessiond	$FWDIR/log/asessiond.elg	Authentication	Session Authentication Security Server Agent.
fwssd	in.asmtpd	$FWDIR/log/asmtpd.elg	Content inspection	SMTP Security Server (used to receive SMTP messages).
fwssd	mdq	$FWDIR/log/mdq.elg	Content inspection	Mail DeQueuer daemon (delivers mail messages queued by in.asmtpd).
fwssd	in.atelnetd	$FWDIR/log/atelnetd.elg	Content inspection	Telnet Security Server.
fwssd	in.aufpd	$FWDIR/log/aufpd.elg	Content inspection	URL Filtering Protocol (UFP) daemon (communicates with UFP server).

Main Security Server Process	Specific Security Server Process	Log File	Purpose	Description
fwssd	in.emaild.mta	$FWDIR/log/emaild.elg	Content inspection	E-Mail Security Server (Anti-Virus scanning of e-mails).
fwssd	in.emaild.pop3	$FWDIR/log/emaild.elg	Content inspection	POP3 Security Server (Anti-Virus scanning of incoming e-mails).
fwssd	in.emaild.smtp	$FWDIR/log/emaild.elg	Content inspection	SMTP Security Server (Anti-Virus scanning of outgoing e-mails).

Main Security Server Process	Specific Security Server Process	Log File	Purpose	Description
fwssd	in.lhttpd	$FWDIR/log/lhttpd.elg	Load balancing	Load Balancing daemon is the user mode process that handles HTTP requests, when the load balancing method is set to HTTP - listens for and redirects HTTP requests coming for load balancing.
fwssd	in.msd	$FWDIR/log/msd.elg	Content inspection	Mail Security Daemon that queries the Commtouch engine for reputation.
fwssd	in.pingd	$FWDIR/log/pingd.elg	Load balancing	Load balancing or/and Client Authentication in the "Wait" mode.

Main Security Server Process	Specific Security Server Process	Log File	Purpose	Description
fwssd	in.ufclnt	$FWDIR/log/ufclnt.elg	Content inspection	URL Filtering Protocol Client (from the R71 version, part of the URL Filtering engine in kernel).
fwssd	in.ufsrvr	$FWDIR/log/ufsrvr.elg	Content inspection	URL Filtering Protocol Server (from the R71 version, part of the URL Filtering engine in kernel).
fwdlp	fwdlpd	$FWDIR/log/fwdlp.elg	Content inspection	Data Loss Prevention (DLP) core engine that performs the scanning / inspection.
fwdlp	discovery_fwdlpd	$FWDIR/log/discovery_fwdlpd.elg	Content inspection	Dedicated discovery process for the Data Loss Prevention (DLP) core engine.

Main Security Server Process	Specific Security Server Process	Log File	Purpose	Description
dlp_fingerprint	dlp_fingerprintd	$FWDIR/log/dlp_fingerprintd.elg	Content inspection	Identifies the data according to a unique signature known as a fingerprint stored in your Data Loss Prevention (DLP) repository.
cp_file_convert	cp_file_convertd	$FWDIR/log/cp_file_convertd.elg	Content inspection	Converts various file formats to simple textual format for scanning by the Data Loss Prevention (DLP) engine.
cp_file_convert	discovery_cp_file_convertd	$FWDIR/log/discovery_cp_file_convertd.elg	Content inspection	Dedicated file conversion process for the Data Loss Prevention (DLP) core engine.

Main Security Server Process	Specific Security Server Process	Log File	Purpose	Description
cp_file_convert	scrub_cp_file_convertd	$FWDIR/log/scrub_cp_file_convertd.elg	Content inspection	Dedicated file conversion process for the Threat Extraction core engine. convert
cp_file_convert	watermark_cp_file_convertd	$FWDIR/log/watermark_cp_file_convertd.elg	Content inspection	Dedicated file conversion process for the Data Loss Prevention (DLP) core engine.
vpn	vpnd	$FWDIR/log/vpnd.elg	VPN	Session Authentication Agent.
ccc	cccd	$FWDIR/log/cccd.elg	VPN	Client Communication Channel (CCC) protocol.
sds	sdsd	$FWDIR/log/sdsd.elg	VPN	Software Distribution Server. Distributes software to SecureClient users.

Main Security Server Process	Specific Security Server Process	Log File	Purpose	Description
dtps	dtpsd	$FWDIR/log/dtpsd.elg	VPN	Desktop Policy Server. SecureClient users fetch policy from this Desktop Policy Server.
dtls	dtlsd	$FWDIR/log/dtlsd.elg	VPN	Desktop Log Server. Receives logs from SecureClient users.
pdpd	pdpd	$FWDIR/log/pdpd.elg	Content inspection	Identity Awareness Policy Decision Point.
pepd	pepd	$FWDIR/log/pepd.elg	Content inspection	Identity Awareness Policy Enforcement Point.
usrchkd	usrchkd	$FWDIR/log/usrchkd.elg	Content inspection	UserCheck main daemon that deals with UserCheck requests (from CLI / from the user) that are sent from the UserCheck Web Portal.

Main Security Server Process	Specific Security Server Process	Log File	Purpose	Description
tpd	tpd	$FWDIR/log/tpd.elg	Content inspection	Threat Prevention Daemon - communicates with the kernel and deals with User Space tasks.
ted	ted	$FWDIR/log/ted.elg	Content inspection	Threat Emulation daemon engine - responsible for emulating files and communication with the cloud.
scrubd	scrubd	$FWDIR/log/scrubd.elg	Content inspection	Threat Extraction main daemon.
fwpushd	fwpushd	$FWDIR/log/fwpushd.elg	Content inspection	Mobile Access Push Notifications daemon that is controlled by the "fwpush" command.
sessiond	sessiond	$FWDIR/log/sessiond.elg	Content inspection	Mobile Access session daemon.

Main Security Server Process	Specific Security Server Process	Log File	Purpose	Description
mta_ monitor	mta_monitor	$FWDIR/log/mtad.elg	Content inspection	Mail Transfer Agent (MTA) monitoring.
zphd	zphd	$FWDIR/log/zphd.elg	Content inspection	Zero Phishing.
tlsdepd	tlsdepd	$FWDIR/log/tlsdepd. elg	Content inspection	HTTPS Inspection Learning Mode.
tls_ statsd	tls_statsd	$FWDIR/log/tls_ statsd.elg	Content inspection	HTTPS Inspection Statistics.
igwd	igwd	$FWDIR/log/igwd.elg	Content inspection	Cooperative Enforcement (drops packets from endpoint computers that either do not have Endpoint Security Client installed, or are in a non-compliant state).
stormd	stormd	$FWDIR/log/stormd.e lg	Content inspection	IPS Storm Center Module.

Deploying a Single Security Gateway in Monitor Mode

Introduction to Monitor Mode

You can configure Monitor Mode on a single Check Point Security Gateway's interface.

The Check Point Security Gateway listens to traffic from a Mirror Port or Span Port on a connected switch.

Use the Monitor Mode to analyze network traffic without changing the production environment.

The mirror port on a switch duplicates the network traffic and sends it to the Security Gateway with an interface configured in Monitor Mode to record the activity logs.

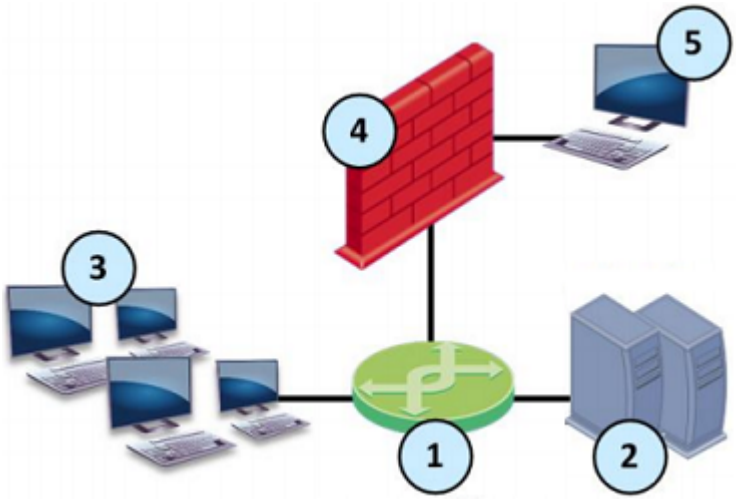
You can use the Monitor Mode:

- To monitor the use of applications as a permanent part of your deployment
- To evaluate the capabilities of the Software Blades:
  - The Security Gateway neither enforces any security policy, nor performs any active operations (prevent / drop / reject) on the interface in the Monitor Mode.
  - The Security Gateway terminates and does not forward all packets that arrive at the interface in the Monitor Mode.
  - The Security Gateway does not send any traffic through the interface in the Monitor Mode.

Benefits of the Monitor Mode include:

- There is no risk to your production environment.
- It requires minimum set-up configuration.
- It does not require TAP equipment, which is expensive.

Example Topology for Monitor Mode



Item	Description
1	Switch with a mirror or SPAN port that duplicates all incoming and outgoing packets. The Security Gateway connects to a mirror or SPAN port on the switch.
2	Servers.
3	Clients.
4	Security Gateway with an interface in Monitor Mode.
5	Security Management Server that manages the Security Gateway.

For More About Monitor Mode

See the:

- *R82 Installation and Upgrade Guide* > Chapter *Special Scenarios for Security Gateways* > Section *Deploying a Security Gateway in Monitor Mode*.
- *R82 Scalable Platforms Administration Guide* > Chapter *Deploying a Security Group in Monitor Mode*.

Deploying a Single Security Gateway or ClusterXL in Bridge Mode

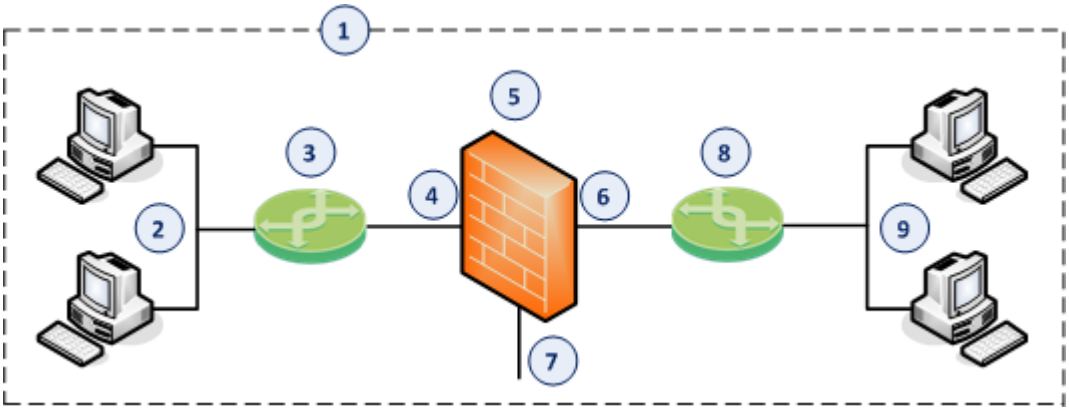
Introduction to Bridge Mode

If you cannot divide the existing network into several networks with different IP addresses, you can install a Check Point Security Gateway (or a ClusterXL) in the Bridge Mode.

A Security Gateway (or ClusterXL) in Bridge Mode is invisible to Layer 3 traffic.

When traffic arrives at one of the bridge subordinate interfaces, the Security Gateway (or Cluster Members) inspects it and passes it to the second bridge subordinate interface.

Example Topology for a single Security Gateway in Bridge Mode



Item	Description
1	Network, which an administrator needs to divide into two Layer 2 segments. The Security Gateway in Bridge Mode connects between these segments.
2	First network segment.
3	Switch that connects the first network segment to one bridged subordinate interface **(4)** on the Security Gateway in Bridge Mode.
4	One bridged subordinate interface (for example, `eth1`) on the Security Gateway in Bridge Mode.
5	Security Gateway in Bridge Mode.
6	Another bridged subordinate interface (for example, `eth2`) on the Security Gateway in Bridge Mode.
7	Dedicated Gaia Management Interface (for example, `eth0`) on the Security Gateway.
8	Switch that connects the second network segment to the other bridged subordinate interface **(6)** on the Security Gateway in Bridge Mode.
9	Second network segment.

For More About Bridge Mode

See the:

- *R82 Installation and Upgrade Guide* > Chapter *Special Scenarios for Security Gateways* > Section *Deploying a Security Gateway or a ClusterXL in Bridge Mode*.
- *R82 Scalable Platforms Administration Guide* > Chapter *Deploying a Security Group in Bridge Mode*.

Security Before Firewall Activation

Important - This section does **not** apply to Scalable Platforms (ElasticXL, Maestro, and Chassis).

To protect the Security Gateway and network, Check Point Security Gateway has baseline security:

Baseline Security	Name of Policy	Description
Boot Security	`defaultfilter`	Security during boot process.
Initial Policy	`InitialPolicy`	Security before a policy is installed for the first time, or when Security Gateway failed to load the policy.

Important - If you disable the boot security or unload the currently installed policy, you leave your Security Gateway, or a Cluster Member without protection.

Best Practice - Before you disable the boot security, we recommend to disconnect your Security Gateway, or a Cluster Member from the network completely.

For additional information, see these commands in the *R82 CLI Reference Guide*:

Command	Description
`$CPDIR/bin/cpstat -f policy fw`	Shows the currently installed policy
`$FWDIR/bin/control_bootsec {-r | -R}`	Disables the boot security
`$FWDIR/bin/control_bootsec [-g | -G]`	Enables the boot security
`$FWDIR/bin/comp_init_policy [-u | -U]`	Deletes the local state policy
`$FWDIR/bin/comp_init_policy [-g | -G]`	Creates the local state Initial Policy
`$FWDIR/bin/fw unloadlocal`	Unloads the currently installed policy

Boot Security

Important - This section does **not** apply to Scalable Platforms (ElasticXL, Maestro, and Chassis).

The Boot Security protects the Security Gateway and its networks, during the boot:

- Disables the IP Forwarding in Linux OS kernel
- Loads the Default Filter Policy

Important - In a Cluster, you must configure all the Cluster Members in the same way.

The Default Filter Policy

The Default Filter Policy (`defaultfilter`) protects the Security Gateway from the time it boots up until it installs the user-defined Security Policy.

Boot Security disables IP Forwarding and loads the Default Filter Policy.

There are three Default Filters templates on the Security Gateway:

Default Filter Mode	Default Filter Policy File	Description
Boot Filter	`$FWDIR/lib/defaultfilter.boot`	This filter: ■ Drops all incoming packets that have the same source IP addresses as the IP addresses assigned to the Security Gateway interfaces ■ Allows all outbound packets from the Security Gateway

Default Filter Mode	Default Filter Policy File	Description
Drop Filter	`$FWDIR/lib/defaultfilter.drop`	This filter drops all inbound *and* outbound packets on the Security Gateway. **Best Practice** - If the boot process requires that the Security Gateway communicate with other hosts, do **not** use the *Drop Filter*.
Filter for Dynamically Assigned Gateways (DAG)	`$FWDIR/lib/defaultfilter.dag`	This filter for Security Gateways with Dynamically Assigned IP address: ■ Allows all DHCP Requests ■ Allows all DHCP Replies ■ Uses Boot Filter: a. Drops all incoming packets that have the same source IP addresses as the IP addresses assigned to the Security Gateway interfaces b. Allows all outbound packets from the Security Gateway

Selecting the Default Filter Policy

Step	Instructions
1	Make sure to configure and install a Security Policy on the Security Gateway.
2	Connect to the command line on the Security Gateway.
3	Log in to the Expert mode.
4	Back up the current Default Filter Policy file: `cp -v $FWDIR/conf/defaultfilter.pf{,_BKP}`

5	Create a new Default Filter Policy file.
	■ To create a new Boot Filter, run:
	`cp -v $FWDIR/lib/defaultfilter.boot $FWDIR/conf/defaultfilter.pf`
	■ To create a new Drop Filter, run:
	`cp -v $FWDIR/lib/defaultfilter.drop $FWDIR/conf/defaultfilter.pf`
	■ To create a new DAG Filter, run:
	`cp -v $FWDIR/lib/defaultfilter.dag $FWDIR/conf/defaultfilter.pf`

6	Compile the new Default Filter file:
	`fw defaultgen`
	■ The new complied Default Filter file for IPv4 traffic is:
	`$FWDIR/state/default.bin`
	■ The new complied Default Filter file for IPv6 traffic is:
	`$FWDIR/state/default.bin6`

7	Get the path of the Default Filter Policy file:
	`$FWDIR/boot/fwboot bootconf get_def`
	Example:
	`[Expert@MyGW:0]# $FWDIR/boot/fwboot bootconf get_def`
	`/etc/fw.boot/default.bin`
	`[Expert@MyGW:0]#`

Step	Instructions

8	Copy new complied Default Filter file to the path of the Default Filter Policy file.
	■ For IPv4 traffic, run:
	`cp -v $FWDIR/state/default.bin /etc/fw.boot/default.bin`
	■ For IPv6 traffic, run:
	`cp -v $FWDIR/state/default.bin6 /etc/fw.boot/default.bin6`

9	Make sure to connect to the Security Gateway over a serial console. **Important** - If the new Default Filter Policy fails and blocks all access through the network interfaces, you can unload that Default Filter Policy and install the working policy.
10	Reboot the Security Gateway.

Defining a Custom Default Filter

Administrators with Check Point INSPECT language knowledge can define customized Default Filters.

Important - Make sure your customized Default Filter policy does not interfere with the Security Gateway boot process.

Step	Instructions
1	Make sure to configure and install a Security Policy on the Security Gateway.
2	Connect to the command line on the Security Gateway.
3	Log in to the Expert mode.
4	Back up the current Default Filter Policy file: `cp -v $FWDIR/conf/defaultfilter.pf{,_BKP}`

Step	Instructions

5	Create a new Default Filter Policy file.
	■ To use the Boot Filter as a template, run:
	`cp -v $FWDIR/lib/defaultfilter.boot $FWDIR/conf/defaultfilter.pf`
	■ To use the Drop Filter as a template, run:
	`cp -v $FWDIR/lib/defaultfilter.drop $FWDIR/conf/defaultfilter.pf`
	■ To use the DAG Filter as a template, run:
	`cp -v $FWDIR/lib/defaultfilter.dag $FWDIR/conf/defaultfilter.pf`

6	Edit the new Default Filter Policy file to include the applicable INSPECT code. **Important** - Your customized Default Filter must not use these functions: ■ Logging ■ Authentication ■ Encryption ■ Content Security

7	Compile the new Default Filter file:
	`fw defaultgen`
	■ The new complied Default Filter file for IPv4 traffic is:
	`$FWDIR/state/default.bin`
	■ The new complied Default Filter file for IPv6 traffic is:
	`$FWDIR/state/default.bin6`

8	Get the path of the Default Filter Policy file:
	`$FWDIR/boot/fwboot bootconf get_def`
	Example:
	`[Expert@MyGW:0]# $FWDIR/boot/fwboot bootconf get_def`
	`/etc/fw.boot/default.bin`
	`[Expert@MyGW:0]#`

Step	Instructions

9	Copy new complied Default Filter file to the path of the Default Filter Policy file.
	■ For IPv4 traffic, run:
	`cp -v $FWDIR/state/default.bin /etc/fw.boot/default.bin`
	■ For IPv6 traffic, run:
	`cp -v $FWDIR/state/default.bin6 /etc/fw.boot/default.bin6`

10	Make sure to connect to the Security Gateway over a serial console. **Important** - If the new Default Filter Policy fails and blocks all access through the network interfaces, you can unload that Default Filter Policy and install the working policy.
11	Reboot the Security Gateway.

Using the Default Filter Policy for Maintenance

It is sometimes necessary to stop the Security Gateway for maintenance. It is not always practical to disconnect the Security Gateway from the network (for example, if the Security Gateway is on a remote site).

To stop the Security Gateway for maintenance and maintain security, you can run:

Command	Description
`cpstop -fwflag -default`	■ Shuts down Check Point processes ■ Loads the Default Filter policy (`defaultfilter`)
`cpstop -fwflag -proc`	■ Shuts down Check Point processes ■ Keeps the currently loaded kernel policy ■ Maintains the Connections table, so that after you run the `cpstart` command, you do not experience dropped packets because they are "out of state" **Note** - Only security rules that do not use user space processes continue to work.

The Initial Policy

Important - This section does **not** apply to Scalable Platforms (ElasticXL, Maestro, and Chassis).

Until the Security Gateway administrator installs the Security Policy on the Security Gateway for the first time, security is enforced by an Initial Policy.

The Initial Policy operates by adding the predefined implied rules to the Default Filter policy.

These implied rules forbid most communication, yet allow the communication needed for the installation of the Security Policy.

The Initial Policy also protects the Security Gateway during Check Point product upgrades, when a SIC certificate is reset on the Security Gateway, or in the case of a Check Point product license expiration.

Note - During a Check Point upgrade, a SIC certificate reset, or license expiration, the Initial Policy overwrites the user-defined policy.

The sequence of actions during boot of the Security Gateway until a Security Policy is loaded for the first time:

Step	Instructions
1	The Security Gateway boots up.
2	The Security Gateway disables IP Forwarding and loads the Default Filter policy.
3	The Security Gateway configures the interfaces.
4	The Security Gateway services start.
5	The Security Gateway fetches the Initial Policy from the local directory.
6	Administrator installs the user-defined Security Policy from the Management Server.

The Security Gateway enforces the Initial Policy until administrator installs a user-defined policy.

In subsequent boots, the Security Gateway loads the user-defined policy immediately after the Default Filter policy.

There are different Initial Policies for Standalone and distributed setups:

- In a Standalone configuration, where the Security Management Server and the Security Gateway are on the same computer, the Initial Policy allows CPMI management communication only.

  This permits SmartConsole clients to connect to the Security Management Server.

- In a distributed configuration, where the Security Management Server is on one computer and the Security Gateway is on a different computer, the Initial Policy:

  - Allows the **cpd** and **fwd** daemons to communicate for SIC (to establish trust) and for Policy installation.
  - Does not allow CPMI connections through the Security Gateway.

    The SmartConsole is not be able to connect to the Security Management Server, if the SmartConsole must access the Security Management Server through a Security Gateway with the Initial Policy.

Troubleshooting: Cannot Complete Reboot

Important - This section does **not** apply to Scalable Platforms (ElasticXL, Maestro, and Chassis).

In some configurations, the Default Filter policy prevents the Security Gateway from completing the reboot after installation.

Firstly, look at the Default Filter. Does the Default Filter allow traffic required by the boot procedures?

Secondly, if the boot process cannot finish successfully, remove the Default Filter:

Step	Instructions
1	Connect to the Security Gateway over serial console.
2	Reboot the Security Gateway.
3	During boot, press any key to enter the Boot Menu.
4	Select the **Start in maintenance mode**.
5	Enter the Expert mode password.

6	Set the Default Filter to not load again:
	a. Go to the `$FWDIR` directory:
	`cd /opt/CPsuite-<VERSION>/fw1/`
	b. Set the Default Filter to not load again:
	`./fwboot bootconf set_def`

7	In the `$FWDIR/boot/boot.conf` file, examine the value of the "`DEFAULT_FILTER_PATH`":
	a. Go to the `$FWDIR` directory:
	`cd /opt/CPsuite-<VERSION>/fw1/`
	b. examine the value of the "`DEFAULT_FILTER_PATH`":
	`grep DEFAULT_FILTER_PATH boot/boot.conf`

8	Reboot the Security Gateway.

Command Line Reference

See the *R82 CLI Reference Guide*.

Important - For Scalable Platforms, see the chapter "**Working with Command Line**" in *R82 Scalable Platforms Administration Guide*.

Working with Kernel Parameters

This section describes what are kernel parameters, and how to view and configure their values on a Security Gateway, ClusterXL Cluster Members, or a Scalable Platform Security Group.

Introduction to Kernel Parameters

Kernel parameters let you change the advanced behavior of your Security Gateway / Cluster Members / Scalable Platform Security Group.

These are the supported types of kernel parameters:

Type	Description
Integer	Accepts only one integer value.
String	Accepts only a plain-text string.

Important:

- In Cluster, you must see and configure the same value for the same kernel parameter on *each* Cluster Member.
- In VSX Gateway, the configured values of kernel parameters apply to all existing Virtual Systems and Virtual Routers.
- On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.

Security Gateway / Cluster Member / Security Group gets the names and the default values of the kernel parameters from these kernel module files:

- `$FWDIR/boot/modules/fw_kern_64.o`
- `$FWDIR/boot/modules/fw_kern_64_v6.o`
- `$PPKDIR/boot/modules/sim_kern_64.o`
- `$PPKDIR/boot/modules/sim_kern_64_v6.o`

Firewall Kernel Parameters

To change the internal default behavior of Firewall or to configure special advanced settings for Firewall, you can use Firewall kernel parameters.

The names of applicable Firewall kernel parameters and their values appear in various SK articles in *Check Point Support Center*, and provided by *Check Point Support*.

Important:

- The names of Firewall kernel parameters are case-sensitive.
- You can configure most of the Firewall kernel parameters on-the-fly with the "`fw ctl set`" command.
  This change does **not** survive a reboot.
  You can use the "`fw ctl set -f`" command to make this change permanent as well.
- You can configure some of the Firewall kernel parameters only permanently in the special configuration file `$FWDIR/boot/modules/fwkern.conf` command.
  You must manually edit these files.
  This requires a maintenance window, because the new values of the kernel parameters take effect only after a reboot.
- In a Cluster, you must configure all the Cluster Members in the same way.
- On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.

Examples of Firewall kernel parameters

Type	Name

Integer	`fw_allow_simultaneous_ping`
	`fw_kdprintf_limit`
	`fw_log_bufsize`
	`send_buf_limit`

String	`simple_debug_filter_addr_1`
	`simple_debug_filter_daddr_1`
	`simple_debug_filter_vpn_1`
	`ws_debug_ip_str`
	`fw_lsp_pair1`

Working with Integer Kernel Parameters

Viewing the list of the available Firewall *integer* kernel parameters and their values

Step	Instructions
1	Connect to the command line on your Security Gateway / each Cluster Member. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.
2	Log in to the Expert mode.
3	Make sure you can get the list of the available integer kernel parameters and their values without errors: **Note** - The configuration of your Security Gateway might not support all kernel parameters. As a result, the Security Gateway might fail to get the value of some kernel parameters. `(for PARAMETER in $(modinfo -p $FWDIR/boot/modules/fw_kern*.o | sort -u | grep -E ':int|:uint|:ulong' | awk 'BEGIN {FS=":"} ; {print $1}') ; do echo '' ; echo ---------- ; echo ${PARAMETER} ; echo ---------- ; fw ctl get int ${PARAMETER} -a ; done) 1>>/var/log/fw_vpn_kernel_parameters_integer.txt 2>>/var/log/fw_vpn_kernel_parameters_integer.txt`
4	Analyze these output file: `/var/log//var/log/fw_vpn_kernel_parameters_integer.txt` **Note** - Ignore the error "`PPAK 0: Get failed`". It means SecureXL does not support this specific kernel parameter.

Viewing the current value of a Firewall *integer* kernel parameter

Step	Instructions
1	Connect to the command line on your Security Gateway / each Cluster Member. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.
2	Log in to Gaia Clish or the Expert mode. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must use Gaia gClish or the Expert mode.

3	Get the current value of an integer kernel parameter:
	■ On the Security Gateway / each Cluster Member, run in Gaia Clish or the Expert mode:
	`fw ctl get int <Name of Integer Kernel Parameter> [-a]`
	■ On the Scalable Platform Security Group, run in Gaia gClish:
	`fw ctl get int <Name of Integer Kernel Parameter> [-a]`
	■ On the Scalable Platform Security Group, run in the Expert mode:
	`g_fw ctl get int <Name of Integer Kernel Parameter> [-a]`
	Example:
	`[Expert@MyGW:0]# fw ctl get int send_buf_limit`
	`send_buf_limit = 80`
	`[Expert@MyGW:0]#`

Configuring a value for a Firewall *integer* kernel parameter *temporarily*

Important - This change does **not** survive reboot.

Step	Instructions
1	Connect to the command line on your Security Gateway / each Cluster Member. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.
2	Log in to Gaia Clish or the Expert mode. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must use Gaia gClish or the Expert mode.

3	Configure the new value for an integer kernel parameter:
	■ On a Security Gateway / each Cluster Member, run in Gaia Clish or the Expert mode:
	`fw ctl set int <Name of Integer Kernel Parameter> <Integer Value>`
	■ On a Scalable Platform Security Group, run in Gaia gClish:
	`fw ctl set int <Name of Integer Kernel Parameter> <Integer Value>`
	■ On a Scalable Platform Security Group, run in the Expert mode:
	`g_fw ctl set int <Name of Integer Kernel Parameter> <Integer Value>`
	Example:
	`[Expert@MyGW:0]# fw ctl set int send_buf_limit 100`
	`Set operation succeeded`
	`[Expert@MyGW:0]#`

Step	Instructions

4	Make sure the new value is configured.
	■ On a Security Gateway / each Cluster Member, run in Gaia Clish or the Expert mode:
	`fw ctl get int <Name of Integer Kernel Parameter>`
	■ On a Scalable Platform Security Group, run in Gaia gClish:
	`fw ctl get int <Name of Integer Kernel Parameter>`
	■ On a Scalable Platform Security Group, run in the Expert mode:
	`g_fw ctl get int <Name of Integer Kernel Parameter>`
	Example:
	`[Expert@MyGW:0]# fw ctl get int send_buf_limit`
	`send_buf_limit = 100`
	`[Expert@MyGW:0]#`

Configuring a value for a Firewall *integer* kernel parameter *permanently*

To make a kernel parameter configuration permanent (to survive reboot), you must edit the configuration file:

```
$FWDIR/boot/modules/fwkern.conf
```

The exact parameters appear in various SK articles in *Check Point Support Center*, and provided by *Check Point Support*.

Short procedure for the "fwkern.conf" file

Step	Instructions
1	Connect to the command line on your Security Gateway / each Cluster Member. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.
2	Log in to the Expert mode.

3	Back up the current configuration file, if it exists:
	■ On the Security Gateway (each Cluster Member), run:
	`cp -v $FWDIR/boot/modules/fwkern.conf{,_BKP}`
	■ On the Scalable Platform Security Group, run:
	`g_all cp -v $FWDIR/boot/modules/fwkern.conf{,_BKP}`

Step	Instructions

4	Configure the required Firewall kernel parameter with the assigned value in the exact format specified below.
	■ On the Security Gateway (each Cluster Member), run:
	`fw ctl set -f int <Name_of_Integer_Kernel_Parameter> <Integer_Value>`
	■ On the Scalable Platform Security Group, run **one** of these commands:
	`g_fw ctl set -f int <Name_of_Integer_Kernel_Parameter> <Integer_Value>`
	`g_update_conf_file fwkern.conf <Name_of_Integer_Kernel_Parameter>=<Integer_Value>`
	Example:
	`[Expert@MyGW:0]# fw ctl set -f int send_buf_limit 100`
	`"fwkern.conf" was updated successfully`
	`[Expert@MyGW:0]#`
	`[Expert@MyGW:0]# g_update_conf_file fwkern.conf send_buf_limit=100`
	`"fwkern.conf" was updated successfully`
	`[Expert@MyGW:0]#`

5	Examine the configuration file.
	■ On the Security Gateway (each Cluster Member), run:
	`cat $FWDIR/boot/modules/fwkern.conf`
	■ On the Scalable Platform Security Group, run:
	`g_allc cat $FWDIR/boot/modules/fwkern.conf`

6	Reboot.
	■ On the Security Gateway / Cluster Member, run:
	`reboot`
	Important - In cluster, this can cause a failover.
	■ On the Scalable Platform Security Group, run:
	`g_reboot -a`

Step	Instructions
7	Connect to the command line on your Security Gateway / each Cluster Member. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.
8	Log in to Gaia Clish or the Expert mode. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must use Gaia gClish or the Expert mode.

9	Make sure the new value of the kernel parameter is configured.
	■ On a Security Gateway / each Cluster Member, run:
	`fw ctl get int <Name of Integer Kernel Parameter> [-a]`
	■ On a Scalable Platform Security Group, run:
	`g_fw ctl get int <Name of Integer Kernel Parameter> [-a]`

Long procedure for the "fwkern.conf" file

For more information, see sk26202: Changing the kernel global parameters for Check Point Security Gateway.

Step	Instructions
1	Connect to the command line on your Security Gateway / each Cluster Member. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.
2	Log in to the Expert mode.

3	See if the configuration file already exists.
	■ On a Security Gateway / each Cluster Member:
	`ls -l $FWDIR/boot/modules/fwkern.conf`
	■ On a Scalable Platform Security Group:
	`g_allc ls -l $FWDIR/boot/modules/fwkern.conf`

Step	Instructions

4	If this file already exists, skip to **Step 5**.
	If this file does not exist, then create it manually and then skip to **Step 6**.
	■ On a Security Gateway / each Cluster Member:
	`touch $FWDIR/boot/modules/fwkern.conf`
	■ On a Scalable Platform Security Group:
	`g_all touch $FWDIR/boot/modules/fwkern.conf`

5	Back up the current configuration file.
	■ On a Security Gateway / each Cluster Member:
	`cp -v $FWDIR/boot/modules/fwkern.conf{,_BKP}`
	■ On a Scalable Platform Security Group:
	`g_all cp -v $FWDIR/boot/modules/fwkern.conf{,_BKP}`

6	Edit the current configuration file. The same syntax applies to the Security Gateway / each Cluster Member and the Scalable Platform Security Group: `vi $FWDIR/boot/modules/fwkern.conf`
7	Add the required Firewall kernel parameter with the assigned value in the exact format specified below. **Important** - These configuration files do not support space characters, tabulation characters, and comments (lines that contain the # character). `<Name_of_Integer_Kernel_Parameter>=<Integer_Value>`
8	Save the changes in the file and exit the editor.
9	On the Scalable Platform Security Group, copy the updated configuration file to all other Security Group Members: `asg_cp2blades $FWDIR/boot/modules/fwkern.conf`

Step	Instructions

10	Reboot.
	■ On the Security Gateway / Cluster Member, run:
	`reboot`
	Important - In cluster, this can cause a failover.
	■ On the Scalable Platform Security Group, run:
	`g_reboot -a`

11	Connect to the command line on your Security Gateway / each Cluster Member. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.
12	Log in to Gaia Clish or the Expert mode. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must use Gaia gClish or the Expert mode.

13	Make sure the new value of the kernel parameter is configured.
	■ On a Security Gateway / each Cluster Member, run in Gaia Clish or the Expert mode:
	`fw ctl get int <Name of Integer Kernel Parameter> [-a]`
	■ On a Scalable Platform Security Group, run in Gaia gClish:
	`fw ctl get int <Name of Integer Kernel Parameter> [-a]`
	■ On a Scalable Platform Security Group, run in the Expert mode:
	`g_fw ctl get int <Name of Integer Kernel Parameter> [-a]`

Working with String Kernel Parameters

Viewing the list of the available Firewall *string* kernel parameters and their values

Step	Instructions
1	Connect to the command line on your Security Gateway / each Cluster Member. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.
2	Log in to the Expert mode.
3	Make sure you can get the list of the available integer kernel parameters and their values without errors: **Note** - The configuration of your Security Gateway might not support all kernel parameters. As a result, the Security Gateway might fail to get the value of some kernel parameters. `(for PARAMETER in $(modinfo -p $FWDIR/boot/modules/fw_kern*.o | sort -u | grep ':string' | awk 'BEGIN {FS=":"} ; {print $1}') ; do echo '' ; echo ---------- ---------- ; echo ${PARAMETER} ; echo ---------- ; fw ctl get str ${PARAMETER} -a ; done) 1>>/var/log/fw_vpn_kernel_parameters_string.txt 2>>/var/log/fw_vpn_kernel_parameters_string.txt`
4	Analyze the output file: `/var/log/fw_vpn_kernel_parameters_string.txt` **Note** - Ignore the error "`PPAK 0: Get failed`". It means SecureXL does not support this specific kernel parameter.

Viewing the current value of a Firewall *string* kernel parameter

Step	Instructions
1	Connect to the command line on your Security Gateway / each Cluster Member. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.
2	Log in to Gaia Clish or the Expert mode. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must use Gaia gClish or the Expert mode.

3	Get the current value of a string kernel parameter:
	■ On the Security Gateway / each Cluster Member, run in Gaia Clish or the Expert mode:
	`fw ctl get str <Name of String Kernel Parameter> [-a]`
	■ On the Scalable Platform Security Group, run in Gaia gClish:
	`fw ctl get str <Name of String Kernel Parameter> [-a]`
	■ On the Scalable Platform Security Group, run in the Expert mode:
	`g_fw ctl get str <Name of String Kernel Parameter> [-a]`
	Example:
	`[Expert@MyGW:0]# fw ctl get str fileapp_default_encoding_charset`
	`fileapp_default_encoding_charset = 'UTF-8'`
	`[Expert@MyGW:0]#`

Configuring a value for a Firewall *string* kernel parameter *temporarily*

Important - This change does **not** survive reboot.

Step	Instructions
1	Connect to the command line on your Security Gateway / each Cluster Member. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.
2	Log in to Gaia Clish or the Expert mode. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must use Gaia gClish or the Expert mode.

Step	Instructions

3	Configure the new value for a string kernel parameter.
	Note - You must write the value in single quotes, or double quotes. Use **one** of these syntax options.
	■ On a Security Gateway / each Cluster Member, run in Gaia Clish or the Expert mode:
	`fw ctl set str <Name of String Kernel Parameter> '<String Text>'`
	or
	`fw ctl set str <Name of String Kernel Parameter> "<String Text>"`
	■ On a Scalable Platform Security Group, run in Gaia gClish:
	`fw ctl set str <Name of String Kernel Parameter> '<String Text>'`
	or
	`fw ctl set str <Name of String Kernel Parameter> "<String Text>"`
	■ On a Scalable Platform Security Group, run in the Expert mode:
	`g_fw ctl set str <Name of String Kernel Parameter> '<String Text>'`
	or
	`g_fw ctl set str <Name of String Kernel Parameter> "<String Text>"`
	Example:
	`[Expert@MyGW:0]# fw ctl set str debug_filter_saddr_ip '1.1.1.1'`
	`Set operation succeeded`
	`[Expert@MyGW:0]#`

Step	Instructions

4	Make sure the new value is configured.
	■ On a Security Gateway / each Cluster Member, run in Gaia Clish or the Expert mode:
	`fw ctl get str <Name of String Kernel Parameter>`
	■ On a Scalable Platform Security Group, run in Gaia gClish:
	`fw ctl get str <Name of String Kernel Parameter>`
	■ On a Scalable Platform Security Group, run in the Expert mode:
	`g_fw ctl get str <Name of String Kernel Parameter>`
	Example:
	`[Expert@MyGW:0]# fw ctl get str debug_filter_saddr_ip`
	`debug_filter_saddr_ip = '1.1.1.1'`
	`[Expert@MyGW:0]#`

Configuring a value for a Firewall *string* kernel parameter *permanently*

To make a kernel parameter configuration permanent (to survive reboot), you must edit one of the applicable configuration file:

```
$FWDIR/boot/modules/fwkern.conf
```

The exact parameters appear in various SK articles in *Check Point Support Center*, and provided by *Check Point Support*.

Short procedure for the "fwkern.conf" file

Step	Instructions
1	Connect to the command line on your Security Gateway / each Cluster Member. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.
2	Log in to the Expert mode.

3	Back up the current configuration file, if it exists:
	■ On the Security Gateway (each Cluster Member), run:
	`cp -v $FWDIR/boot/modules/fwkern.conf{,_BKP}`
	■ On the Scalable Platform Security Group, run:
	`g_all cp -v $FWDIR/boot/modules/fwkern.conf{,_BKP}`

Step	Instructions

4	Configure the required Firewall kernel parameter with the assigned value in the exact format specified below.
	Note - You must write the value in single quotes, or double quotes. Use **one** of these syntax options.
	■ On a Security Gateway / each Cluster Member, run in Gaia Clish or the Expert mode:
	`fw ctl set -f str <Name_of_String_Kernel_Parameter> '<String_Text>'`
	or
	`fw ctl set -f str <Name_of_String_Kernel_Parameter> "<String_Text>"`
	■ On a Scalable Platform Security Group, run in the Expert mode:
	`g_fw ctl set -f str <Name_of_String_Kernel_Parameter> '<String_Text>'`
	or
	`g_fw ctl set -f str <Name_of_String_Kernel_Parameter> "<String_Text>"`
	Example:
	`[Expert@MyGW:0]# fw ctl set -f str ws_debug_ip_str '1.1.1.1'`
	`"fwkern.conf" was updated successfully`
	`[Expert@MyGW:0]#`

5	Examine the configuration file.
	■ On the Security Gateway / each Cluster Member, run:
	`cat $FWDIR/boot/modules/fwkern.conf`
	■ On the Scalable Platform Security Group, run:
	`g_allc cat $FWDIR/boot/modules/fwkern.conf`

Step	Instructions

6	Reboot.
	■ On the Security Gateway / Cluster Member, run:
	`reboot`
	Important - In cluster, this can cause a failover.
	■ On the Scalable Platform Security Group, run:
	`g_reboot -a`

7	Connect to the command line on your Security Gateway / each Cluster Member. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.
8	Log in to Gaia Clish or the Expert mode. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must use Gaia gClish or the Expert mode.

9	Make sure the new value of the kernel parameter is configured.
	■ On a Security Gateway / each Cluster Member, run in Gaia Clish or the Expert mode:
	`fw ctl get str <Name of String Kernel Parameter> [-a]`
	■ On a Scalable Platform Security Group, run in Gaia gClish:
	`fw ctl get str <Name of String Kernel Parameter> [-a]`
	■ On a Scalable Platform Security Group, run in the Expert mode:
	`g_fw ctl get str <Name of String Kernel Parameter> [-a]`

Long procedure for the "fwkern.conf" file

For more information, see sk26202: Changing the kernel global parameters for Check Point Security Gateway.

Step	Instructions
1	Connect to the command line on your Security Gateway / each Cluster Member. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.
2	Log in to the Expert mode.

3	See if the configuration file already exists.
	■ On a Security Gateway / each Cluster Member:
	`ls -l $FWDIR/boot/modules/fwkern.conf`
	■ On a Scalable Platform Security Group:
	`g_all ls -l $FWDIR/boot/modules/fwkern.conf`

4	If this file already exists, skip to **Step 5**.
	If this file does not exist, then create it manually and then skip to **Step 6**.
	■ On a Security Gateway / each Cluster Member:
	`touch $FWDIR/boot/modules/fwkern.conf`
	■ On a Scalable Platform Security Group:
	`g_all touch $FWDIR/boot/modules/fwkern.conf`

5	Back up the current configuration file.
	■ On a Security Gateway / each Cluster Member:
	`cp -v $FWDIR/boot/modules/fwkern.conf{,_BKP}`
	■ On a Scalable Platform Security Group:
	`g_all cp -v $FWDIR/boot/modules/fwkern.conf{,_BKP}`

6	Edit the current configuration file. The same syntax applies to the Security Gateway / each Cluster Member and the Scalable Platform Security Group: `vi $FWDIR/boot/modules/fwkern.conf`

Step	Instructions

7	Add the required kernel parameter with the assigned value in the exact format specified below.
	Important - These configuration files do not support space characters, tabulation characters, and comments (lines that contain the # character).
	Note - You must write the value in single quotes, or double quotes. Use **one** of these syntax options.
	`<Name_of_String_Kernel_Parameter>='<String_Text>'`
	or
	`<Name_of_String_Kernel_Parameter>="<String_Text>"`

8	Save the changes in the file and exit the editor.
9	On the Scalable Platform Security Group, copy the updated configuration file to all other Security Group Members: `asg_cp2blades $FWDIR/boot/modules/fwkern.conf`

10	Reboot.
	■ On the Security Gateway / Cluster Member, run:
	`reboot`
	Important - In cluster, this can cause a failover.
	■ On the Scalable Platform Security Group, run:
	`g_reboot -a`

11	Connect to the command line on your Security Gateway / each Cluster Member. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.
12	Log in to Gaia Clish or the Expert mode. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must use Gaia gClish or the Expert mode.

Step	Instructions

13	Make sure the new value of the kernel parameter is configured.
	■ On a Security Gateway / each Cluster Member, run in Gaia Clish or the Expert mode:
	`fw ctl get str <Name of String Kernel Parameter> [-a]`
	■ On a Scalable Platform Security Group, run in Gaia gClish:
	`fw ctl get str <Name of String Kernel Parameter> [-a]`
	■ On a Scalable Platform Security Group, run in the Expert mode:
	`g_fw ctl get str <Name of String Kernel Parameter> [-a]`

Removing the current value from a Firewall *string* kernel parameter *temporarily*

Important - This change does **not** survive reboot.

Step	Instructions
1	Connect to the command line on your Security Gateway or Cluster Member. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.
2	Log in to Gaia Clish or the Expert mode. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must use Gaia gClish or the Expert mode.

3	Clear the current value from a string kernel parameter:
	Note - You must set an empty value in single quotes, or double quotes. Use **one** of these syntax options.
	■ On a Security Gateway / each Cluster Member, run in Gaia Clish or the Expert mode:
	`fw ctl set str '<Name of String Kernel Parameter>'`
	or
	`fw ctl set str "<Name of String Kernel Parameter>"`
	■ On a Scalable Platform Security Group, run in Gaia gClish:
	`fw ctl set str '<Name of String Kernel Parameter>'`
	or
	`fw ctl set str "<Name of String Kernel Parameter>"`
	■ On a Scalable Platform Security Group, run in the Expert mode:
	`g_fw ctl set str '<Name of String Kernel Parameter>'`
	or
	`g_fw ctl set str "<Name of String Kernel Parameter>"`
	Example:
	`[Expert@MyGW:0]# fw ctl set str debug_filter_saddr_ip ''`
	`Set operation succeeded`
	`[Expert@MyGW:0]#`

Step	Instructions

4	Make sure the value is cleared (the new value is empty):
	■ On a Security Gateway / each Cluster Member, run in Gaia Clish or the Expert mode:
	`fw ctl get str <Name of String Kernel Parameter>`
	■ On a Scalable Platform Security Group, run in Gaia gClish:
	`fw ctl get str <Name of String Kernel Parameter>`
	■ On a Scalable Platform Security Group, run in the Expert mode:
	`g_fw ctl get str <Name of String Kernel Parameter>`
	Example:
	`[Expert@MyGW:0]# fw ctl get str debug_filter_saddr_ip`
	`debug_filter_saddr_ip = ''`
	`[Expert@MyGW:0]#`

SecureXL Kernel Parameters

To change the internal default behavior of SecureXL or to configure special advanced settings for SecureXL, you can use SecureXL kernel parameters.

The names of applicable SecureXL kernel parameters and their values appear in various SK articles in *Check Point Support Center*, and provided by *Check Point Support*.

Important:

- The names of SecureXL kernel parameters are case-sensitive.
- You can configure SecureXL kernel parameters in the current session with the "`fw ctl set`" command.
  This change does **not** survive reboot.
- To configure SecureXL kernel parameters permanently, you must configure them in the special configuration file - `$PPKDIR/conf/simkern.conf`
  Schedule a maintenance window, because this procedure requires a reboot.
- For some SecureXL kernel parameters, you **cannot** get their current value on-the-fly with the "`fw ctl get`" command (see sk43387).
- In a Cluster, you must configure all the Cluster Members in the same way.
- On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.

Examples of SecureXL kernel parameters

Type	Name

Integer	`num_of_sxl_devices`
	`sim_ipsec_dont_fragment`
	`tcp_always_keepalive`
	`sim_log_all_frags`
	`simple_debug_filter_dport_1`
	`simple_debug_filter_proto_1`

String	`simple_debug_filter_addr_1`
	`simple_debug_filter_daddr_2`
	`simlinux_excluded_ifs_list`

Working with Integer Kernel Parameters

Viewing the list of the available SecureXL *integer* kernel parameters and their values

Step	Instructions
1	Connect to the command line on your Security Gateway / each Cluster Member. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.
2	Log in to the Expert mode.
3	Make sure you can get the list of the available integer kernel parameters and their values without errors: **Note** - The configuration of your Security Gateway might not support all kernel parameters. As a result, the Security Gateway might fail to get the value of some kernel parameters. `(for PARAMETER in $(modinfo -p $PPKDIR/boot/modules/sim_kern*.o | sort -u | grep -E ':int|:uint|:ulong' | awk 'BEGIN {FS=":"} ; {print $1}') ; do echo '' ; echo ------------------------------ ; echo ${PARAMETER} ; echo ------------------------------ ; fw ctl get int ${PARAMETER} -a ; done) 1>>/var/log/sxl_kernel_parameters_integer.txt 2>>/var/log/sxl_kernel_parameters_integer.txt`
4	Analyze the output file: `/var/log/sxl_kernel_parameters_integer.txt`

Viewing the current value of a SecureXL *integer* kernel parameter

Step	Instructions
1	Connect to the command line on your Security Gateway / each Cluster Member. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.
2	Log in to Gaia Clish or the Expert mode. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must use Gaia gClish or the Expert mode.

3	Get the current value of an integer kernel parameter:
	■ On the Security Gateway / each Cluster Member, run in Gaia Clish or the Expert mode:
	`fw ctl get int <Name of Integer Kernel Parameter> [-a]`
	■ On the Scalable Platform Security Group, run in Gaia gClish:
	`fw ctl get int <Name of Integer Kernel Parameter> [-a]`
	■ On the Scalable Platform Security Group, run in the Expert mode:
	`g_fw ctl get int <Name of Integer Kernel Parameter> [-a]`
	Example:
	`[Expert@MyGW:0]# fw ctl get int sim_ipsec_dont_fragment`
	`sim_ipsec_dont_fragment = 1`
	`[Expert@MyGW:0]#`

Configuring a value for a SecureXL *integer* kernel parameter *temporarily*

Important - This change does **not** survive reboot.

Step	Instructions
1	Connect to the command line on your Security Gateway / each Cluster Member. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.
2	Log in to Gaia Clish or the Expert mode. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must use Gaia gClish or the Expert mode.

3	Configure the new value for an integer kernel parameter:
	■ On a Security Gateway / each Cluster Member, run in Gaia Clish or the Expert mode:
	`fw ctl set int <Name of Integer Kernel Parameter> <Integer Value>`
	■ On a Scalable Platform Security Group, run in Gaia gClish:
	`fw ctl set int <Name of Integer Kernel Parameter> <Integer Value>`
	■ On a Scalable Platform Security Group, run in the Expert mode:
	`g_fw ctl set int <Name of Integer Kernel Parameter> <Integer Value>`
	Example:
	`[Expert@MyGW:0]# fw ctl set int sim_ipsec_dont_fragment 0`
	`Set operation succeeded`
	`[Expert@MyGW:0]#`

Step	Instructions

4	Make sure the new value is configured.
	■ On a Security Gateway / each Cluster Member, run in Gaia Clish or the Expert mode:
	`fw ctl get int <Name of Integer Kernel Parameter>`
	■ On a Scalable Platform Security Group, run in Gaia gClish:
	`fw ctl get int <Name of Integer Kernel Parameter>`
	■ On a Scalable Platform Security Group, run in the Expert mode:
	`g_fw ctl get int <Name of Integer Kernel Parameter>`
	Example:
	`[Expert@MyGW:0]# fw ctl get int sim_ipsec_dont_fragment`
	`sim_ipsec_dont_fragment = 0`
	`[Expert@MyGW:0]#`

Configuring a value for a SecureXL *integer* kernel parameter *permanently*

Step	Instructions
1	Connect to the command line on your Security Gateway / each Cluster Member. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.
2	Log in to the Expert mode.

3	See if the configuration file already exists.
	■ On a Security Gateway / each Cluster Member, run:
	`ls -l $PPKDIR/conf/simkern.conf`
	■ On a Scalable Platform Security Group, run:
	`g_ls -l $PPKDIR/conf/simkern.conf`

4	If this file already exists, skip to **Step 5**.
	If this file does not exist, then create it manually and then skip to **Step 6**:
	■ On a Security Gateway / each Cluster Member, run:
	`touch $PPKDIR/conf/simkern.conf`
	■ On a Scalable Platform Security Group, run:
	`g_all touch $PPKDIR/conf/simkern.conf`

5	Back up the current configuration file.
	■ On a Security Gateway / each Cluster Member, run:
	`cp -v $PPKDIR/conf/simkern.conf{,_BKP}`
	■ On a Scalable Platform Security Group, run:
	`g_cp -v $PPKDIR/conf/simkern.conf{,_BKP}`

6	Edit the current configuration file. The same syntax applies to the Security Gateway / each Cluster Member and the Scalable Platform Security Group: `vi $PPKDIR/conf/simkern.conf`

Step	Instructions
7	Add the required SecureXL kernel parameter with the assigned value in the exact format specified below. **Important** - This configuration file does not support space characters, tabulation characters, and comments (lines that contain the # character). `<Name_of_SecureXL_Integer_Kernel_Parameter>=<Integer_Value>`
8	Save the changes in the file and exit the editor.

9	Reboot.
	■ On the Security Gateway / Cluster Member, run:
	`reboot`
	Important - In cluster, this can cause a failover.
	■ On the Scalable Platform Security Group, run:
	`g_reboot -a`

10	Connect to the command line on your Security Gateway / each Cluster Member. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.
11	Log in to Gaia Clish or the Expert mode. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must use Gaia gClish or the Expert mode.

12	Make sure the new value of the kernel parameter is configured.
	■ On a Security Gateway / each Cluster Member, run in Gaia Clish or the Expert mode:
	`fw ctl get int <Name of Integer Kernel Parameter> [-a]`
	■ On a Scalable Platform Security Group, run in Gaia gClish:
	`fw ctl get int <Name of Integer Kernel Parameter> [-a]`
	■ On a Scalable Platform Security Group, run in the Expert mode:
	`g_fw ctl get int <Name of Integer Kernel Parameter> [-a]`

Working with String Kernel Parameters

Viewing the list of the available SecureXL *string* kernel parameters and their values

Step	Instructions
1	Connect to the command line on your Security Gateway / each Cluster Member. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.
2	Log in to the Expert mode.
3	Make sure you can get the list of the available integer kernel parameters and their values without errors: **Note** - The configuration of your Security Gateway might not support all kernel parameters. As a result, the Security Gateway might fail to get the value of some kernel parameters. `(for PARAMETER in $(modinfo -p $PPKDIR/boot/modules/sim_kern*.o | sort -u | grep ':string' | awk 'BEGIN {FS=":"} ; {print $1}') ; do echo '' ; echo ---------- ; echo ${PARAMETER} ; echo ---------- ; fw ctl get str ${PARAMETER} -a ; done) 1>>/var/log/sxl_kernel_parameters_string.txt 2>>/var/log/sxl_kernel_parameters_string.txt`
4	Analyze the output file: `/var/log/sxl_kernel_parameters_string.txt`

Viewing the current value of a SecureXL *string* kernel parameter

Step	Instructions
1	Connect to the command line on your Security Gateway / each Cluster Member. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.
2	Log in to Gaia Clish or the Expert mode. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must use Gaia gClish or the Expert mode.

3	Get the current value of an integer kernel parameter:
	■ On the Security Gateway / each Cluster Member, run in Gaia Clish or the Expert mode:
	`fw ctl get str <Name of Integer Kernel Parameter> [-a]`
	■ On the Scalable Platform Security Group, run in Gaia gClish:
	`fw ctl get str <Name of Integer Kernel Parameter> [-a]`
	■ On the Scalable Platform Security Group, run in the Expert mode:
	`g_fw ctl get str <Name of Integer Kernel Parameter> [-a]`
	Example:
	`[Expert@MyGW:0]# fw ctl get str fwkdebug_print_connkey_on_str`
	`fwkdebug_print_connkey_on_str = ''`
	`[Expert@MyGW:0]#`

Configuring a value for a SecureXL *string* kernel parameter *temporarily*

Important - This change does **not** survive reboot.

Step	Instructions
1	Connect to the command line on your Security Gateway / each Cluster Member. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.
2	Log in to Gaia Clish or the Expert mode. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must use Gaia gClish or the Expert mode.

3	Configure the new value for a string kernel parameter.
	Note - You must write the value in single quotes, or double quotes. Use **one** of these syntax options.
	■ On a Security Gateway / each Cluster Member, run in Gaia Clish or the Expert mode:
	`fw ctl set str <Name of String Kernel Parameter> '<String Text>'`
	or
	`fw ctl set str <Name of String Kernel Parameter> "<String Text>"`
	■ On a Scalable Platform Security Group, run in Gaia gClish:
	`fw ctl set str <Name of String Kernel Parameter> '<String Text>'`
	or
	`fw ctl set str <Name of String Kernel Parameter> "<String Text>"`
	■ On a Scalable Platform Security Group, run in the Expert mode:
	`g_fw ctl set str <Name of String Kernel Parameter> '<String Text>'`
	or
	`g_fw ctl set str <Name of String Kernel Parameter> "<String Text>"`
	Example:
	`[Expert@MyGW:0]# fw ctl set str fwkdebug_print_connkey_on_str 'Packet accepted'`
	`Set operation succeeded`
	`[Expert@MyGW:0]#`

Step	Instructions

4	Make sure the new value is configured.
	■ On a Security Gateway / each Cluster Member, run in Gaia Clish or the Expert mode:
	`fw ctl get str <Name of String Kernel Parameter>`
	■ On a Scalable Platform Security Group, run in Gaia gClish:
	`fw ctl get str <Name of String Kernel Parameter>`
	■ On a Scalable Platform Security Group, run in the Expert mode:
	`g_fw ctl get str <Name of String Kernel Parameter>`
	Example:
	`[Expert@MyGW:0]# fw ctl get str fwkdebug_print_connkey_on_str`
	`fwkdebug_print_connkey_on_str = 'Packet accepted'`
	`[Expert@MyGW:0]#`

Configuring a value for a SecureXL *string* kernel parameter *permanently*

Step	Instructions
1	Connect to the command line on your Security Gateway / each Cluster Member. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.
2	Log in to the Expert mode.

3	See if the configuration file already exists.
	■ On a Security Gateway / each Cluster Member, run:
	`ls -l $PPKDIR/conf/simkern.conf`
	■ On a Scalable Platform Security Group, run:
	`g_ls -l $PPKDIR/conf/simkern.conf`

4	If this file already exists, skip to **Step 5**.
	If this file does not exist, then create it manually and then skip to **Step 6**:
	■ On a Security Gateway / each Cluster Member, run:
	`touch $PPKDIR/conf/simkern.conf`
	■ On a Scalable Platform Security Group, run:
	`g_all touch $PPKDIR/conf/simkern.conf`

5	Back up the current configuration file.
	■ On a Security Gateway / each Cluster Member, run:
	`cp -v $PPKDIR/conf/simkern.conf{,_BKP}`
	■ On a Scalable Platform Security Group, run:
	`g_cp -v $PPKDIR/conf/simkern.conf{,_BKP}`

6	Edit the current configuration file. The same syntax applies to the Security Gateway / each Cluster Member and the Scalable Platform Security Group: `vi $PPKDIR/conf/simkern.conf`

Step	Instructions

7	Add the required SecureXL kernel parameter with the assigned value in the exact format specified below.
	Important - This configuration file does not support space characters, tabulation characters, and comments (lines that contain the # character).
	Note - You must write the value in single quotes, or double quotes. Use **one** of these syntax options.
	`<Name_of_SecureXL_String_Kernel_Parameter>='<String_Text>'`
	or
	`<Name_of_SecureXL_String_Kernel_Parameter>="<String_Text>"`

8	Save the changes in the file and exit the editor.

9	Reboot.
	■ On the Security Gateway / Cluster Member, run:
	`reboot`
	Important - In cluster, this can cause a failover.
	■ On the Scalable Platform Security Group, run:
	`g_reboot -a`

10	Connect to the command line on your Security Gateway / each Cluster Member. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.
11	Log in to Gaia Clish or the Expert mode. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must use Gaia gClish or the Expert mode.

Step	Instructions

12	Make sure the new value of the kernel parameter is configured.
	■ On a Security Gateway / each Cluster Member, run in Gaia Clish or the Expert mode:
	`fw ctl get str <Name of String Kernel Parameter> [-a]`
	■ On a Scalable Platform Security Group, run in Gaia gClish:
	`fw ctl get str <Name of String Kernel Parameter> [-a]`
	■ On a Scalable Platform Security Group, run in the Expert mode:
	`g_fw ctl get str <Name of String Kernel Parameter> [-a]`

Kernel Debug

This section describes how to collect a kernel debug on a Security Gateway, ClusterXL Cluster Members, or Scalable Platform Security Group.

Kernel Debug Syntax

Description

During a kernel debug session, Security Gateway / Cluster Member / Scalable Platform Security Group Member prints special debug messages that help Check Point Support and R&D understand how it processes the applicable connections.

Important:

- In Cluster, you must configure and perform the kernel debug procedure on all cluster members in the same way.
- On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.

Action Plan to Collect a Kernel Debug

Note - See the *"Kernel Debug Procedure" on page 335*, or the *"Kernel Debug Procedure with Connection Life Cycle" on page 343*.

Step	Action	Instructions
1	Configure the applicable debug settings: a. Restore the default settings. b. Allocate the debug buffer.	In this step, you prepare the kernel debug options: a. Restore the default debug settings, so that any other debug settings do not interfere with the kernel debug. b. Allocate the kernel debug buffer, in which Security Gateway / Cluster Member / each Security Group Member holds the applicable debug messages.
2	Configure the applicable kernel debug modules and their debug flags.	In this step, you prepare the applicable kernel debug modules and their debug flags, so that Security Gateway / Cluster Member / each Security Group Member collects only applicable debug messages.
3	Start the collection of the kernel debug into an output file.	In this step, you configure Security Gateway / Cluster Member / each Security Group Member to write the debug messages from the kernel debug buffer into an output file.
4	Stop the kernel debug.	In this step, you configure Security Gateway / Cluster Member / each Security Group Member to stop writing the debug messages into an output file.

Step	Action	Instructions
5	Restore the default kernel debug settings.	In this step, you restore the default kernel debug options.

Kernel Debug Behavior on Security Gateways with 72 and more CPU Cores

When you enable the kernel debug, all CoreXL Firewall instances on a Security Gateway start to print their applicable debug messages.

To present the complete chronological overview, the Security Gateway performs real-time merge of these debug messages in RAM.

The more CPU cores the Security Gateway has, the more CPU and RAM resources this real-time merge consumes.

Therefore, starting in R82, by default, the kernel debug behaves differently on Security Gateways with 72 and more CPU cores:

When you run the kernel debug without redirecting the output to a file

This is the comparison of the kernel debug behavior of the "`fw ctl kdebug -T`" command when you do **not** redirect the debug output to a file:

New Kernel Debug Behavior on Security Gateways with 72 and more CPU cores	Legacy Kernel Debug Behavior on Security Gateways with fewer than 72 CPU cores

1. The Security Gateway writes the debug messages to default temporary output files (`/var/log/debug.log*`).
▪ For Firewall:
`/var/log/debug.log`
`/var/log/debug.log.header`
`/var/log/debug.log.kernel`
`/var/log/debug.log.<`*`VS_ID`*`>.<`*`CoreXL_FW_ID`*`>`
▪ For SecureXL in the UPPAK mode:
`/var/log/debug.log.uppak`
2. The Security Gateway does not show any output on the screen in real time.
Note - You can run the "`fw ctl kdebug -T`" command in the background, and run the "`tail -f`" commands on all the temporary debug files.
3. After you stop the kernel debug, the Security Gateway:
a. Performs the merge of all debug messages saved in the temporary output files.
b. Shows the merged output on the screen.
c. Deletes the temporary output files (unless you specify to keep them).
	1. The Security Gateway keeps the debug messages in RAM.
	2. The Security Gateway shows the merged output on the screen in real time.

When you run the kernel debug and redirect the output to a file

This is the comparison of the kernel debug behavior of the "`fw ctl kdebug -T`" command when you redirect the debug output to a file (*`/<Path>/<Name of File>.<Extension of File>`*):

New Kernel Debug Behavior on Security Gateways with 72 and more CPU cores	Legacy Kernel Debug Behavior on Security Gateways with fewer than 72 CPU cores
1. The Security Gateway writes the debug messages to temporary output files (in the same directory of the output file you specified): ▪ For Firewall: *`/<Path>/<Name of File>.<Extension of File>`*`.header` *`/<Path>/<Name of File>.<Extension of File>`*`.kernel` *`/<Path>/<Name of File>.<Extension of File>.<VS_ID>.<CoreXL_FW_ID>`* ▪ For SecureXL in the UPPAK mode: *`/<Path>/<Name of File>.<Extension of File>`*`.uppak` 2. The Security Gateway does not show any output on the screen in real time. Note - You can run the "`fw ctl kdebug -T`" command in the background, and run the "`tail -f`" commands on all the temporary debug files. 3. After you stop the kernel debug, the Security Gateway: a. Performs the merge of all debug messages in the temporary output files. b. Deletes the temporary output files (unless you specify to keep them).	1. The Security Gateway writes the debug messages to the specified output file. 2. The Security Gateway does not show any output on the screen in real time. Note - You can run the "`tail -f`" command on the specified output file.

To use the new kernel debug behavior on Security Gateways with fewer than 72 CPU cores

You can use the new kernel debug behavior on Security Gateways with fewer than 72 CPU cores.

Instead of the "`fw ctl kdebug -T`" command, use the "`fw ctl ndebug -T`" command.

CLI Syntax

When there are differences in the syntax, this section provides the CLI syntax for the new kernel debug (see *"Kernel Debug Behavior on Security Gateways with 72 and more CPU Cores" on page 305*) and the legacy kernel debug.

Notes:

- The syntax below applies to both Gaia Clish / Gaia gClish and the Expert mode.
- The syntax below applies to the Security Gateway, each Cluster Member, and Scalable Platform Security Group.

Important - To run these commands in the Expert mode on a Scalable Platform Security Group, you must use the "`g_fw ctl ...`" command instead of the "`fw ctl ...`" command.

General syntax for the 'fw ctl debug' command (configuring the kernel debug modules and debug flags)

```
fw ctl debug
      [-h]
      [0 | -x]
      [-buf 8200]
      [-v {"<List of VSIDs>" | all} -k]
      [-d "<Strings to Search>"]
      [-s "<String to Stop Debug>"]
      [-F "<Source IP>,<Source Port>,<Dest IP>,<Dest
Port>,<Protocol Number>"]
      [-H "<IP Address>"]
      [-e "<Expression>" | -i {<Path to Filter File> | -} | -u]
      [-z]
      [-U]
      -m <Name of Debug Module> {all | [+|-] <List of Debug
Flags>}
```

General syntax for the 'fw ctl ndebug' command (configuring the new kernel debug output)

```
fw ctl ndebug
      [-h]
      [-v {"<List of VSIDs>" | all} -k]
      [-b <Buffer Size>]
      [-p <List of Fields>]
      [-T | -t]
      [-M]
      [-w]
      [-U]
      [-c <Number of CoreXL Firewall Instances in Debug Thread>]
      [-I {"<List of CoreXL Firewall Instances>" | all}]
      -o /<Path>/<Name of Output File>
```

General syntax for the 'fw ctl kdebug' command (configuring the legacy kernel debug output)

```
fw ctl kdebug
      [-h]
      [-v {"<List of VSIDs>" | all} [-k]]
      [-b <Buffer Size>
      [-p <List of Fields>
      [-T | -t]
      [-f]
      -o /<Path>/<Name of Output File>
            [-m <Number of Cyclic Files>] [-s <Size of Each Cyclic
File in KB>]]
```

CLI syntax to see the built-in help for the kernel debug

- Built-in help for configuring the New Kernel Debug and the Legacy Kernel Debug:

  ```
  fw ctl debug -h
  ```

- Built-in help for output of the New Kernel Debug:

  ```
  fw ctl ndebug -h
  ```

- Built-in help for output of the Legacy Kernel Debug:

  ```
  fw ctl kdebug -h
  ```

CLI syntax to restore the default kernel debug settings

- To reset all debug flags and enable only the default debug flags in all kernel modules:

```
fw ctl debug 0
```

- To disable all debug flags including the default flags in all kernel modules:

  Best Practice - Do **not** run this command, because it disables even the basic default debug messages.
  As a result, the `/var/log/messages` file will not show these basic default debug messages.

```
fw ctl debug -x
```

CLI syntax to allocate the kernel debug buffer

- To allocate the kernel debug buffer in the 'Gateway' mode:

```
fw ctl debug -buf 8200
```

- To allocate the kernel debug buffer in the 'VSX' mode:

```
fw ctl debug -buf 8200 -v {"<List of VSIDs>" | all} -k
```

CLI syntax to allocate the user space debug buffer

The size of the user space debug buffer should be at least the size of the maximum kernel debug buffer of 8200.

Use the "`-b <User Space Buffer Size>`" parameter as part of the syntax.

Note - Security Gateway / Cluster Member / each Security Group Member allocates the user space debug buffer with the specified size for each CoreXL Firewall instance.

- To allocate the user space debug buffer in the New Kernel Debug:

```
fw ctl ndebug -b 8200 <other required parameters>
```

- To allocate the user space debug buffer in the Legacy Kernel Debug:

```
fw ctl kdebug -b 8200 <other required parameters>
```

CLI syntax to configure the debug modules and debug flags

- General syntax:

```
fw ctl debug [-v {"<List of VSIDs>" | all} -k] [-U] [-z] -m
<Name of Debug Module> {all | [+|-] <List of Debug Flags>}
```

- To see a list of all debug modules and their flags:

  Note - The list of kernel modules depends on the Software Blades you enabled on the Security Gateway / ClusterXL / Security Group.

```
fw ctl debug -m
```

- To see a list of debug flags that are already enabled:

```
fw ctl debug
```

- To enable all debug flags in the specified kernel module:

```
fw ctl debug -m <Name of Debug Module> all
```

- To enable only the specified debug flags in the specified kernel module in addition to already enabled debug flags:

```
fw ctl debug -m <Name of Debug Module> + <List of Debug
Flags>
```

- To enable only the specified debug flags in the specified kernel module and disables all other enabled debug flags:

```
fw ctl debug -m <Name of Debug Module> <List of Debug Flags>
```

- To disable only the specified debug flags in the specified kernel module:

```
fw ctl debug -m <Name of Debug Module> - <List of Debug
Flags>
```

CLI syntax to collect the kernel debug output in the 'Gateway' mode

- New Kernel Debug:

```
fw ctl ndebug [-b <User Space Buffer Size>] [-p <List of
Fields>] [-k] -T [-M] [-w] [-U] [-c <Number of CoreXL
Firewall Instances in Debug Thread>] [-I "<List of CoreXL
Firewall Instances>" | all}] -o /<Path>/<Name of Output
File>
```

- Legacy Kernel Debug:

```
fw ctl kdebug [-b <User Space Buffer Size>] [-p <List of
Fields>] [-k] -T -f -o /<Path>/<Name of Output File> [-m
<Number of Cyclic Files> [-s <Size of Each Cyclic File in
KB>]]
```

CLI syntax to collect the kernel debug output in the 'VSNext' / 'Traditional VSX' mode - from specific Virtual Systems

- New Kernel Debug:

```
fw ctl ndebug [-b <User Space Buffer Size>] [-p <List of
Fields>] [-k] -T -v {"<List of VSIDs>" | all} -k [-M] [-w]
[-U] [-c <Number of CoreXL Firewall Instances in Debug
Thread>] [-I {"<List of CoreXL Firewall Instances>" | all}]
-o /<Path>/<Name of Output File>
```

- Legacy Kernel Debug:

```
fw ctl kdebug [-b <User Space Buffer Size>] [-p <List of
Fields>] -v {"<List of VSIDs>" | all} -k -T -f -o
/<Path>/<Name of Output File> [-m <Number of Cyclic Files>
[-s <Size of Each Cyclic File in KB>]]
```

CLI Parameters

CLI Parameters for the 'fw ctl debug' command (for the new kernel debug and the legacy kernel debug)

Note - Only supported parameters are listed.

Table: Parameters of the 'fw ctl debug' command

Parameter	Description
`-h`	Shows the built-in help.

Table: Parameters of the 'fw ctl debug' command (continued)

Parameter	Description
`0` `-x`	Controls how to disable the debug flags: ■ `0` Resets all debug flags and enables only the default debug flags in all kernel modules. ■ `-x` Disables all debug flags, including the default flags in all kernel modules. **Best Practice** - Do **not** use the "`-x`" parameter, because it disables even the basic default debug messages. As a result, the `/var/log/messages` file will not contain this basic useful information.
`-buf 8200`	Allocates the kernel debug buffer. **Notes:** ■ Security Gateway / Cluster Member / each Security Group Member allocates the kernel debug buffer with the specified size for each CoreXL Firewall instance. ■ The maximum supported buffer size is 8192 kilobytes.. ■ If not specified explicitly, the default buffer size is 50 kilobytes. ■ For an approximate total memory utilization, refer to sk160955.

Table: Parameters of the 'fw ctl debug' command (continued)

Parameter	Description
`-v {"<List of VSIDs>" | all} -k`	In the VSNext mode: ■ Specifies the list of Virtual Gateways. ■ A VSNext Gateway automatically filters the collected kernel debug information for debug messages only for these Virtual Gateways. In the Traditional VSX mode: ■ Specifies the list of Virtual Systems. ■ A Traditional VSX Gateway automatically filters the collected kernel debug information for debug messages only for these Virtual Systems. Syntax: ■ `-v "<List of VSIDs>" -k` Monitors the debug messages only from the specified Virtual Gateways / Virtual Systems. To specify the Virtual Gateways / Virtual Systems, enter their VSID number separated with commas and without spaces: `"VSID1[,VSID2,VSID3,...,VSIDn]"` Example: `-v "1,3,7" -k` ■ `-v all -k` Monitors the debug messages from all configured Virtual Gateways / Virtual Systems. **Notes:** ■ To see the ID numbers of Virtual Gateways / Virtual Systems, run: `vsx stat {-v | -l}` ■ This parameter "`-v`" is supported only in VSNext / Traditional VSX mode. ■ When you use this parameter "`-v`", you must also use the parameter "`-k`". When you use this "`-k`" parameter, the kernel debug output also contains the debug messages from kernel components that are not part of any Virtual Gateway / Virtual System, such as SecureXL and CoreXL dispatcher.

Table: Parameters of the 'fw ctl debug' command (continued)

Parameter	Description

`-d "<Strings to Search>"`	When you specify this parameter, the Security Gateway / Cluster Member / Security Group:
	1. Examines the applicable debug messages based on the enabled kernel debug modules and their debug flags.
	2. Collects only debug messages that contain at least one of the strings specified as "`<string>`" into the kernel debug buffer.
	3. Excludes debug messages that contain at least one of the strings specified as "`^<string>`" into the kernel debug buffer.
	4. Writes the entire kernel debug buffer into the output file.
	Notes:
	■ These strings can be any plain text (not a regular expression) that you see in the debug messages.
	■ You can separate the applicable strings by commas without spaces (up to 250 characters in total):
	`-d "String1,String2,...,StringN"`
	■ You can specify each applicable string separately (use this format if a string contains the comma character):
	`-d "String1" -d "String2 ... -d "StringN"`
	■ You can specify strings to exclude from the kernel debug:
	`-d "^String1,^String2,...,^StringN"`
	`-d "^String1" -d "^String2 ... -d "^StringN"`
	■ You can specify up to 10 strings (total for included and excluded strings).

Table: Parameters of the 'fw ctl debug' command (continued)

Parameter	Description
`-s "<String to Stop Debug>"`	When you specify this parameter, the Security Gateway / Cluster Member / Security Group: 1. Collects the applicable debug messages into the kernel debug buffer based on the enabled kernel debug modules and their debug flags. 2. Does not write any of these debug messages from the kernel debug buffer into the output file. 3. Stops collecting all debug messages when it detects the first debug message that contains the specified string in the kernel debug buffer. 4. Writes the entire kernel debug buffer into the output file. **Notes:** ■ This one string can be any plain text (not a regular expression) that you see in the debug messages. ■ String length is up to 50 characters.
`-F "<Source IP>,<Source Port>,<Dest IP>,<Dest Port>,<Protocol Number>"`	Specifies the capture filter (for both accelerated and non-accelerated traffic): ■ `<Source IP>` Specifies the source IP address ■ `<Source Port>` Specifies the source Port Number (see *IANA Service Name and Port Number Registry*) ■ `<Dest IP>` Specifies the destination IP address ■ `<Dest Port>` Specifies the destination Port Number (see *IANA Service Name and Port Number Registry*) ■ `<Protocol Number>` Specifies the Protocol Number (see *IANA Protocol Numbers*)

Table: Parameters of the 'fw ctl debug' command (continued)

Parameter	Description

	Notes:
	■ You cannot use the "`-F`" parameter together with these parameters: "`-H`", "`-e`", "`-i`".
	■ The "`-F`" parameter uses the Kernel Debug Filters. For more information, see *"Kernel Debug Filters" on page 328*.
	• For the Source IP address:
	`simple_debug_filter_saddr_<N> "<IP Address>"`
	• For the Source Ports:
	`simple_debug_filter_sport_<N> <1-65535>`
	• For the Destination IP address:
	`simple_debug_filter_daddr_<N> "<IP Address>"`
	• For the Destination Ports:
	`simple_debug_filter_dport_<N> <1-65535>`
	• For the Protocol Number:
	`simple_debug_filter_proto_<N> <0-254>`
	■ Value 0 means "`any`".
	■ This parameter supports up to 5 capture filters (up to 5 instances of the "`-F`" parameter in the syntax). The kernel debug performs the logical "OR" between all specified simple capture filters.
	■ If you are running multiple "`fw ctl debug`" commands at the same time, then you must specify all debug filters only in one command. Using the "`-F`" parameter in multiple "`fw ctl debug`" commands will result in the last specified filter overriding the "`-F`" filters in all previous "`fw ctl debug`" commands.

Table: Parameters of the 'fw ctl debug' command (continued)

Parameter	Description
`-H "<IP Address>"`	Creates an IP address filter - the debug output will include only connections to or from the specified IP address. For more information, see *"Kernel Debug Filters" on page 328*. Example - Capture traffic only to and from the Host 1.1.1.1: `fw ctl debug -H "1.1.1.1"` **Notes:** ■ You cannot use the "`-H`" parameter together with these parameters: "`-F`", "`-e`", "`-i`". ■ This parameter supports up to 3 capture filters (up to 3 instances of the "`-H`" parameter in the syntax). ■ If you are running multiple "`fw ctl debug`" commands at the same time, then you must specify all debug filters only in one command. Using the "`-H`" parameter in multiple "`fw ctl debug`" commands will result in the last specified filter overriding the "`-H`" filters in all previous "`fw ctl debug`" commands.
`-m <Name of Debug Module>`	Specifies the name of the kernel debug module, for which you print or configure the debug flags. To see a list of all debug modules, run: `fw ctl debug -m` See *"Kernel Debug Modules and Debug Flags" on page 351*.

Table: Parameters of the 'fw ctl debug' command (continued)

Parameter	Description

`{all | [+|-] <List of Debug Flags>}`	Specifies which debug flags to enable or disable in the specified kernel debug module.
	To see a list of all debug modules and their flags, run: `fw ctl debug -m`
	See *"Kernel Debug Modules and Debug Flags" on page 351*.
	■ `all`
	Enables all debug flags in the specified kernel debug module.
	■ `+ <List of Debug Flags>`
	Enables only the specified debug flags in the specified kernel module in addition to already enabled debug flags.
	You must press the space key after the plus (+) character:
	`+ <Flag1> [<Flag2> ... <FlagN>]`
	Example: "`+ drop conn`"
	■ `<List of Debug Flags>`
	Enables only the specified debug flags in the specified kernel module and disables all other enabled debug flags:
	`<Flag1> [<Flag2> ... <FlagN>]`
	Example: "`drop conn`"
	■ `- <List of Debug Flags>`
	Disables only the specified debug flags in the specified kernel debug module.
	You must press the space key after the minus (-) character:
	`- <Flag1> [<Flag2> ... <FlagN>]`
	Example: "`- conn`"

Table: Parameters of the 'fw ctl debug' command (continued)

Parameter	Description

`-e "<Expression>"`
`-i <Path to Filter File>`
`-i -`
`-u`
	Specifies the INSPECT filter for the debug:
	■ `-e "<Expression>"`
	Specifies the INSPECT filter.
	See the *R82 CLI Reference Guide* > Chapter "**Security Gateway Commands**" > Section "**fw**" > Section "**fw monitor**".
	■ `-i <Path to Filter File>`
	Specifies the file that contains the INSPECT filter.
	■ `-i -`
	Specifies that the INSPECT filter arrives from the standard input.
	The Security Gateway / Cluster Member / Security Group prompts to enter the INSPECT filter on the screen.
	■ `-u`
	Removes the INSPECT debug filter.
	Notes:
	■ These are *legacy* parameters ("`-e`" and "`-i`").
	■ When you use these parameters ("`-e`" and "`-i`"), the Security Gateway / Cluster Member / Security Group cannot apply the specified INSPECT filter to the accelerated traffic.
	■ For new debug filters, see *"Kernel Debug Filters" on page 328*.
	■ You cannot use the "`-e`" or "`-i`" parameter together with these parameters: "`-F`", "`-H`".

`-z`	The Security Gateway / Cluster Member / Security Group processes some connections in both SecureXL code and in the Host appliance code (for example, Passive Streaming Library (PSL) - an IPS infrastructure, which transparently listens to TCP traffic as network packets, and rebuilds the TCP stream out of these packets.). The Security Gateway / Cluster Member / Security Group processes some connections in only in the Host appliance code. When you use this parameter "`-z`", kernel debug output contains the debug messages only from the Host appliance code.
`-U`	Specifies to merge the debug information from the HyperFlow feature. This information is available only for the "`PSL`" debug module.

CLI Parameters for the 'fw ctl ndebug' command (for the new kernel debug)

Note - Only supported parameters are listed.

Table: Parameters of the 'fw ctl ndebug' command

Parameter	Description
`-v {"<List of VSIDs>" | all} -k`	In the VSNext mode: ■ Specifies the list of Virtual Gateways. ■ A VSNext Gateway automatically filters the collected kernel debug information for debug messages only for these Virtual Gateways. In the Traditional VSX mode: ■ Specifies the list of Virtual Systems. ■ A Traditional VSX Gateway automatically filters the collected kernel debug information for debug messages only for these Virtual Systems. Syntax: ■ `-v "<List of VSIDs>" -k` Monitors the debug messages only from the specified Virtual Gateways / Virtual Systems. To specify the Virtual Gateways / Virtual Systems, enter their VSID number separated with commas and without spaces: `"VSID1[,VSID2,VSID3,...,VSIDn]"` Example: `-v "1,3,7" -k` ■ `-v all -k` Monitors the debug messages from all configured Virtual Gateways / Virtual Systems. **Notes:** ■ To see the ID numbers of Virtual Gateways / Virtual Systems, run: `vsx stat {-v | -l}` This parameter "`-v`" is supported only in VSNext / Traditional VSX mode. ■ When you use this parameter "`-v`", you must also use the parameter "`-k`". When you use this "`-k`" parameter, the kernel debug output also contains the debug messages from kernel components that are not part of any Virtual Gateway / Virtual System, such as SecureXL and CoreXL dispatcher.
`-b <User Space Buffer Size>`	Specifies the size of the user space debug buffer. This buffer size should be at least the size of the maximum kernel debug buffer of 8200.

Table: Parameters of the 'fw ctl ndebug' command (continued)

Parameter	Description
`-p <List of Fields>`	By default, when the Security Gateway / Cluster Member / Security Group prints the debug messages, these messages start with the applicable CPU ID and CoreXL Firewall instance ID. You can print additional fields in the beginning of each debug message. **Notes:** ■ These fields are available: `all`, `proc`, `pid`, `date`, `mid`, `type`, `freq`, `topic`, `time`, `ticks`, `tid`, `text`, `errno`, `host`, `vsid`, `cpu`. ■ When you specify the applicable fields, separate them with commas and without spaces: `Field1,Field2,...,FieldN` ■ The more fields you specify, the higher the load on the CPU and on the hard disk.
`-T` `-t`	"`-T`" - Prints the time stamp in microseconds in front of each debug message. "`-t`" - Prints the time stamp in millseconds in front of each debug message. This time resolution is not enough to analyze the kernel debug properly. **Best Practice** - Always use the "`-T`" parameter to make the debug analysis easier.
`-M`	Disables the merge of all temporary debug files at the end of the kernel debug. This is helpful if you want to analyze an individual dedicated temporary debug file. **Important** - Use the "`-M`" parameter together with the "`-w`" parameter.
`-w`	Specifies not to delete the temporary debug files.
`-U`	Specifies to merge the debug information from the HyperFlow feature. See the *R82 Performance Tuning Administration Guide* > Chapter "**HyperFlow**".

Table: Parameters of the 'fw ctl ndebug' command (continued)

Parameter	Description
`-c <Number of CoreXL Firewall Instances in Debug Thread>`	Specifies the number of CoreXL Firewall Instances in each internal debug thread. The default is 4. **Best Practice** - Do not use this parameter, unless Check Point R&D or Support explicitly asked you to do so.
`-I {"<List of CoreXL Firewall Instances>" | all}`	Specifies the list of CoreXL Firewall Instances. ■ `-I "<List of CoreXL Firewall Instances>"` Monitors the debug messages only from the specified CoreXL Firewall Instances. To specify the CoreXL Firewall Instances, enter their ID number separated with commas and without spaces: `"ID1[,ID2,ID3,...,IDn]"` Example: `-I "1,3,7"` To see the ID numbers of CoreXL Firewall Instances, run: `fw ctl multik stat` ■ `-I all` Monitors the debug messages from all configured CoreXL Firewall Instances. This is the default.
`-o /<Path>/<Name of Output File>`	Specifies the path and the name of the debug output file. **Best Practice** - Always use the largest partition on the disk - `"/var/log/"`. The Security Gateway / Cluster Member / Security Group can generate many debug messages within short time. As a result, the debug output file can grow to large size very fast.

CLI Parameters for the 'fw ctl kdebug' command (for the legacy kernel debug)

Note - Only supported parameters are listed.

Table: Parameters of the 'fw ctl kdebug' command

Parameter	Description
`-v {"<List of VSIDs>" | all} -k`	In the VSNext mode: ■ Specifies the list of Virtual Gateways. ■ A VSNext Gateway automatically filters the collected kernel debug information for debug messages only for these Virtual Gateways. In the Traditional VSX mode: ■ Specifies the list of Virtual Systems. ■ A Traditional VSX Gateway automatically filters the collected kernel debug information for debug messages only for these Virtual Systems. Syntax: ■ `-v "<List of VSIDs>" -k` Monitors the debug messages only from the specified Virtual Gateways / Virtual Systems. To specify the Virtual Gateways / Virtual Systems, enter their VSID number separated with commas and without spaces: `"VSID1[,VSID2,VSID3,...,VSIDn]"` Example: `-v "1,3,7" -k` ■ `-v all -k` Monitors the debug messages from all configured Virtual Gateways / Virtual Systems. **Notes:** ■ To see the ID numbers of Virtual Gateways / Virtual Systems, run: `vsx stat {-v | -l}` ■ This parameter "`-v`" is supported only in VSNext / Traditional VSX mode. ■ When you use this parameter "`-v`", you must also use the parameter "`-k`". When you use this "`-k`" parameter, the kernel debug output also contains the debug messages from kernel components that are not part of any Virtual Gateway / Virtual System, such as SecureXL and CoreXL dispatcher.
`-b <User Space Buffer Size>`	Specifies the size of the user space debug buffer. This buffer size should be at least the size of the maximum kernel debug buffer of 8200.

Table: Parameters of the 'fw ctl kdebug' command (continued)

Parameter	Description
`-p <List of Fields>`	By default, when the Security Gateway / Cluster Member / Security Group prints the debug messages, these messages start with the applicable CPU ID and CoreXL Firewall instance ID. You can print additional fields in the beginning of each debug message. **Notes:** ■ To see the list of available fields, run: `fw ctl kdebug -h` ■ When you specify the applicable fields, separate them with commas and without spaces: `Field1,Field2,...,FieldN` ■ The more fields you specify, the higher the load on the CPU and on the hard disk.
`-T` `-t`	"`-T`" - Prints the time stamp in microseconds in front of each debug message. "`-t`" - Prints the time stamp in millseconds in front of each debug message. This time resolution is not enough to analyze the kernel debug properly. **Best Practice** - Always use the "`-T`" parameter to make the debug analysis easier.
`-f`	Collects the debug data until you stop the kernel debug in one of these ways: ■ When you press the **CTRL+C** keys. ■ When you run the "`fw ctl debug 0`" command. ■ When you run the "`fw ctl debug -x`" command. ■ When you kill the "`fw ctl kdebug`" process.
`-o /<Path>/<Name of Output File>`	Specifies the path and the name of the debug output file. **Best Practice** - Always use the largest partition on the disk - "`/var/log/`". The Security Gateway / Cluster Member / Security Group can generate many debug messages within short time. As a result, the debug output file can grow to large size very fast.

Table: Parameters of the 'fw ctl kdebug' command (continued)

Parameter	Description
`-o /<Path>/<Name of Output File> -m <Number of Cyclic Files> [-s <Size of Each Cyclic File in KB>]`	**Note** - The feature is supported only in the legacy kernel debug syntax "`fw ctl debug -o ...`". Saves the collected debug data into cyclic debug output files. When the size of the current "*<Name of Output File>*" reaches the specified "*<Size of Each Cyclic File in KB>*" (more or less), the Security Gateway / Cluster Member / Security Group renames the current "*<Name of Output File>*" to "*<Name of Output File>*`.0`" and creates a new "*<Name of Output File>*". If the "*<Name of Output File>*`.0`" already exists, the Security Gateway renames the "*<Name of Output File>*`.0`" to "*<Name of Output File>*`.1`", and so on - until the specified limit "*<Number of Cyclic Files>*". When the Security Gateway reaches the "*<Number of Cyclic Files>*", it deletes the oldest files. The valid values are: ■ *<Number of Cyclic Files>* - from 1 to 999 ■ *<Size of Each Cyclic File in KB>* - from 1 to 2097150

Kernel Debug Filters

Background

By default, kernel debug output contains information about all processed connections.

You can configure filters for kernel debug to collect debug messages only for the applicable connections.

There are three types of debug filters:

- By connection tuple parameters
- By an IP address parameter
- By a VPN peer parameter

To configure these kernel debug filters, assign the applicable values to the applicable kernel parameters **before** you start the kernel debug.

You assign the values to the applicable kernel parameters temporarily with the "`fw ctl set`" command.

Notes:

- Security Gateways / Cluster Members / Security Group Members support:
  - up to **five** Connection Tuple filters in total (from all types)
  - up to **three** Host IP Address filters
  - up to **two** VPN Peer filters
- Security Gateways / Cluster Members / Security Group Members apply these debug filters to both the non-accelerated and accelerated traffic.
- Security Gateways / Cluster Members / Security Group Members apply these debug filters to *"Kernel Debug Procedure with Connection Life Cycle" on page 343*.

Best Practice - It is usually simpler to set the Connection Tuple and Host IP Address filters from within the "`fw ctl debug`" command (see the *R82 CLI Reference Guide*). To filter the kernel debug by a VPN Peer, use the procedure below.

Debug Filter of the Type "By connection tuple parameters"

Security Gateways / Cluster Members / Security Group Members process connections based on the 5-tuple:

- Source IP address
- Source Port (see *IANA Service Name and Port Number Registry*)
- Destination IP address
- Destination Port (see *IANA Service Name and Port Number Registry*)
- Protocol Number (see *IANA Protocol Numbers*)

With this debug filter you can filter by these tuple parameters:

Tuple Parameter	Syntax for Kernel Parameters

Source IP address	■ On the Security Gateway / each Cluster Member, run in the Expert mode:
	`fw ctl set str simple_debug_filter_saddr_<N> "<IPv4 or IPv6 Address>"`
	■ On the Scalable Platform Security Group, run in the Expert mode:
	`g_fw ctl set str simple_debug_filter_saddr_<N> "<IPv4 or IPv6 Address>"`

Source Ports	■ On the Security Gateway / each Cluster Member, run in the Expert mode:
	`fw ctl set int simple_debug_filter_sport_<N> <1-65535>`
	■ On the Scalable Platform Security Group, run in the Expert mode:
	`g_fw ctl set int simple_debug_filter_sport_<N> <1-65535>`

Destination IP address	■ On the Security Gateway / each Cluster Member, run in the Expert mode:
	`fw ctl set str simple_debug_filter_daddr_<N> "<IPv4 or IPv6 Address>"`
	■ On the Scalable Platform Security Group, run in the Expert mode:
	`g_fw ctl set str simple_debug_filter_daddr_<N> "<IPv4 or IPv6 Address>"`

Destination Ports	■ On the Security Gateway / each Cluster Member, run in the Expert mode:
	`fw ctl set int simple_debug_filter_dport_<N> <1-65535>`
	■ On the Scalable Platform Security Group, run in the Expert mode:
	`g_fw ctl set int simple_debug_filter_dport_<N> <1-65535>`

Tuple Parameter	Syntax for Kernel Parameters

Protocol Number	■ On the Security Gateway / each Cluster Member, run in the Expert mode:
	`fw ctl set int simple_debug_filter_proto_<N> <0-254>`
	■ On the Scalable Platform Security Group, run in the Expert mode:
	`g_fw ctl set int simple_debug_filter_proto_<N> <0-254>`

Notes:

1. *<N>* is an integer between 1 and 5. This number is an index for the configured kernel parameters of this type.
2. When you specify IP addresses, you must enclose them in double quotes.
3. When you configure kernel parameters with the *same* index <N>, the debug filter is a logical "**AND**" of these kernel parameters.
   In this case, the final filter matches only *one* direction of the processed connection.
   - Example 1 - packets from the source IP address X to the destination IP address Y:

     ```
     simple_debug_filter_saddr_1 <Value X>
     AND
     simple_debug_filter_daddr_1 <Value Y>
     ```
   - Example 2 - packets from the source IP address X to the destination port Y:

     ```
     simple_debug_filter_saddr_1 <Value X>
     AND
     simple_debug_filter_dport_1 <Value Y>
     ```
4. When you configure kernel parameters with the *different* indices <N>, the debug filter is a logical "OR" of these kernel parameters.
   This means that if it is necessary the final filter matches both directions of the connection, then it is necessary to configure the applicable debug filters for both directions.
   - Example 1 - packets either from the source IP address X, or to the destination IP address Y:

     ```
     simple_debug_filter_saddr_1 <Value X>
     OR
     simple_debug_filter_daddr_2 <Value Y>
     ```
   - Example 2 - packets either from the source IP address X, or to the destination port Y:

     ```
     simple_debug_filter_saddr_1 <Value X>
     OR
     simple_debug_filter_dport_2 <Value Y>
     ```
5. For information about the Port Numbers, see *IANA Service Name and Port Number Registry*.
6. For information about the Protocol Numbers, see *IANA Protocol Numbers*.

Debug Filter of the Type "By an IP address parameter"

With this debug filter you can filter by one IP address, which is either the source or the destination IP address of the packet.

Syntax for Kernel Parameters:

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl set str simple_debug_filter_addr_<N> "<IPv4 or IPv6 Address>"
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl set str simple_debug_filter_addr_<N> "<IPv4 or IPv6 Address>"
```

Notes:

1. *<N>* is an integer between 1 and 3.
   This number is an index for the configured kernel parameters of this type.
2. You can configure one, two, or three of these kernel parameters at the same time.
   - Example 1:
     Configure one IP address (`simple_debug_filter_addr_1`).
   - Example 2:
     Configure two IP addresses (`simple_debug_filter_addr_1` and `simple_debug_filter_addr_2`).
     This would match packets, where any of these IP addresses appears, either as a source or a destination.
3. You must enclose the IP addresses in double quotes.

Debug Filter of the Type "By a VPN peer parameter"

With this debug filter you can filter by one IP address.

Syntax for Kernel Parameters:

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl set str simple_debug_filter_vpn_<N> "<IPv4 or IPv6 Address>"
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl set str simple_debug_filter_vpn_<N> "<IPv4 or IPv6 Address>"
```

Notes:

1. *<N>* is an integer - 1 or 2.
   This number is an index for the configured kernel parameters of this type.
2. You can configure one or two of these kernel parameters at the same time.
   - Example 1:
     Configure one VPN peer (`simple_debug_filter_vpn_1`).
   - Example 2:
     Configure two VPN peers (`simple_debug_filter_vpn_1` and `simple_debug_filter_vpn_2`).
3. You must enclose the IP addresses in double quotes.

Disabling of All Debug Filters

You can disable all the configured debug filters of all types.

Syntax for Kernel Parameter:

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl set int simple_debug_filter_off 1
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl set int simple_debug_filter_off 1
```

Usage Example

It is necessary to show in the kernel debug the information about the connection from Source IP address 192.168.20.30 from any Source Port to Destination IP address 172.16.40.50 to Destination Port 80 (192.168.20.30:<Any> --> 172.16.40.50:80).

Run these commands **before** you start the kernel debug:

```
fw ctl set int simple_debug_filter_off 1
fw ctl set str simple_debug_filter_saddr_1 "192.168.20.30"
fw ctl set str simple_debug_filter_daddr_1 "172.16.40.50"
fw ctl set str simple_debug_filter_saddr_2 "172.16.40.50"
fw ctl set str simple_debug_filter_daddr_2 "192.168.20.30"
fw ctl set int simple_debug_filter_dport_1 80
fw ctl set int simple_debug_filter_sport_2 80
```

Important - In the above example, two Connection Tuple filters are used ("`..._1`" and "`..._2`") - one for each direction, because we want the debug filter to match both directions of this connection.

Kernel Debug Procedure

Alternatively, use the *"Kernel Debug Procedure with Connection Life Cycle" on page 343*.

Important:

- Schedule a maintenance window.
  Debug increases the load on the CPU on the Security Gateway / Cluster Members / Security Group Members.
- We strongly recommend to connect over serial console to your Security Gateway / each Cluster Member / Scalable Platform Security Group Members.
  This is to prevent a possible issue when you cannot work with the CLI because of a high load on the CPU.
- In Cluster, you must perform these steps on all the Cluster Members in the same way.
- On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.
- The procedure below contains steps for SecureXL debug as well.
  Follow these steps only if the traffic issue is caused by SecureXL.
- See *"Kernel Debug Syntax" on page 304*.

Step	Instructions
1	Connect to the command line on the Security Gateway / each Cluster Member over SSH, or console. **Note** - On Scalable Platforms (ElasticXL, Maestro, and Chassis), you must connect to the Gaia Portal of the applicable Security Group.
2	Log in to the Expert mode.

3	Reset the kernel debug flags in all kernel debug modules.
	■ On the Security Gateway / each Cluster Member, run:
	`fw ctl debug 0`
	■ On the Scalable Platform Security Group, run:
	`g_fw ctl debug 0`

4	Reset the kernel debug flags in all SecureXL debug modules.
	■ On the Security Gateway / each Cluster Member, run:
	`fwaccel dbg resetall`
	■ On the Scalable Platform Security Group, run:
	`g_fwaccel dbg resetall`

Step	Instructions

5	Reset the kernel debug filters.
	■ On the Security Gateway / each Cluster Member, run:
	`fw ctl set int simple_debug_filter_off 1`
	■ On the Scalable Platform Security Group, run:
	`g_fw ctl set int simple_debug_filter_off 1`

6	Configure the applicable kernel debug filters. See *"Kernel Debug Filters" on page 328*.

7	Allocate the kernel debug buffer for each CoreXL Firewall instance.
	■ On the Security Gateway / each Cluster Member, run:
	`fw ctl debug -buf 8200`
	■ On the Security Gateway / each Cluster Member in the VSNext / Traditional VSX mode, run:
	`fw ctl debug -buf 8200 -v {"<List of VSIDs>" | all} -k`
	■ On the Scalable Platform Security Group, run:
	`g_fw ctl debug -buf 8200`
	■ On the Scalable Platform Security Group in the VSNext / Traditional VSX mode, run:
	`g_fw ctl debug -buf 8200 -v {"<List of VSIDs>" | all} -k`

8	Make sure the Security Gateway allocated the kernel debug buffer.
	■ On the Security Gateway / each Cluster Member, run:
	`fw ctl debug | grep buffer`
	■ On the Scalable Platform Security Group, run:
	`g_fw ctl debug | grep buffer`

Step	Instructions

9	Configure the applicable kernel debug modules and kernel debug flags.
	■ On the Security Gateway / each Cluster Member, run:
	`fw ctl debug -m <Name of Kernel Debug Module> {all | + <Kernel Debug Flags>}`
	■ On the Security Gateway / each Cluster Member in the VSNext / Traditional VSX mode, run:
	`fw ctl debug -v {"<List of VSIDs>" | all} -k -m <Name of Kernel Debug Module> {all | + <Kernel Debug Flags>}`
	■ On the Scalable Platform Security Group, run:
	`g_fw ctl debug -m <Name of Kernel Debug Module> {all | + <Kernel Debug Flags>}`
	■ On the Scalable Platform Security Group in the VSNext / Traditional VSX mode, run:
	`g_fw ctl debug -v {"<List of VSIDs>" | all} -k -m <Name of Kernel Debug Module> {all | + <Kernel Debug Flags>}`
	See *"Kernel Debug Modules and Debug Flags" on page 351*.
	Important - The CPU load increases at this point because the Firewall kernel starts to write **some** debug messages to the `/var/log/messages` file and the `dmesg` buffer.

10	Configure the applicable SecureXL debug modules and SecureXL debug flags.
	■ On the Security Gateway / each Cluster Member, run:
	`fwaccel dbg -m <Name of SecureXL Debug Module> {all | + <SecureXL Debug Flags>}`
	■ On the Scalable Platform Security Group, run:
	`g_fwaccel dbg -m <Name of SecureXL Debug Module> {all | + <SecureXL Debug Flags>}`
	See the *R82 Performance Tuning Administration Guide* > **SecureXL** > **SecureXL Commands and Debug** > **SecureXL Debug** > **SecureXL Debug Procedure**.
	Important - The CPU load increases at this point because the SecureXL starts to write **some** debug messages to the `/var/log/messages` file and the `dmesg` buffer.

Step	Instructions

11	Examine the the kernel debug configuration for kernel debug modules.
	■ On the Security Gateway / each Cluster Member, run:
	`fw ctl debug -m <module>`
	■ On the Scalable Platform Security Group, run:
	`g_fw ctl debug -m <module>`

12	Examine the SecureXL debug configuration for SecureXL debug modules
	■ On the Security Gateway / each Cluster Member, run:
	`fwaccel dbg list`
	■ On the Scalable Platform Security Group, run:
	`g_fwaccel dbg list`

Step	Instructions

13	Save the kernel debug output to a file.
	Note - For information about the new kernel debug mode (R82 and higher), see *"Kernel Debug Behavior on Security Gateways with 72 and more CPU Cores" on page 305*.
	Important - The CPU load increases even more at this point because the Firewall starts to write **all** debug messages to the output file.
	■ On the Security Gateway / each Cluster Member, run:
	• For the new kernel debug mode:
	`fw ctl ndebug -T -o /var/log/kernel_debug.txt`
	• For the legacy kernel debug mode:
	`fw ctl kdebug -T -f -o /var/log/kernel_debug.txt`
	■ On the Security Gateway / each Cluster Member in the VSNext / Traditional VSX mode, run:
	• For the new kernel debug mode:
	`fw ctl ndebug -v {"<List of VSIDs>" | all} -k -T -o /var/log/kernel_debug.txt`
	• For the legacy kernel debug mode:
	`fw ctl kdebug -v {"<List of VSIDs>" | all} -k -T -f -o /var/log/kernel_debug.txt`
	■ On the Scalable Platform Security Group, run:
	• For the new kernel debug mode:
	`g_fw ctl ndebug -T -o /var/log/kernel_debug.txt`
	• For the legacy kernel debug mode:
	`g_fw ctl kdebug -T -f -o /var/log/kernel_debug.txt`
	■ On the Scalable Platform Security Group in the VSNext / Traditional VSX mode, run:
	• For the new kernel debug mode:
	`g_fw ctl ndebug -v {"<List of VSIDs>" | all} -k -T -o /var/log/kernel_debug.txt`
	• For the legacy kernel debug mode:
	`g_fw ctl kdebug -v {"<List of VSIDs>" | all} -k -T -f -o /var/log/kernel_debug.txt`

14	Replicate the issue, or wait for the issue to occur.

Step	Instructions
15	Stop the kernel debug output: Press the **CTRL+C** keys. **Important** - This does not stop all CPU load yet because the Firewall kernel continues to write **some** debug messages to the `/var/log/messages` file and the `dmesg` buffer.

16	Reset all kernel debug flags in all kernel debug modules.
	■ On the Security Gateway / each Cluster Member, run:
	`fw ctl debug 0`
	■ On the Scalable Platform Security Group, run:
	`g_fw ctl debug 0`
	Important - This stops all CPU load from the kernel debug.

17	Reset all the SecureXL debug flags in all SecureXL debug modules.
	■ On the Security Gateway / each Cluster Member, run:
	`fwaccel dbg resetall`
	■ On the Scalable Platform Security Group, run:
	`g_fwaccel dbg resetall`
	Important - This stops all CPU load from the SecureXL debug.

18	Reset the kernel debug filters.
	■ On the Security Gateway / each Cluster Member, run:
	`fw ctl set int simple_debug_filter_off 1`
	■ On the Scalable Platform Security Group, run:
	`g_fw ctl set int simple_debug_filter_off 1`

19	Examine the kernel debug configuration to make sure it returned to the default.
	■ On the Security Gateway / each Cluster Member, run:
	`fw ctl debug`
	■ On the Scalable Platform Security Group, run:
	`g_fw ctl debug`

Step	Instructions

20	Examine the SecureXL debug configuration to make sure it returned to the default.
	■ On the Security Gateway / each Cluster Member, run:
	`fwaccel dbg list`
	■ On the Scalable Platform Security Group, run:
	`g_fwaccel dbg list`

21	Transfer these files from the Security Gateway / each Cluster Member / each Security Group Member to your computer:
	`/var/log/kernel_debug.txt`
	`/var/log/messages*`
	`$FWDIR/log/fwk.elg*`
	`/var/log/usim_x86.elg*`
	Best Practice - Compress this file with the "`tar -zxvf`" command and transfer it from the Security Gateway / each Cluster Member / each Security Group Members to your computer. If you transfer to an FTP server, do so in the binary mode.

22	Analyze the debug output file.

Example - Connection 192.168.20.30:<Any> --> 172.16.40.50:80

```
[Expert@GW:0]# fw ctl debug 0
Defaulting all kernel debugging options
Debug state was reset to default.
[Expert@GW:0]#
[Expert@GW:0]# fw ctl set int simple_debug_filter_off 1
[Expert@GW:0]#
[Expert@GW:0]# fw ctl set str simple_debug_filter_saddr_1 "192.168.20.30"
[Expert@GW:0]#
[Expert@GW:0]# fw ctl set str simple_debug_filter_daddr_2 "192.168.20.40"
[Expert@GW:0]#
[Expert@GW:0]# fw ctl set int simple_debug_filter_dport_1 80
[Expert@GW:0]#
[Expert@GW:0]# fw ctl debug -buf 8200
Initialized kernel debugging buffer to size 8192K
[Expert@GW:0]#
[Expert@GW:0]# fw ctl debug | grep buffer
Kernel debugging buffer size: 8192KB
[Expert@GW:0]#
[Expert@GW:0]# fw ctl debug -m fw + conn drop
Updated kernel's debug variable for module fw
Debug flags updated.
[Expert@GW:0]#
[Expert@GW:0]# fw ctl debug -m fw
Kernel debugging buffer size: 8192KB
Module: fw
Enabled Kernel debugging options: error warning conn drop
Messaging threshold set to type=Info freq=Common
[Expert@GW:0]#
[Expert@GW:0]# fw ctl kdebug -T -f -o /var/log/kernel_debug.txt
... ... Replicate the issue, or wait for the issue to occur ... ...
... ... Press CTRL+C ... ...
[Expert@GW:0]#
[Expert@GW:0]# fw ctl debug 0
Defaulting all kernel debugging options
Debug state was reset to default.
[Expert@GW:0]#
[Expert@GW:0]# fw ctl set int simple_debug_filter_off 1
[Expert@GW:0]#
[Expert@GW:0]# ls -l /var/log/kernel_debug.txt
-rw-rw---- 1 admin root 1630619 Apr 12 19:49 /var/log/kernel_debug.txt
[Expert@GW:0]#
```

Kernel Debug Procedure with Connection Life Cycle

Introduction

Connection Life Cycle is a debug tool.

This tool generates a formatted debug output file (in the Ruby format) that presents the debug messages hierarchically by connections and packets:

- The first hierarchy level shows connections.
- After you expand the connection, you see all the packets of this connection.

Important - You must use this tool in the Expert mode together with the regular kernel debug flags (see *"Kernel Debug Modules and Debug Flags" on page 351*).

Syntax for a Security Gateway / each Cluster Member

- To start the debug capture:

```
conn_life_cycle.sh -a start -o /<Path>/<Name of Raw Debug
Output File> [{-t | -T}] [[-f "<Filter1>"] [-f "<Filter2>"] [-
f "<Filter3>] [-f "<Filter4>] [-f "<Filter5>"]]
```

- To stop the debug capture and prepare the formatted debug output:

```
conn_life_cycle.sh -a stop -o /<Path>/<Name of Formatted Debug
Output File>
```

Syntax for a Scalable Platform Security Group

- To start the debug capture:

```
g_all conn_life_cycle.sh -a start -o /<Path>/<Name of Raw
Debug Output File> [{-t | -T}] [[-f "<Filter1>"] [-f
"<Filter2>"] [-f "<Filter3>] [-f "<Filter4>] [-f "<Filter5>"]]
```

- To stop the debug capture and prepare the formatted debug output:

```
g_all conn_life_cycle.sh -a stop -o /<Path>/<Name of Formatted
Debug Output File>
```

Parameters

Table: Parameters of the 'conn_life_cycle.sh' script

Parameter	Description
`-a start` `-a stop`	Mandatory. Specifies the action: ■ `start` - Starts the debug capture based on the debug flags you enabled and debug filters you specified. ■ `stop` - Stops the debug capture, resets the kernel debug options, resets the kernel debug filters.
`-t | -T`	Optional. Specifies the resolution of a time stamp in front of each debug message: ■ `-t` - Prints the time stamp in milliseconds. ■ `-T` - Prints the time stamp in microseconds. **Best Practice** - Always use the "`-T`" option to make the debug analysis easier.

`-f "<Filter>"`	Optional.
	Specifies which connections and packets to capture.
	For additional information, see *"Kernel Debug Filters" on page 328*.
	Important - If you do not specify filters, then the tool prints debug messages for *all* traffic. This causes high load on the CPU and increases the time to format the debug output file.
	Each filter must contain these five numbers (5-tuple) separated with commas:
	`"<Source IP Address>,<Source Port>,<Destination IP Address>,<Destination Port>,<Protocol Number>"`
	Example of capturing traffic from IP 192.168.20.30 from any port to IP 172.16.40.50 to port 22 over the TCP protocol:
	`-f "192.168.20.30,0,172.16.40.50,22,6"`

Table: Parameters of the 'conn_life_cycle.sh' script (continued)

Parameter	Description
	Notes: ■ The tool supports up to **five** of such filters. ■ The tool treats the value 0 (zero) as "any". ■ If you specify two or more filters, the tool performs a logical "OR" of all the filters on each packet. If the packet matches at least one filter, the tool prints the debug messages for this packet. ■ "*<Source IP Address>*" and "*<Destination IP Address>*" - IPv4 or IPv6 address ■ "*<Source Port>*" and "*<Destination Port>*" - integers from 1 to 65535 (see *IANA Service Name and Port Number Registry*) ■ *<Protocol Number>* - integer from 0 to 254 (see *IANA Protocol Numbers*)
`-o /<Path>/<Name of Raw Debug Output File>`	Mandatory. Specifies the absolute path and the name of the raw debug output file. Example: `-o /var/log/kernel_debug.txt`
`-o /<Path>/<Name of Formatted Debug Output File>`	Mandatory. Specifies the absolute path and the name of the formatted debug output file (to analyze by an administrator). Example: `-o /var/log/kernel_debug_formatted.txt`

Procedure

Important - In cluster, you must perform these steps on all the Cluster Members in the same way.

1. **Connect to the command line on your Security Gateway / each Cluster Member / Scalable Platform Security Group**

   Use an SSH or a console connection.

   Best Practice - Use a console connection.

   Notes for Scalable Platforms:
   - If you connect over SSH, you must connect to the applicable Security Group.
   - If you connect over a serial console, you must connect to the Security Group Member that runs as the SMO (Single Management Object).

2. **Log in to the Expert mode**

   If the default shell is Gaia Clish, run:

   ```
   expert
   ```

3. **Enable the applicable debug flags in the applicable kernel modules**

   - On the Security Gateway / each Cluster Member, run:

     ```
     fw ctl debug -m <module> {all | + <flags>}
     ```

   - On the Scalable Platform Security Group, run:

     ```
     g_fw ctl debug -m <module> {all | + <flags>}
     ```

4. **Examine the list of the debug flags that are enabled in the specified kernel modules**

   - On the Security Gateway / each Cluster Member, run:

     ```
     fw ctl debug -m <module>
     ```

   - On the Scalable Platform Security Group, run:

     ```
     g_fw ctl debug -m <module>
     ```

5. **Start the debug capture**

- On the Security Gateway / each Cluster Member, run:

```
conn_life_cycle.sh -a start -o /var/log/kernel_debug.txt
-T -f "<Filter1>" [... [-f "<FilterN>"]]
```

- On the Scalable Platform Security Group, run:

```
g_all conn_life_cycle.sh -a start -o /var/log/kernel_
debug.txt -T -f "<Filter1>" [... [-f "<FilterN>"]]
```

6. **Replicate the issue, or wait for the issue to occur**

   Replicate the issue if you know how, or wait for the issue to occur.

7. **Stop the debug capture and prepare the formatted debug output**

   - On the Security Gateway / each Cluster Member, run:

```
conn_life_cycle.sh -a stop -o /var/log/kernel_debug_
formatted.txt
```

   - On the Scalable Platform Security Group, run:

```
g_all conn_life_cycle.sh -a stop -o /var/log/kernel_
debug_formatted.txt
```

8. **Transfer the output file to your computer**

   Transfer this file from the Security Gateway / each Cluster Member / each Security Group Member to your computer:

```
/var/log/kernel_debug.txt
```

   Best Practice - Compress this file with the "`tar -zxvf`" command and transfer it from the Security Gateway / each Cluster Member / each Security Group Members to your computer. If you transfer to an FTP server, do so in the binary mode.

9. **Analyze the output file on your computer**

   Examine the formatted debug output file in an advanced text editor like Notepad++ (click **Language > R > Ruby**), or any other Ruby language viewer.

Example

Collecting the kernel debug for TCP connection from IP 172.20.168.15 (any port) to IP 192.168.3.53 and port 22

```
[Expert@GW:0]# fw ctl debug -m fw + conn drop
Updated kernel's debug variable for module fw
Debug flags updated.
[Expert@GW:0]#
[Expert@GW:0]# fw ctl debug -m fw
Kernel debugging buffer size: 50KB
HOST:
Module: fw
Enabled Kernel debugging options: error warning conn drop
Messaging threshold set to type=Info freq=Common
[Expert@GW:0]#
[Expert@GW:0]# conn_life_cycle.sh -a start -o /var/log/kernel_debug.txt -T -f
"172.20.168.15,0,192.168.3.53,22,6"
Set operation succeeded
Set operation succeeded
Set operation succeeded
Set operation succeeded
Set operation succeeded
Set operation succeeded
Set operation succeeded
Initialized kernel debugging buffer to size 8192K
Set operation succeeded
Capturing started...
[Expert@GW:0]#

... ... Replicate the issue, or wait for the issue to occur ... ...

[Expert@GW:0]#
[Expert@GW:0]# conn_life_cycle.sh -a stop -o /var/log/kernel_debug_formatted.txt
Set operation succeeded
Defaulting all kernel debugging options
Debug state was reset to default.
Set operation succeeded
doing unification...
Openning host debug file /tmp/tmp.KiWmF18217... OK
New unified debug file: /tmp/tmp.imzMZ18220... OK
prepare unification
performing unification
Done :-)
doing grouping...
wrapping connections and packets...
Some of packets lack description, probably because they were already handled when the feature
was enabled.
[Expert@GW:0]#
[Expert@GW:0]# fw ctl debug -m fw
Kernel debugging buffer size: 50KB
HOST:
Module: fw
Enabled Kernel debugging options: error warning
Messaging threshold set to type=Info freq=Common
[Expert@GW:0]
[Expert@GW:0] ls -l /var/log/kernel_debug.*
-rw-rw---- 1 admin root 40960 Nov 26 13:02 /var/log/kernel_debug.txt
-rw-rw---- 1 admin root 24406 Nov 26 13:02 /var/log/kernel_debug_formatted.txt
[Expert@GW:0]
```

Opening the kernel debug in Notepad++

Everything is collapsed:

```
   Connection with 1st packet already in handling so no conn details
[+]
{++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
++++++++++++++++++++++++++++++++++
```

Opened the first hierarchy level to see the connection:

```
   Connection with 1st packet already in handling so no conn details
[-]
{++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
++++++++++++++++++++++++++++++++++
;26Nov2018 13:02:06.736016;[cpu_2];[fw4_1];Packet 0xffff8101ea45e680 is  INBOUND;
[+]{------------------------------------------------------------ packet begins ----------------
--------------------------------------
```

Opened the second hierarchy level to see the packets of this connection:

```
   Connection with 1st packet already in handling so no conn details
[-]
{++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
++++++++++++++++++++++++++++++++

```

Kernel Debug Modules and Debug Flags

This section describes the Kernel Debug Modules and their Debug Flags.

To see the available kernel debug modules and their debug flags:

- On the Security Gateway / each Cluster Member, run in Gaia Clish or the Expert mode:

  ```
  fw ctl debug -m
  ```

- On the Scalable Platform Security Group, run in Gaia gClish:

  ```
  fw ctl debug -m
  ```

- On the Scalable Platform Security Group, run in the Expert mode:

  ```
  g_fw ctl debug -m
  ```

List of kernel debug modules (in alphabetical order):

Module "accel_apps" (Accelerated Applications)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m accel_apps + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m accel_apps + {all | <List of Debug Flags>}
```

Flag	Description
`av_lite`	Content Inspection (Anti-Virus) Lite application - general information about packet processing
`cmi_lite`	Context Management Interface / Infrastructure Lite application - general information about packet processing
`daf_lite`	Mirror and Decrypt Lite application - general information about packet processing
`daf_lite_dump`	Mirror and Decrypt Lite application - writes the contents of the internal buffer
`error`	General errors
`info`	General information
`rad_lite`	Resource Advisor Lite application - general information about internal connection processing
`warning`	General warnings

Module "accel_pm_mgr" (Accelerated Pattern Match Manager)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m accel_pm_mgr + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m accel_pm_mgr + {all | <List of Debug Flags>}
```

Flag	Description
`debug`	Operations in the Accelerated Pattern Match Manager module
`error`	General errors and failures
`flow`	Internal flow of functions
`submit_error`	General failures to submit the data for analysis
`warning`	General warnings and failures

Module "APPI" (Application Control Inspection)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m APPI + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m APPI + {all | <List of Debug Flags>}
```

Flag	Description
`account`	Accounting information
`address`	Information about connection's IP address
`btime`	Browse time
`connection`	Application Control connections
`coverage`	Coverage times (entering, blocking, and time spent)
`error`	General errors
`global`	Global policy operations
`info`	General information
`limit`	Application Control limits
`memory`	Memory allocation operations
`module`	Operations in the Application Control module (initialization, module loading, calls to the module, policy loading, and so on)
`observer`	Classification Object (CLOB) observer (data classification)
`policy`	Application Control policy
`referrer`	Application Control referrer
`subject`	Prints the debug subject of each debug message
`timestamp`	Prints the timestamp for each debug message (changes when you enable the debug flag '`coverage`')

Flag	Description
`urlf_ssl`	Application Control and URL Filtering for SSL
`verbose`	Prints additional information (used with other debug flags)
`vs`	Prints the VSID of the debugged Virtual System
`warning`	General warnings

Module "BOA" (Boolean Analyzer for Web Intelligence)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m BOA + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m BOA + {all | <List of Debug Flags>}
```

Flag	Description
`analyzer`	Operations in the BOA module
`disasm`	Disassembler information
`error`	General errors
`fatal`	Fatal errors
`flow`	Operations in the BOA module
`info`	General information
`lock`	Information about internal locks in the FireWall kernel
`memory`	Memory allocation operations
`spider`	Internal hash tables
`stat`	Statistics
`stream`	Memory allocation when processing streamed data
`warning`	General warnings

Module "CI" (Content Inspection)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m CI + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m CI + {all | <List of Debug Flags>}
```

Flag	Description
`address`	Prints connection addresses (as `Source_IP:Source_Port -> Dest_IP:Dest_Port`)
`av`	Anti-Virus inspection
`coverage`	Coverage times (entering, blocking, and time spent)
`crypto`	Basic information about encryption and decryption
`error`	General errors
`fatal`	Fatal errors
`filter`	Basic information about URL filters
`info`	General information
`ioctl`	*Currently is not used*
`memory`	Memory allocation operations
`module`	Operations in the Content Inspection module (initialization, module loading, calls to the module, policy loading, and so on)
`policy`	Content Inspection policy
`profile`	Basic information about the Content Inspection module (initialization, destroying, freeing)
`regexp`	Regular Expression library
`session`	Session layer
`stat`	Content Inspection statistics

Flag	Description
`subject`	Prints the debug subject of each debug message
`timestamp`	Prints the timestamp for each debug message (changes when you enable the debug flag '`coverage`')
`track`	Use only for very limited important debug prints, so it can be used in a loaded environment - Content-Disposition, Content-Type, extension validation, extension matching
`uf`	URL filters and URL cache
`vs`	Prints the VSID of the debugged Virtual System
`warning`	General warnings

Module "cluster" (ClusterXL)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m cluster + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m cluster + {all | <List of Debug Flags>}
```

Notes:

- To print all synchronization operations in Check Point cluster in the debug output, enable these debug flags:
  - The debug flag "`sync`" in *"Module "fw" (Firewall)" on page 383*
  - The debug flag "`sync`" in *"Module "CPAS" (Check Point Active Streaming)" on page 366*
- To print the contents of the packets in HEX format in the debug output (as "`FW-1: fwha_print_packet: Buffer ...`"), before you start the kernel debug, set this kernel parameter on each Cluster Member / the applicable Scalable Platform Security Group:
  - On the Security Gateway / each Cluster Member, run in the Expert mode:

    ```
    fw ctl set int fwha_dprint_io 1
    ```

  - On the Scalable Platform Security Group, run in the Expert mode:

    ```
    g_fw ctl set int fwha_dprint_io 1
    ```

- To print all network checks in the debug output, before you start the kernel debug, set this kernel parameter on each Cluster Member:
  - On the Security Gateway / each Cluster Member, run in the Expert mode:

    ```
    fw ctl set int fwha_dprint_all_net_check 1
    ```

  - On the Scalable Platform Security Group, run in the Expert mode:

    ```
    g_fw ctl set int fwha_dprint_all_net_check 1
    ```

Flag	Description
`arp`	ARP Forwarding (see sk111956)
`autoccp`	Operations of CCP in Auto mode
`balance`	Operation of ClusterXL in Load Sharing Unicast mode (Pivot mode)
`ccp`	Reception and transmission of Cluster Control Protocol (CCP) packets

Flag	Description
`cloud`	Replies to the probe packets in CloudGuard IaaS
`conf`	Cluster configuration and policy installation
`correction`	Correction Layer
`cu`	Connectivity Upgrade (see sk107042)
`drop`	Connections dropped by the cluster Decision Function (DF) module (does not include CCP packets)
`forward`	Forwarding Layer messages (when Cluster Members send and receive a forwarded packet)
`if`	Interface tracking and validation (all the operations and checks on interfaces)
`ifstate`	Interface state (all the operations and checks on interfaces)
`io`	Information about sending of packets through cluster interfaces
`log`	Creating and sending of logs by cluster **Note** - In addition, enable the debug flag "`log`" in *"Module "fw" (Firewall)" on page 383*.
`mac`	Current configuration of and detection of cluster interfaces **Note** - In addition, enable the debug flags "`conf`" and "`if`" in this debug module
`mmagic`	Operations on "MAC magic" (getting, setting, updating, initializing, dropping, and so on)
`msg`	Handling of internal messages between Cluster Members
`multik`	Processing of connections in CoreXL Firewall instances **Notes:** ■ In addition, see *"Module "multik" (Multi-Kernel Inspection - CoreXL)" on page 402*. ■ If you use the QoS Software Blade, enable the debug flag "`multik`" in the *"Module "fg" (FloodGate-1 - QoS)" on page 379*.
`osp`	Only for Scalable Platforms: Distribution of connections between Security Group Members

Flag	Description
`pnote`	Registration and monitoring of Critical Devices (pnotes)
`select`	Packet selection (includes the Decision Function)
`smo`	Only for Scalable Platforms: Processing of connections on the SMO Security Group Member
`stat`	States of cluster members (state machine)
`subs`	Subscriber module (set of APIs, which enable user space processes to be aware of the current state of the ClusterXL state machine and other clustering configuration parameters)
`timer`	Reports of cluster internal timers
`trap`	Sending trap messages from the cluster kernel to the RouteD daemon about Master change
`unisync`	Only for Scalable Platforms: Unicast Sync - synchronization of connections to backup Security Group Members on the local Maestro Site / Scalable Chassis and to one Security Group Member one the standby Maestro Site / Scalable Chassis
`vpn`	Processing of VPN connections

Module "cmi_loader" (Context Management Interface / Infrastructure Loader)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m cmi_loader + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m cmi_loader + {all | <List of Debug Flags>}
```

Flag	Description
`address`	Information about connection's IP address
`connection`	Internal messages about connection
`coverage`	Coverage times (entering, blocking, and time spent)
`cpcode`	DLP CPcode **Note** - In addition, see *"Module "cpcode" (Data Loss Prevention - CPcode)" on page 368*.
`error`	General errors
`global_ states`	User Space global state structures
`info`	General information
`inspect`	INSPECT code
`memory`	Memory allocation operations
`module`	Operations in the Context Management Interface / Infrastructure Loader module (initialization, module loading, calls to the module, contexts, and so on)
`parsers_is`	Module parsers infrastructure
`policy`	Policy installation
`sigload`	Signatures, patterns, ranges
`subject`	Prints the debug subject of each debug message

Flag	Description
`timestamp`	Prints the timestamp for each debug message (changes when you enable the debug flag '`coverage`')
`verbose`	Prints additional information (used with other debug flags)
`vs`	Prints the VSID of the debugged Virtual System
`warning`	General warnings

Module "CPAS" (Check Point Active Streaming)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m CPAS + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m CPAS + {all | <List of Debug Flags>}
```

Flag	Description
`api`	Interface layer messages
`conns`	Detailed description of connections, and connection's limit-related messages
`cpconntim`	Information about internal timers
`error`	General errors
`events`	Event-related messages
`ftp`	Messages of the FTP example server
`glue`	Glue layer messages
`http`	Messages of the HTTP example server
`icmp`	Messages of the ICMP example server
`notify`	E-mail Messaging Security application
`pkts`	Packets handling messages (allocation, splitting, resizing, and so on)
`skinny`	Processing of Skinny Client Control Protocol (SCCP) connections
`sync`	Synchronization operations in cluster **Note** - In addition, see the debug flag "`sync`" in *"Module "fw" (Firewall)" on page 383*.
`tcp`	TCP processing messages
`tcpinfo`	TCP processing messages - more detailed description

Flag	Description
`timer`	Reports of internal timer ticks **Warning** - Prints many messages, without real content.
`warning`	General warnings

Module "cpcode" (Data Loss Prevention - CPcode)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m cpcode + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m cpcode + {all | <List of Debug Flags>}
```

Note - In addition, see:

- *"Module "dlpda" (Data Loss Prevention - Download Agent for Content Awareness)" on page 373*
- *"Module "dlpk" (Data Loss Prevention - Kernel Space)" on page 375*
- *"Module "dlpuk" (Data Loss Prevention - User Space)" on page 376*

Flag	Description
`cplog`	Resolving of names and IP addresses for Check Point logs
`csv`	Creation of CSV files
`echo`	Prints the function that called the CPcode module
`error`	General errors
`init`	Initializing of CPcode system
`io`	Input / Output functionality for CPcode module
`ioctl`	IOCTL control messages to kernel
`kisspm`	Kernel Infrastructure Pattern Matcher
`memory`	Memory allocation operations
`persist`	Operations on persistence domains
`policy`	Policy operations
`run`	Policy operations
`url`	Operations on URLs
`vm`	Virtual Machine execution

Flag	Description
`warning`	General warnings

Module "CPSSH" (SSH Inspection)

R80.40 introduced SSH Deep Packet Inspection - decryption / encryption of SSH, extraction of files from SFTP/SCP, blocking of SSH port forwarding, and so on.

For more information, see the *R82 Threat Prevention Administration Guide*.

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m CPSSH + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m CPSSH + {all | <List of Debug Flags>}
```

Important - In addition, enable the debug flag "`cpsshi`" in *"Module "fw" (Firewall)" on page 383*.

Flag	Description
`authentication`	Detailed information about authentication
`binary_packet`	Detailed information about packets
`conn_proto`	Detailed information about connections
`crypto`	Encryption and decryption **Note** - In addition, see *"Module "crypto" (SSL Inspection)" on page 372*.
`dump`	Dumps the connection buffer
`error`	General errors
`info`	General information
`mux_auth_app`	Information about authentication **Note** - In addition, see *"Module "MUX" (Multiplexer for Applications Traffic)" on page 404*.
`mux_conn_app`	Information about connections **Note** - In addition, see *"Module "MUX" (Multiplexer for Applications Traffic)" on page 404*.

Flag	Description
`mux_decrypt_app`	Information about decryption of connections **Note** - In addition, see *"Module "MUX" (Multiplexer for Applications Traffic)" on page 404*.
`mux_encrypt_app`	Information about encryption of connections **Note** - In addition, see *"Module "MUX" (Multiplexer for Applications Traffic)" on page 404*.
`mux_inf`	Internal flow **Note** - In addition, see *"Module "MUX" (Multiplexer for Applications Traffic)" on page 404*.
`mux_ssh_parser_app`	*Currently is not used*
`mux_stream`	Internal flow **Note** - In addition, see *"Module "MUX" (Multiplexer for Applications Traffic)" on page 404*.
`probe`	Information about connections
`session`	Internal flow
`sftp_parser`	Parser of SFTP / SCP connections
`state_machine`	Information about the module State Machine
`trans_proto`	Information about client and server communication
`warning`	General warnings

Module "crypto" (SSL Inspection)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m crypto + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m crypto + {all | <List of Debug Flags>}
```

Flag	Description
`error`	General errors
`info`	General information
`warning`	General warnings

Module "dlpda" (Data Loss Prevention - Download Agent for Content Awareness)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m dlpda + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m dlpda + {all | <List of Debug Flags>}
```

Note - In addition, see:

- *"Module "cpcode" (Data Loss Prevention - CPcode)" on page 368*
- *"Module "dlpk" (Data Loss Prevention - Kernel Space)" on page 375*
- *"Module "dlpuk" (Data Loss Prevention - User Space)" on page 376*

Flag	Description
`address`	Information about connection's IP address
`cmi`	Context Management Interface / Infrastructure operations
`coverage`	Coverage times (entering, blocking, and time spent)
`ctx`	Operations on DLP context
`engine`	Content Awareness engine module
`error`	General errors
`filecache`	Content Awareness file caching
`info`	General information
`memory`	Memory allocation operations
`mngr`	*Currently is not used*
`module`	Initiation / removal of the Content Awareness infrastructure
`observer`	Classification Object (CLOB) observer (data classification)

Flag	Description
`policy`	Content Awareness policy
`slowpath`	*Currently is not used*
`subject`	Prints the debug subject of each debug message
`timestamp`	Prints the timestamp for each debug message (changes when you enable the debug flag '`coverage`')
`verbose`	Prints additional information (used with other debug flags)
`vs`	Prints the VSID of the debugged Virtual System
`warning`	General warnings

Module "dlpk" (Data Loss Prevention - Kernel Space)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m dlpk + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m dlpk + {all | <List of Debug Flags>}
```

Note - In addition, see:

- *"Module "cpcode" (Data Loss Prevention - CPcode)" on page 368*
- *"Module "dlpda" (Data Loss Prevention - Download Agent for Content Awareness)" on page 373*
- *"Module "dlpuk" (Data Loss Prevention - User Space)" on page 376*

Flag	Description
`cmi`	HTTP Proxy, connection redirection, identity information, Async
`drv`	DLP inspection
`error`	General errors
`identity`	User identity, connection identity, Async
`rulebase`	DLP rulebase match
`stat`	Counter statistics

Module "dlpuk" (Data Loss Prevention - User Space)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m dlpuk + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m dlpuk + {all | <List of Debug Flags>}
```

Note - In addition, see:

- *"Module "cpcode" (Data Loss Prevention - CPcode)" on page 368*
- *"Module "dlpda" (Data Loss Prevention - Download Agent for Content Awareness)" on page 373*
- *"Module "dlpk" (Data Loss Prevention - Kernel Space)" on page 375*

Flag	Description
`address`	Information about connection's IP address
`buffer`	*Currently is not used*
`coverage`	Coverage times (entering, blocking, and time spent)
`error`	General errors
`info`	General information
`memory`	Memory allocation operations
`module`	Initiation / removal of the Data Loss Prevention User Space modules' infrastructure
`policy`	*Currently is not used*
`serialize`	Data buffers and data sizes
`subject`	Prints the debug subject of each debug message
`timestamp`	Prints the timestamp for each debug message (changes when you enable the debug flag '`coverage`')
`verbose`	Prints additional information (used with other debug flags)
`vs`	Prints the VSID of the debugged Virtual System

Flag	Description
`warning`	General warnings

Module "DOMO" (Domain Objects)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m DOMO + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m DOMO + {all | <List of Debug Flags>}
```

Flag	Description
`address`	Information about connection's IP address
`conn`	Internal processing of connections
`coverage`	Coverage times (entering, blocking, and time spent)
`error`	General errors
`info`	General information
`memory`	Memory allocation operations
`module`	Operations in the Domain Objects module (initialization, module loading, calls to the module, policy loading, and so on)
`policy`	*Currently is not used*
`subject`	Prints the debug subject of each debug message
`timestamp`	Prints the timestamp for each debug message (changes when you enable the debug flag '`coverage`')
`verbose`	Prints additional information (used with other debug flags)
`vs`	Prints the VSID of the debugged Virtual System
`warning`	General warnings

Module "fg" (FloodGate-1 - QoS)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m fg + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m fg + {all | <List of Debug Flags>}
```

Flag	Description
`chain`	Tracing each packet through FloodGate-1 stages in the cookie chain
`chainq`	Internal Chain Queue mechanism - holding and releasing of packets during critical actions (policy installation and uninstall)
`classify`	Classification of connections to QoS rules
`conn`	Processing and identification of connection
`dns`	DNS classification mechanism
`drops`	Dropped packets due to WFRED policy
`dropsv`	Dropped packets due to WFRED policy - with additional debug information (verbose)
`error`	General errors
`flow`	Internal flow of connections (direction, interfaces, buffers, and so on)
`fwrate`	Rate statistics for each interface and direction
`general`	*Currently is not used*
`install`	Policy installation
`llq`	Low latency queuing
`log`	Everything related to calls in the log
`ls`	Processing of connections in ClusterXL in Load Sharing Mode
`memory`	Memory allocation operations

Flag	Description
`multik`	Processing of connections in CoreXL Firewall instances **Notes:** ■ In addition, see *"Module "multik" (Multi-Kernel Inspection - CoreXL)" on page 402*. ■ In a cluster, enable the debug flag "`multik`" in the *"Module "cluster" (ClusterXL)" on page 361*. ■ If you use the IPsec VPN Software Blade, enable the debug flag "`multik`" in the *"Module "VPN" (Site-to-Site VPN and Remote Access VPN)" on page 423*.
`pkt`	Packet recording mechanism
`policy`	QoS policy rules matching
`qosaccel`	Acceleration of QoS traffic
`rates`	Rule and connection rates (IQ Engine behavior and status)
`rtm`	Failures in information gathering in the Real Time Monitoring module **Note** - In addition, see *"Module "RTM" (Real Time Monitoring)" on page 410*.
`sched`	Basic scheduling information
`tcp`	TCP streaming (re-transmission detection) mechanism
`time`	*Currently is not used*
`timers`	Reports of internal timer ticks **Warning** - Prints many messages, without real content.
`url`	URL and URI for QoS classification
`verbose`	Prints additional information (used with other debug flags)

Module "FILE_SECURITY" (File Inspection)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m FILE_SECURITY + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m FILE_SECURITY + {all | <List of Debug Flags>}
```

Note - In addition, see *"Module "WSIS" (Web Intelligence Infrastructure)" on page 431*.

Flag	Description
`conn`	Internal processing of connections
`cache`	File cache
`coverage`	Coverage times (entering, blocking, and time spent)
`error`	General errors
`global`	Global operations
`info`	General information
`memory`	Memory allocation operations
`module`	Operations in the FILE_SECURITY module (identification and processing of connections)
`subject`	Prints the debug subject of each debug message
`timestamp`	Prints the timestamp for each debug message (changes when you enable the debug flag '`coverage`')
`verbose`	Prints additional information (used with other debug flags)
`vs`	Prints the VSID of the debugged Virtual System
`warning`	General warnings

Module "FILEAPP" (File Application)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m FILEAPP + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m FILEAPP + {all | <List of Debug Flags>}
```

Flag	Description
`address`	Information about connection's IP address
`coverage`	Coverage times (entering, blocking, and time spent)
`error`	General errors
`filetype`	Information about processing a file type
`global`	Allocation and creation of global object
`info`	General information
`memory`	Memory allocation operations
`module`	Operations in the FILEAPP module (initialization, module loading, calls to the module, and so on)
`normalize`	File normalization operations (internal operations)
`parser`	File parsing
`subject`	Prints the debug subject of each debug message
`timestamp`	Prints the timestamp for each debug message (changes when you enable the debug flag '`coverage`')
`upload`	File upload operations
`verbose`	Prints additional information (used with other debug flags)
`vs`	Prints the VSID of the debugged Virtual System
`warning`	General warnings

Module "fw" (Firewall)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m fw + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m fw + {all | <List of Debug Flags>}
```

Flag	Description
`acct`	Accounting data in logs for Application Control (in addition, enable the debug of *"Module "APPI" (Application Control Inspection)" on page 356*)
`advp`	Advanced Patterns (signatures over port ranges) - runs under ASPII and CMI
`aspii`	Accelerated Stateful Protocol Inspection Infrastructure (INPSECT streaming)
`balance`	ConnectControl - logical servers in kernel, load balancing
`bridge`	Bridge mode
`bypass_ timer`	Universal Bypass on CoreXL Firewall Instances during load
`caf`	Mirror and Decrypt feature - only mirror operations on all traffic
`cgnat`	Carrier Grade NAT (CGN/CGNAT)
`chain`	Connection Chain modules, cookie chain
`chainfwd`	Chain forwarding - related to cluster kernel parameter `fwha_perform_ chain_forwarding`
`cifs`	Processing of Microsoft Common Internet File System (CIFS) protocol
`citrix`	Processing of Citrix connections
`cmi`	Context Management Interface / Infrastructure - IPS signature manager
`conn`	Processing of all connections

Flag	Description
connstats	Connections statistics for Evaluation of Heavy Connections in CPView (see sk105762)
content	Anti-Virus content inspection
context	Operations on Memory context and CPU context in *"Module "kiss" (Kernel Infrastructure)" on page 397*
cookie	Virtual de-fragmentation , cookie issues (cookies in the data structure that holds the packets)
corr	Correction layer
cpsshi	SSH Inspection **Important** - In addition, enable all the debug flags in *"Module "CPSSH" (SSH Inspection)" on page 370*.
cptls	CRYPTO-PRO Transport Layer Security (HTTPS Inspection) - Russian VPN GOST
crypt	Encryption and decryption of packets (algorithms and keys are printed in clear text and cipher text)
cvpnd	Processing of connections handled by the Mobile Access daemon
dfilter	Operations in the debug filters (see *"Kernel Debug Filters" on page 328*)
dlp	Processing of Data Loss Prevention connections
dmd	Information about offloading of connections from the Firewall FWK process to the DMD (Dual Mode Job Dispatcher) process
dnstun	DNS tunnels
domain	DNS queries
dos	DDoS attack mitigation (part of IPS)
driver	Check Point kernel attachment (access to kernel is shown as log entries)
drop	Reason for (almost) every dropped packet
drop_tmpl	Operations in Drop Templates
dynlog	Dynamic log enhancement (INSPECT logs)
epq	End Point Quarantine (and AMD)

Flag	Description
`error`	General errors
`event`	Event App features (DNS, HTTP, SMTP, FTP)
`ex`	Expiration issues (time-outs) in dynamic kernel tables
`fast_accel`	Fast acceleration of connections
`filter`	Packet filtering performed by the Check Point kernel and all data loaded into kernel
`ftp`	Processing of FTP Data connections (used to call applications over FTP Data - i.e., Anti-Virus)
`handlers`	Operations related to the Context Management Interface / Infrastructure Loader **Note** - In addition, see *"Module "cmi_loader" (Context Management Interface / Infrastructure Loader)" on page 364*.
`highavail`	Cluster configuration - changes in the configuration and information about interfaces during traffic processing
`hold`	Holding mechanism and all packets being held / released
`icmptun`	ICMP tunnels
`if`	interface-related information (accessing the interfaces, installing a filter on an interfaces)
`install`	Driver installation - NIC attachment (actions performed by the "`fw ctl install`" and "`fw ctl uninstall`" commands)
`integrity`	Integrity Client (enforcement cooperation)
`ioctl`	IOCTL control messages (communication between kernel and daemons, loading and unloading of the FireWall)
`ipopt`	Enforcement of IP Options
`ips`	IPS logs and IPS IOCTL
`ipv6`	Processing of IPv6 traffic
`kbuf`	Kernel-buffer memory pool (for example, encryption keys use these memory allocations)

Flag	Description
`ld`	Kernel dynamic tables infrastructure (reads from / writes to the tables) **Warning** - Security Gateway can freeze or hang due to very high CPU load!.
`leaks`	Memory leak detection mechanism
`link`	Creation of links in Connections kernel table (ID 8158)
`log`	Everything related to calls in the log
`machine`	INSPECT Virtual Machine (actual assembler commands being processed) **Warning** - Security Gateway can freeze or hang due to very high CPU load!.
`mail`	Issues with e-mails over POP3, IMAP
`malware`	Matching of connections to Threat Prevention Layers (multiple rulebases) **Note** - In addition, see *"Module "MALWARE" (Threat Prevention)" on page 401*.
`mdps`	Management Data Plane Separation (sk138672)
`media`	*Does not apply anymore* Only on Security Gateway that runs on Windows OS: Transport Driver Interface information (interface-related information)
`memory`	Memory allocation operations
`mgcp`	Media Gateway Control Protocol (complementary to H.323 and SIP)
`misc`	Miscellaneous helpful information (not shown with other debug flags)
`misp`	ISP Redundancy
`monitor`	Prints output similar to the "`fw monitor`" command (see the *R82 CLI Reference Guide* > section "fw monitor") **Note** - In addition, enable the debug flag "`misc`" in this module.
`monitorall`	Prints output similar to the "`fw monitor -p all`" command (see the *R82 CLI Reference Guide* > section "fw monitor") **Note** - In addition, enable the debug flag "`misc`" in this module.

Flag	Description
`mrtsync`	Synchronization between cluster members of Multicast Routes that are added when working with Dynamic Routing Multicast protocols
`msnms`	MSN over MSMS (MSN Messenger protocol) In addition, always enable the debug flag '`sip`' in this module
`multik`	Processing of connections in CoreXL Firewall instances **Notes:** ■ This debug flag enables all the debug flags in the *"Module "multik" (Multi-Kernel Inspection - CoreXL)" on page 402*, except for the debug flag "`packet`". ■ In a cluster, enable the debug flag "`multik`" in the *"Module "cluster" (ClusterXL)" on page 361*. ■ If you use the IPsec VPN Software Blade, enable the debug flag "`multik`" in the *"Module "VPN" (Site-to-Site VPN and Remote Access VPN)" on page 423*. ■ If you use the QoS Software Blade, enable the debug flag "`multik`" in the *"Module "fg" (FloodGate-1 - QoS)" on page 379*.
`nac`	Network Access Control (NAC) feature in Identity Awareness
`nat`	NAT issues - basic information
`nat_ hitcount`	Hit Count in NAT Rule Base
`nat_sync`	NAT issues - NAT port allocation operations in Check Point cluster
`nat64`	NAT issues - 6in4 tunnels (IPv6 over IPv4) and 4in6 tunnels (IPv4 over IPv6)
`netquota`	IPS protection "Network Quota"
`ntup`	Non-TCP / Non-UDP traffic policy (traffic parser)
`packet`	Actions performed on packets (like Accept, Drop, Fragment)
`packval`	Stateless verifications (sequences, fragments, translations and other header verifications)
`portscan`	Prevention of port scanning
`prof`	Connection profiler for Firewall Priority Queues (see sk105762)

Flag	Description
`q`	Driver queue (for example, cluster synchronization operations) This debug flag is crucial for the debug of Check Point cluster synchronization issues
`qos`	QoS (FloodGate-1)
`rad`	Resource Advisor policy (for Application Control, URL Filtering, and others)
`route`	Routing issues This debug flag is crucial for the debug of ISP Redundancy issues
`sam`	Suspicious Activity Monitoring
`sctp`	Processing of Stream Control Transmission Protocol (SCTP) connections
`scv`	SecureClient Verification
`shmem`	*Currently is not used*
`sip`	VoIP traffic - SIP and H.323 **Note** - In addition, see: ■ *"Module "h323" (VoIP H.323)" on page 392* ■ *"Module "WS_SIP" (Web Intelligence VoIP SIP Parser)" on page 429*
`smtp`	Issues with e-mails over SMTP
`sock`	Sockstress TCP DoS attack (CVE-2008-4609)
`span`	Monitor mode (mirror / span port)
`spii`	Stateful Protocol Inspection Infrastructure and INSPECT Streaming Infrastructure
`synatk`	IPS protection 'SYN Attack' (SYNDefender) **Note** - In addition, see *"Module "synatk" (Accelerated SYN Defender)" on page 415*.
`sync`	Synchronization operations in Check Point cluster **Note** - In addition, see the debug flag "`sync`" in *"Module "CPAS" (Check Point Active Streaming)" on page 366*.
`tcpstr`	TCP streaming mechanism

Flag	Description
`te`	Prints the name of an interface for incoming connection from Threat Emulation Machine
`tlsparser`	*Currently is not used*
`tp_container`	Operations in the Threat Prevention container
`ua`	Processing of Universal Alcatel "UA" connections
`ucd`	Processing of UserCheck connections in Check Point cluster
`unibypass`	Universal Bypass on CoreXL Firewall Instances during load
`user`	User Space communication with Kernel Space (most useful for configuration and VSX debug)
`vm`	Virtual Machine chain decisions on traffic going through the `fw_filter_chain`
`wap`	Processing of Wireless Application Protocol (WAP) connections
`warning`	General warnings
`wire`	Wire-mode Virtual Machine chain module
`xlate`	NAT issues - basic information
`xltrc`	NAT issues - additional information - going through NAT rulebase

Module "gtp" (GPRS Tunneling Protocol)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m gtp + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m gtp + {all | <List of Debug Flags>}
```

Flag	Description
`capacity`	Memory capacity to contain the required information and Aggressive Aging
`create`	GTPv0 / GTPv1 create PDP context
`create2`	GTPv2 create session
`dbg`	GTP debug mechanism
`delete`	GTPv0 / GTPv1 delete PDP context
`delete2`	GTPv2 delete session
`error`	General GTP errors
`ioctl`	GTP IOCTL commands
`ld`	Operations with GTP kernel tables (addition, removal, modification of entries)
`log`	GTPv0 / GTPv1 logging
`log2`	GTPv2 logging
`modify`	GTPv2 modify bearer
`other`	GTPv0 / GTPv1 other messages
`other2`	GTPv2 other messages
`packet`	GTP main packet flow
`parse`	GTPv0 / GTPv1 parsing
`parse2`	GTPv2 parsing

Flag	Description
`policy`	Policy installation
`state`	GTPv0 / GTPv1 dispatching
`state2`	GTPv2 dispatching
`sxl`	Processing of GTP connections in SecureXL
`tpdu`	GTP T-PDU
`update`	GTPv0 / GTPv1 update PDP context

Module "h323" (VoIP H.323)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m h323 + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m h323 + {all | <List of Debug Flags>}
```

Flag	Description
`align`	General VoIP debug messages (for example, VoIP infrastructure)
`cpas`	Debug messages about the CPAS TCP **Important** - This debug flag is **not** included when you use the syntax "`fw ctl debug -m h323 all`"
`decode`	H.323 decoder messages
`error`	General errors
`h225`	H225 call signaling messages (`SETUP`, `CONNECT`, `RELEASE COMPLETE`, and so on)
`h245`	H245 control signaling messages (`OPEN LOGICAL CHANNEL`, `END SESSION COMMAND`, and so on)
`init`	Internal errors
`ras`	H225 RAS messages (`REGISTRATION`, `ADMISSION`, and `STATUS REQUEST / RESPONSE`)

Module "ICAP_CLIENT" (Internet Content Adaptation Protocol Client)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m ICAP_CLIENT + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m ICAP_CLIENT + {all | <List of Debug Flags>}
```

Flag	Description
`address`	Information about connection's IP address
`blade`	Internal operations in the ICAP Client module
`coverage`	Coverage times (entering, blocking, and time spent)
`cpas`	Check Point Active Streaming (CPAS) **Note** - In addition, see *"Module "CPAS" (Check Point Active Streaming)" on page 366*.
`daf_cmi`	Mirror and Decrypt of HTTPS traffic - operations related to the Context Management Interface / Infrastructure Loader **Note** - In addition, see *"Module "cmi_loader" (Context Management Interface / Infrastructure Loader)" on page 364*.
`daf_module`	Mirror and Decrypt of HTTPS traffic - operations related to the ICAP Client module
`daf_policy`	Mirror and Decrypt of HTTPS traffic - operations related to policy installation
`daf_rulebase`	Mirror and Decrypt of HTTPS traffic - operations related to rulebase
`daf_tcp`	Mirror and Decrypt of HTTPS traffic - internal processing of TCP connections
`error`	General errors
`global`	Global operations in the ICAP Client module

Flag	Description
`icap`	Processing of ICAP connections
`info`	General information
`memory`	Memory allocation operations
`module`	Operations in the ICAP Client module (initialization, module loading, calls to the module, and so on)
`policy`	Policy installation
`subject`	Prints the debug subject of each debug message
`timestamp`	Prints the timestamp for each debug message (changes when you enable the debug flag '`coverage`')
`trick`	Data Trickling mode
`verbose`	Prints additional information (used with other debug flags)
`vs`	Prints the VSID of the debugged Virtual System
`warning`	General warnings

Module "IDAPI" (Identity Awareness API)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m IDAPI + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m IDAPI + {all | <List of Debug Flags>}
```

Flag	Description
`address`	Information about connection's IP address
`async`	Checking for known networks
`classifier`	Data classification
`clob`	Classification Object (CLOB) observer (data classification)
`coverage`	Coverage times (entering, blocking, and time spent)
`data`	Portal, IP address matching for Terminal Servers Identity Agent, session handling
`error`	General errors
`htab`	Checking for network IP address, working with kernel tables
`info`	General information
`log`	Various logs for internal operations
`memory`	Memory allocation operations
`module`	Removal of the Identity Awareness API debug module's infrastructure, failure to convert to Base64, failure to append Source to Destination, and so on
`observer`	Data classification observer
`subject`	Prints the debug subject of each debug message
`test`	IP test, Identity Awareness API synchronization

Flag	Description
`timestamp`	Prints the timestamp for each debug message (changes when you enable the debug flag '`coverage`')
`verbose`	Prints additional information (used with other debug flags)
`vs`	Prints the VSID of the debugged Virtual System
`warning`	General warnings
`xff`	Processing of X-Forwarded-For (XFF) headers

Module "kiss" (Kernel Infrastructure)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m kiss + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m kiss + {all | <List of Debug Flags>}
```

Note - In addition, see *"Module "kissflow" (Kernel Infrastructure Flow)" on page 400*.

Flag	Description
`accel_pm`	Accelerated Pattern Matcher
`bench`	CPU benchmark
`connstats`	Statistics for connections
`cookie`	Virtual de-fragmentation , cookie issues (cookies in the data structure that holds the packets)
`dbg_filter`	Information about the configured Debug Filters - *"Kernel Debug Filters" on page 328*
`dfa`	Pattern Matcher (Deterministic Finite Automaton) compilation and execution
`driver`	Loading / unloading of the FireWall driver
`error`	General errors
`flofiler`	FLow prOFILER
`ghtab`	Multi-threaded safe global hash tables
`ghtab_bl`	Internal operations on global hash tables
`handles`	Memory pool allocation for tables
`htab`	Multi-threaded safe hash tables
`htab_bl`	Internal operations on hash tables

Flag	Description
`htab_bl_err`	Errors and failures during internal operations on hash tables
`htab_bl_exp`	Expiration in hash tables
`htab_bl_infra`	Errors and failures during internal operations on hash tables
`htab_bl_warn`	Warnings during internal operations on hash tables
`ioctl`	IOCTL control messages (communication between the kernel and daemons)
`kqstats`	Kernel Worker thread statistics (resetting, initializing, turning off)
`kw`	Kernel Worker state and Pattern Matcher inspection
`leak`	Memory leak detection mechanism
`memory`	Memory allocation operations
`memprof`	Memory allocation operations in the Memory Profiler (when the kernel parameter `fw_conn_mem_prof_enabled=1`)
`misc`	CPU counters, Memory counters, getting/setting of global kernel parameters
`mtctx`	Multi-threaded context - memory allocation, reference count
`packet`	Internal parsing operations on packets
`pcre`	Perl Compatible Regular Expressions (execution, memory allocation)
`pm`	Pattern Matcher compilation and execution
`pmdump`	Pattern Matcher DFA (dumping XMLs of DFAs)
`pmint`	Pattern Matcher compilation
`pools`	Memory pool allocation operations
`queue`	Kernel Worker thread queues
`rem`	Regular Expression Matcher - Pattern Matcher 2nd tier (slow path)
`salloc`	System Memory allocation

Flag	Description
`shmem`	Shared Memory allocation
`sm`	String Matcher - Pattern Matcher 1st tier (fast path)
`stat`	Statistics for categories and maps
`swblade`	Registration of Software Blades
`thinnfa`	*Currently is not used*
`thread`	Kernel thread that supplies low level APIs to the kernel thread
`timers`	Internal timers
`usrmem`	User Space platform memory usage
`vbuf`	Virtual buffer
`warning`	General warnings
`worker`	Kernel Worker - queuing and dequeuing
`zeco`	Memory allocations in the Zero-Copy kernel module

Module "kissflow" (Kernel Infrastructure Flow)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m kissflow + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m kissflow + {all | <List of Debug Flags>}
```

Note - In addition, see *"Module "kiss" (Kernel Infrastructure)" on page 397*.

Flag	Description
`compile`	Pattern Matcher (pattern compilation)
`dfa`	Pattern Matcher (Deterministic Finite Automaton) compilation and execution
`error`	General errors
`memory`	Memory allocation operations
`pm`	Pattern Matcher - general information
`warning`	General warnings

Module "MALWARE" (Threat Prevention)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m MALWARE + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m MALWARE + {all | <List of Debug Flags>}
```

Flag	Description
`address`	Information about connection's IP address
`av`	*Currently is not used*
`coverage`	Coverage times (entering, blocking, and time spent)
`error`	General errors
`global`	Prints parameters from the `$FWDIR/conf/mail_security_config` file
`info`	General information
`ioc`	Operations on Indicators of Compromise (IoC)
`memory`	*Currently is not used*
`module`	Removal of the MALWARE module's debug infrastructure
`policy`	Policy installation
`subject`	Prints the debug subject of each debug message
`te`	*Currently is not used*
`timestamp`	Prints the timestamp for each debug message (changes when you enable the debug flag '`coverage`')
`verbose`	Prints additional information (used with other debug flags)
`vs`	Prints the VSID of the debugged Virtual System
`warning`	General warnings

Module "multik" (Multi-Kernel Inspection - CoreXL)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m multik + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m multik + {all | <List of Debug Flags>}
```

Notes:

- When you enable the debug flag '`multik`' in the *"Module "fw" (Firewall)" on page 383*, it enables all the debug flags in this debug module, except for the debug flag '`packet`'.
- In a cluster, enable the debug flag "`multik`" in the *"Module "cluster" (ClusterXL)" on page 361*.
- If you use the IPsec VPN Software Blade, enable the debug flag "`multik`" in the *"Module "VPN" (Site-to-Site VPN and Remote Access VPN)" on page 423*.
- If you use the QoS Software Blade, enable the debug flag "`multik`" in the *"Module "fg" (FloodGate-1 - QoS)" on page 379*.

Flag	Description
`api`	Registration and unregistration of cross-instance function calls
`cache_tab`	Cache table infrastructure
`conn`	Creation and deletion of connections in the dispatcher table
`counter`	Cross-instance counter infrastructure
`dumbo`	Shows the selected CoreXL Firewall instance
`error`	General errors
`event`	Cross-instance event aggregation infrastructure
`fwstats`	Firewall statistics
`ioctl`	Distribution of IOCTLs to different CoreXL Firewall instances
`lock`	Obtaining and releasing the `fw_lock` on multiple CoreXL Firewall instances

Flag	Description
`message`	Cross-instance messages (used for local sync and port scanning)
`packet`	For each packet, shows the CoreXL SND dispatching decision (CoreXL Firewall instance and reason)
`packet_err`	Invalid packets, for CoreXL SND could not make a dispatching decision
`prio`	Firewall Priority Queues (refer to sk105762)
`queue`	Packet queue
`quota`	Cross-instance quota table (used by the Network Quota feature)
`route`	Routing of packets
`state`	Starting and stopping of CoreXL Firewall instances, establishment of relationship between CoreXL Firewall instances
`temp_conns`	Temporary connections
`uid`	Cross-instance Unique IDs
`vpn_multik`	MultiCore VPN (see sk118097)

Module "MUX" (Multiplexer for Applications Traffic)

R80.20 introduced a new layer between the Streaming layer and the Applications layer - MUX (Multiplexer).

Applications are registered to the Streaming layer through the MUX layer.

The MUX layer chooses to work over PSL (passive streaming) or CPAS (active streaming).

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m MUX + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m MUX + {all | <List of Debug Flags>}
```

Flag	Description
`active`	CPAS (active streaming) **Note** - In addition, see *"Module "CPAS" (Check Point Active Streaming)" on page 366*.
`advp`	Advanced Patterns (signatures over port ranges)
`api`	API calls
`comm`	Information about opening and closing of connections
`error`	General errors
`http_ disp`	HTTP Dispatcher
`misc`	Miscellaneous helpful information (not shown with other debug flags)
`passive`	PSL (passive streaming) **Note** - In addition, see *"Module "PSL" (Passive Streaming Library)" on page 408*.
`proxy_tp`	Proxy tunnel parser
`stream`	General information about the data stream
`test`	*Currently is not used*

Flag	Description
`tier1`	Pattern Matcher 1st tier (fast path)
`tls`	General information about the TLS
`tlsp`	TLS parser
`tol`	Test Object List algorithm (to determine whether an application is malicious or not)
`udp`	UDP parser
`warning`	General warnings
`ws`	Web Intelligence

Module "NRB" (Next Rule Base)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m NRB + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m NRB + {all | <List of Debug Flags>}
```

Flag	Description
`address`	Information about connection's IP address
`appi`	Rules and applications **Note** - In addition, see *"Module "APPI" (Application Control Inspection)" on page 356*.
`coverage`	Coverage times (entering, blocking, and time spent)
`dlp`	Data Loss Prevention **Note** - In addition, see: ■ *"Module "dlpda" (Data Loss Prevention - Download Agent for Content Awareness)" on page 373* ■ *"Module "dlpk" (Data Loss Prevention - Kernel Space)" on page 375* ■ *"Module "dlpuk" (Data Loss Prevention - User Space)" on page 376*
`error`	General errors
`info`	General information
`match`	Rule matching
`memory`	Memory allocation operations
`module`	Operations in the NRB module (initialization, module loading, calls to the module, contexts, and so on)
`policy`	Policy installation
`sec_rb`	Security rulebase

Flag	Description
`session`	Session layer
`ssl_insp`	HTTPS Inspection
`subject`	Prints the debug subject of each debug message
`timestamp`	Prints the timestamp for each debug message (changes when you enable the debug flag '`coverage`')
`verbose`	Prints additional information (used with other debug flags)
`vs`	Prints the VSID of the debugged Virtual System
`warning`	General warnings

Module "PSL" (Passive Streaming Library)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m PSL + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m PSL + {all | <List of Debug Flags>}
```

Note - In addition, see *"Module "MUX" (Multiplexer for Applications Traffic)" on page 404*.

Flag	Description
`drop`	Information about dropped packets
`error`	General errors
`pkt`	Processing of packets
`seq`	Processing of TCP sequence numbers
`stats`	Prints statistics about each PSL connection
`tcpstr`	Processing of TCP streams
`warning`	General warnings

Module "RAD_KERNEL" (Resource Advisor - Kernel Space)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m RAD_KERNEL + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m RAD_KERNEL + {all | <List of Debug Flags>}
```

Flag	Description
`address`	Information about connection's IP address
`cache`	RAD kernel malware cache
`coverage`	Coverage times (entering, blocking, and time spent)
`error`	General errors
`global`	RAD global context
`info`	General information
`malmis`	Information about missed hits in malware cache
`memory`	Memory allocation operations
`subject`	Prints the debug subject of each debug message
`timestamp`	Prints the timestamp for each debug message (changes when you enable the debug flag '`coverage`')
`verbose`	Prints additional information (used with other debug flags)
`vs`	Prints the VSID of the debugged Virtual System
`warning`	General warnings

Module "RTM" (Real Time Monitoring)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m RTM + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m RTM + {all | <List of Debug Flags>}
```

Flag	Description
`accel`	Prints SecureXL information about the accelerated packets, connections, and so on
`chain`	Prints information about chain registration and about the E2E (Virtual Link) chain function actions **Note** - This important debug flag helps you know, whether the E2E identifies the Virtual Link packets
`con_conn`	Prints messages for each connection (when a new connection is handled by the RTM module) The same debug flags as '`per_conn`'
`driver`	Check Point kernel attachment (access to kernel is shown as log entries)
`err`	General errors
`import`	Importing of the data from other kernel modules (FireWall, QoS)
`init`	Initialization of the RTM module
`ioctl`	IOCTL control messages
`netmasks`	Information about how the RTM handles netmasks, if you are monitoring an object of type Network
`per_conn`	Prints messages for each connection (when a new connection is handled by the RTM module) The same debug flags as '`con_conn`'

Flag	Description
`per_pckt`	Prints messages for each packet (when a new packet arrives) **Warning** - Prints many messages, which increases the load on the CPU
`performance`	*Currently is not used*
`policy`	Prints messages about loading and unloading on the FireWall module (indicates that the RTM module received the FireWall callback)
`rtm`	Real time monitoring
`s_err`	General errors about kernel tables and other failures
`sort`	Sorting of "Top XXX" counters
`special`	Information about how the E2E modifies the E2ECP protocol packets
`tabs`	*Currently is not used*
`topo`	Calculation of network topography
`view_add`	Adding or deleting of a View
`view_update`	Updating of Views with new information
`view_update1`	Updating of Views with new information
`wd`	WebDefense views

Module "seqvalid" (TCP Sequence Validator and Translator)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m seqvalid + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m seqvalid + {all | <List of Debug Flags>}
```

Flag	Description
`error`	General errors
`seqval`	TCP sequence validation and translation
`sock`	*Currently is not used*
`warning`	General warnings

Module "SFT" (Stream File Type)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m SFT + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m SFT + {all | <List of Debug Flags>}
```

Flag	Description
`error`	General errors
`fatal`	Fatal errors
`info`	General information
`mgr`	Rule match, database, connection processing, classification
`warning`	General warnings

Module "SGEN" (Struct Generator)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m SGEN + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m SGEN + {all | <List of Debug Flags>}
```

Flag	Description
`engine`	Struct Generator engine operations on objects
`error`	General errors
`fatal`	Fatal errors
`field`	Operations on fields
`general`	General types macros
`info`	General information
`load`	Loading of macros
`serialize`	Serialization while loading the macros
`warning`	General warnings

Module "synatk" (Accelerated SYN Defender)

For additional information, see *R82 Performance Tuning Administration Guide* - Chapter *SecureXL* - Section *Accelerated SYN Defender*.

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m synatk + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m synatk + {all | <List of Debug Flags>}
```

Flag	Description
`cookie`	TCP SYN Cookie
`error`	General errors
`radix_dump`	Dump of the radix tree
`radix_match`	Matched items in the radix tree
`radix_modify`	Operations in the radix tree
`warning`	General warnings

Module "TPUTILS" (Threat Prevention Utilities)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m TPUTILS + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m TPUTILS + {all | <List of Debug Flags>}
```

Flag	Description
`address`	Information about connection's IP address
`bloom`	Bloom filter operations
`coverage`	Coverage times (entering, blocking, and time spent)
`error`	General errors (the connection is probably rejected)
`global`	Handling of global structure (usually, related to policy)
`info`	General information
`memory`	Memory allocation operations
`module`	Operations in the TPUTILS module (initialization, module loading, calls to the module, policy loading, and so on)
`subject`	Prints the debug subject of each debug message
`timestamp`	Prints the timestamp for each debug message (changes when you enable the debug flag '`coverage`')
`uuid`	Session UUID
`vs`	Prints the VSID of the debugged Virtual System
`warning`	General warnings

Module "UC" (UserCheck)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m UC + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m UC + {all | <List of Debug Flags>}
```

Flag	Description
`address`	Information about connection's IP address
`coverage`	Coverage times (entering, blocking, and time spent)
`error`	General errors
`htab`	Hash table
`info`	General information
`memory`	Memory allocation operations
`module`	Operations in the UserCheck module (initialization, UserCheck table hits, finding User ID in cache, removal of UserCheck debug module's infrastructure)
`subject`	Prints the debug subject of each debug message
`timestamp`	Prints the timestamp for each debug message (changes when you enable the debug flag '`coverage`')
`verbose`	Prints additional information (used with other debug flags)
`vs`	Prints the VSID of the debugged Virtual System
`warning`	General warnings
`webapi`	URL patterns, UserCheck incidents, connection redirection

Module "UP" (Unified Policy)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m UP + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m UP + {all | <List of Debug Flags>}
```

Note - In addition, see:

- *"Module "upconv" (Unified Policy Conversion)" on page 420*
- *"Module "UPIS" (Unified Policy Infrastructure)" on page 421*

Flag	Description
`account`	*Currently is not used*
`address`	Information about connection's IP address
`btime`	*Currently is not used*
`clob`	Classification Object (CLOB) observer (data classification)
`connection`	Information about connections, transactions
`coverage`	Coverage times (entering, blocking, and time spent)
`error`	General errors
`info`	General information
`limit`	Unified Policy download and upload limits
`log`	Some logging operations
`mab`	Mobile Access handler
`manager`	Unified Policy manager operations
`match`	Classification Object (CLOB) observer (data classification)
`memory`	Memory allocation operations

Flag	Description
`module`	Operations in the Unified Policy module (initialization, module loading, calls to the module, and so on)
`policy`	Unified Policy internal operations
`prob`	*Currently is not used*
`prob_impl`	Implied matched rules
`probtrc`	Rule matching flow In addition, must enable the "`info`" flag
`rulebase`	Unified Policy rulebase
`sec_rb`	Secondary NRB rulebase operations
`stats`	Statistics about connections, transactions
`subject`	Prints the debug subject of each debug message
`timestamp`	Prints the timestamp for each debug message (changes when you enable the debug flag '`coverage`')
`urlf_ssl`	*Currently is not used*
`verbose`	Prints additional information (used with other debug flags)
`vpn`	VPN classifier
`vs`	Prints the VSID of the debugged Virtual System
`warning`	General warnings

Module "upconv" (Unified Policy Conversion)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m upconv + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m upconv + {all | <List of Debug Flags>}
```

Note - In addition, see:

- *"Module "UP" (Unified Policy)" on page 418*
- *"Module "UPIS" (Unified Policy Infrastructure)" on page 421*

Flag	Description
`error`	General errors
`info`	General information
`map`	UTF-8 and UTF-16 characters conversion
`mem`	Prints how much memory is used for character sets
`tree`	Lookup of characters
`utf7`	Conversion of UTF-7 characters to a Unicode characters
`utf8`	Conversion of UTF-8 characters to a Unicode characters
`warning`	General warnings

Module "UPIS" (Unified Policy Infrastructure)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m UPIS + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m UPIS + {all | <List of Debug Flags>}
```

Note - In addition, see:

- *"Module "UP" (Unified Policy)" on page 418*
- *"Module "upconv" (Unified Policy Conversion)" on page 420*

Flag	Description
`address`	Information about connection's IP address
`clob`	Classification Object (CLOB) observer (data classification)
`coverage`	Coverage times (entering, blocking, and time spent)
`cpdiag`	CPDiag operations
`crumbs`	*Currently is not used*
`db`	SQLite Database operations
`dnd`	Processing of Dynamic & Domain objects
`error`	General errors
`fwapp`	Information about policy installation for the FireWall application
`info`	General information
`initialapp`	Information about the Initial Install Policy App
`memory`	Memory allocation operations
`mgr`	Policy installation manager
`module`	Operations in the Unified Policy Infrastructure module (initialization, module loading, calls to the module, and so on)

Flag	Description
`mutex`	Unified Policy internal mutex operations
`policy`	Unified Policy Infrastructure internal operations
`report`	Various reports about Unified Policy installations
`sna`	Operations on SnA objects ("Services and Application")
`subject`	Prints the debug subject of each debug message
`tables`	Operations on kernel tables
`timestamp`	Prints the timestamp for each debug message (changes when you enable the debug flag '`coverage`')
`topo`	Information about topology and Anti-Spoofing of interfaces; about Address Range objects
`upapp`	Information about policy installation for Unified Policy application
`update`	Information about policy installation for CMI Update application
`verbose`	Prints additional information (used with other debug flags)
`vpn`	VPN classifier
`vs`	Prints the VSID of the debugged Virtual System
`warning`	General warnings

Module "VPN" (Site-to-Site VPN and Remote Access VPN)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m VPN + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m VPN + {all | <List of Debug Flags>}
```

Flag	Description
`cluster`	Events related to cluster
`comp`	Compression for encrypted connections
`counters`	Various status counters (typically for real-time Monitoring)
`cphwd`	Traffic acceleration issues (in hardware)
`driver`	Check Point kernel attachment (access to kernel is shown as log entries)
`err`	Errors that should not happen, or errors that critical to the working of the VPN module
`gtp`	Processing of GPRS Tunneling Protocol (GTP) connections **Note** - In addition, see *"Module "gtp" (GPRS Tunneling Protocol)" on page 390*
`ifnotify`	Notifications about the changes in interface status - up or down (as received from OS)
`ike`	Enables all IKE kernel debug in respect to moving the IKE to the interface, where it will eventually leave and the modification of the source IP of the IKE packet, depending on the configuration
`ike_trace`	Processing of IKE Security Associations
`iked`	Processing of IKE packets in the IKED daemon
`iked_trap`	Processing of IKE packets in the IKED daemon
`init`	Initializes the VPN kernel and kernel data structures, when kernel is up, or when policy is installed (in addition, it prints the values of the flags that are set using the `CPSET` upon policy reload)

Flag	Description
`l2tp`	Processing of L2TP connections
`lsv`	Large Scale VPN (LSV)
`mem`	Allocation of VPN pools and VPN contexts
`mspi`	Information related to creation and destruction of MSA / MSPI
`multicast`	VPN multicast
`multik`	Information related to interaction between VPN and CoreXL **Notes:** ■ In a cluster, enable the debug flag "`multik`" in the *"Module "cluster" (ClusterXL)" on page 361*. ■ If you use the QoS Software Blade, enable the debug flag "`multik`" in the *"Module "fg" (FloodGate-1 - QoS)" on page 379*.
`nat`	NAT issues , cluster IP manipulation (Cluster Virtual IP address <=> Member IP address)
`om_alloc`	Allocation of Office Mode IP addresses
`osu`	Cluster Optimal Service Upgrade (see sk107042)
`packet`	Events that can happen for every packet, unless covered by more specific debug flags
`pcktdmp`	Prints the encrypted packets before the encryption Prints the decrypted packets after the decryption
`policy`	Events that can happen only for a special packet in a connection, usually related to policy decisions or logs / traps
`queue`	Handling of Security Association (SA) queues
`rdp`	Processing of Check Point RDP connections
`ref`	Reference counting for MSA / MSPI, when storing or deleting Security Associations (SAs)
`resolver`	VPN Link Selection table and Certificate Revocation List (CRL), which is part of the peer resolving mechanism
`route`	Packet routing

Flag	Description
`rsl`	Operations on Range Skip List
`sas`	Information about keys and Security Associations (SAs)
`sr`	SecureClient / SecureRemote related issues
`tagging`	Sets the VPN policy of a connection according to VPN communities, VPN Policy related information
`tcpt`	Information related to TCP Tunnel (Visitor mode - FireWall traversal on TCP port 443)
`tnlmon`	VPN tunnel monitoring
`topology`	VPN Link Selection
`vin`	*Does not apply anymore* Only on Security Gateway that runs on Windows OS: Information related to IPSec NIC interaction
`warn`	General warnings

Module "WS" (Web Intelligence)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m WS + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m WS + {all | <List of Debug Flags>}
```

Notes:

- In addition, see *"Module "WSIS" (Web Intelligence Infrastructure)" on page 431*.
- To print information for all Virtual Systems in the debug output, before you start the kernel debug, set this kernel parameter on the VSX Gateway or each VSX Cluster Member (this is the default behavior):

```
# fw ctl set int ws_debug_vs 0
```

- To print information for a specific Virtual System in the debug output, before you start the kernel debug, set this kernel parameter on the VSX Gateway or each VSX Cluster Member:

```
# fw ctl set int ws_debug_vs <VSID>
```

- To print information for all IPv4 addresses in the debug output, before you start the kernel debug, set this kernel parameter on the VSX Gateway or each VSX Cluster Member (this is the default behavior):

```
# fw ctl set int ws_debug_ip 0
```

- To print information for a specific IPv4 address in the debug output, before you start the kernel debug, set this kernel parameter on the VSX Gateway or each VSX Cluster Member:

```
# fw ctl set int ws_debug_ip <XXX.XXX.XXX.XXX>
```

Flag	Description
`address`	Information about connection's IP address
`body`	HTTP body (content) layer
`connection`	Connection layer
`cookie`	HTTP cookie header
`coverage`	Coverage times (entering, blocking, and time spent)

Flag	Description
`crumb`	*Currently is not used*
`error`	General errors (the connection is probably rejected)
`event`	Events
`fatal`	Fatal errors
`flow`	*Currently is not used*
`global`	Handling of global structure (usually, related to policy)
`hpack`	Processing of HTTP/2 HPACK header compression
`http2`	Processing of HTTP/2 packets
`info`	General information
`ioctl`	IOCTL control messages (communication between the kernel and daemons, loading and unloading of the FireWall)
`mem_pool`	Memory pool allocation operations
`memory`	Memory allocation operations
`module`	Operations in the Web Intelligence module (initialization, module loading, calls to the module, policy loading, and so on)
`parser`	HTTP header parser layer
`parser_err`	HTTP header parsing errors
`pfinder`	Pattern finder
`pkt_dump`	Packet dump
`policy`	Policy (installation and enforcement)
`regexp`	Regular Expression library
`report_mgr`	Report manager (errors and logs)
`session`	Session layer
`spii`	Stateful Protocol Inspection Infrastructure (INSPECT streaming)
`ssl_insp`	HTTPS Inspection

Flag	Description
`sslt`	SSL Tunneling (SSLT)
`stat`	Memory usage statistics
`stream`	Stream virtualization
`subject`	Prints the debug subject of each debug message
`timestamp`	Prints the timestamp for each debug message (changes when you enable the debug flag '`coverage`')
`uuid`	Session UUID
`vs`	Prints the VSID of the debugged Virtual System
`warning`	General warnings

Module "WS_SIP" (Web Intelligence VoIP SIP Parser)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m WS_SIP + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m WS_SIP + {all | <List of Debug Flags>}
```

Flag	Description
`address`	Information about connection's IP address
`body`	HTTP body (content) layer
`connection`	Connection layer
`cookie`	HTTP cookie header
`coverage`	Coverage times (entering, blocking, and time spent)
`crumb`	*Currently is not used*
`error`	General errors
`event`	Events
`fatal`	Fatal errors
`flow`	*Currently is not used*
`global`	Handling of global structure (usually, related to policy)
`hpack`	Processing of HTTP/2 HPACK header compression
`http2`	Processing of HTTP/2 packets
`info`	General information
`ioctl`	IOCTL control messages (communication between the kernel and daemons, loading and unloading of the FireWall)
`mem_pool`	Memory pool allocation operations
`memory`	Memory allocation operations

Flag	Description
`module`	Operations in the Web Intelligence VoIP SIP Parser module (initialization, module loading, calls to the module, policy loading, and so on)
`parser`	HTTP header parser layer
`parser_err`	HTTP header parsing errors
`pfinder`	Pattern finder
`pkt_dump`	Packet dump
`policy`	Policy (installation and enforcement)
`regexp`	Regular Expression library
`report_mgr`	Report manager (errors and logs)
`session`	Session layer
`spii`	Stateful Protocol Inspection Infrastructure (INSPECT streaming)
`ssl_insp`	HTTPS Inspection
`sslt`	SSL Tunneling (SSLT)
`stat`	Memory usage statistics
`stream`	Stream virtualization
`subject`	Prints the debug subject of each debug message
`timestamp`	Prints the timestamp for each debug message (changes when you enable the debug flag '`coverage`')
`uuid`	Session UUID
`vs`	Prints the VSID of the debugged Virtual System
`warning`	General warnings

Module "WSIS" (Web Intelligence Infrastructure)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m WSIS + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m WSIS + {all | <List of Debug Flags>}
```

Note - In addition, see *"Module "WS" (Web Intelligence)" on page 426*.

Flag	Description
`address`	Information about connection's IP address
`cipher`	*Currently is not used*
`common`	Prints a message, when parameters are invalid
`coverage`	Coverage times (entering, blocking, and time spent)
`crumb`	Information about connections
`datastruct`	Data structure tree
`decoder`	Decoder for the content transfer encoding (UUEncode, UTF-8, HTML encoding &#)
`dump`	Packet dump
`error`	General errors
`flow`	*Currently is not used*
`info`	General information
`memory`	Memory allocation operations
`parser`	HTTP header parser layer
`subject`	Prints the debug subject of each debug message
`timestamp`	Prints the timestamp for each debug message (changes when you enable the debug flag '`coverage`')

Flag	Description
`verbose`	Prints additional information (used with other debug flags)
`vs`	Prints the VSID of the debugged Virtual System
`warning`	General warnings

Module "ZPH" (Zero Phishing)

Syntax

- On the Security Gateway / each Cluster Member, run in the Expert mode:

```
fw ctl debug -m ZPH + {all | <List of Debug Flags>}
```

- On the Scalable Platform Security Group, run in the Expert mode:

```
g_fw ctl debug -m ZPH + {all | <List of Debug Flags>}
```

Flag	Description
`address`	Information about connection's IP address
`coverage`	Coverage times (entering, blocking, and time spent)
`error`	General errors
`global`	*Currently is not used*
`info`	General information
`memory`	Memory allocation operations
`module`	General information about the Zero Phishing kernel module
`nemo`	*Currently is not used*
`subject`	Prints the debug subject of each debug message
`timestamp`	Prints the timestamp for each debug message (changes when you enable the debug flag '`coverage`')
`verbose`	Prints additional information (used with other debug flags)
`vs`	Prints the VSID of the debugged Virtual System
`warning`	General warnings
`zphi`	*Currently is not used*
